- **Hydro Fluoro Carbons to protect ozone depletion:** The 1987 Montreal Protocol banned industrial chemicals (CFCs) dissolving stratospheric ozone, which protects us from the Sun's dangerous ultraviolet rays. To replace the forbidden molecules, used in aerosols and refrigerants, scientists invented a new category known as HFCs.
- **Challenges posed:** But there was a small problem that didn't emerge until much later: the substitutes—while harmless to the ozone layer—were **dangerous greenhouse gases**, thousands of times more potent than carbon dioxide or methane. That meant a new, protracted round of negotiations over an amendment calling for the phase of HFCs, which was finally adopted in 2016.
- **Bio-fuels:** The rise in oil prices in the 1970s, and later the looming threat of climate change, boosted the production of bio-fuels made from corn, sugarcane and palm oil. It seemed like a great idea: planet-warming CO₂ released into the atmosphere when the bio-fuels were burned would be partially offset by the CO₂ absorbed while the plants were growing.
- **Challenges posed:** The energy needed to transform and transport plant-based fuels undercuts their original purpose. To make matters worse, the newly emerging market created a perverse incentive to cut down tropical forests—far more efficient at soaking up CO₂—to make way for sugarcane and palm oil trees. When it comes to climate change, projections for how humanity can cap global warming under two degrees Celsius (3.6 degrees Fahrenheit) assume a major role for bio-fuels. But recently scientists have calculated that an area up to twice the size of India would be needed to cultivate them, which may not leave enough land to grow food.
- **Wind farms:** There are some 350,000 wind turbines scattered across the globe producing more than 500 gigawatts of clean, green energy and supplying four percent of global electricity demand.
- **Challenges posed:** But wind farms are also bird killers: up to 328,000 birds—especially those that fly at night—are felled every year by fast-spinning blades in the United States alone, where there are some 50,000 turbines. They also **disrupt ecosystems**.
- **Case Study:** A scientific study of **wind farms in the Western Ghats**, a UNESCO-listed range of mountains and forest spanning India's west coast, found that predatory raptor birds were four times rarer than in adjacent areas. Their absence cascaded down the food chain and radically altered the density and behaviour of the birds' prey. There was, in particular, an explosion in the raptors' favourite meal: fan-throated lizards.
- **Solar energy:** Photovoltaic solar panels absorb sunlight to generate electricity. This has powered many homes in developing and under-developed countries. It has shown the potential to reduce the consumption of coal for electricity generation.
- **Challenges posed:** However, the solar panels pose a challenge. A study by French investigative journalist Guillaume Pitron reveals this. The fastest growing renewable energy source includes critical metals and minerals that require a lot of energy to extract and often leave a trail of environmental devastation in their wake. Wandering the world to research his book "The Rare Metals War", Pitron said he saw mountains in southern China "cut in half vertically," and "toxic lakes" in Inner Mongolia.

Conclusion:

The need of the hour is to create solutions that are sustainable. The solutions themselves shouldn't pose further challenges, easily scalable and cost saving. Better Research and Development techniques with right validation is the way ahead before deployment on large scale.

What is ancient DNA (aDNA) and what has it been used to study? Analyse and discuss the utility of it.(250 words)

The hindu

Introduction:

Ancient DNA (aDNA) is DNA isolated from ancient specimens. Due to degradation processes (including cross-linking, deamination and fragmentation) ancient DNA is of more degraded in comparison with contemporary genetic material. Even under the best preservation conditions, there is an upper boundary of 0.4–1.5 million years for a sample to contain sufficient DNA for sequencing technologies. Genetic material has been recovered from paleo/archaeological and historical skeletal material, mummified tissues, archival collections of non-frozen medical specimens, preserved plant remains, ice and from permafrost cores, marine and lake sediments and excavation dirt.

Body:

aDNA is used to study:

- Ancient DNA can be carefully extracted from archaeologically recovered bones, teeth or fossil plant remains.
- Small fragments are processed to sequence the genome of those ancient organisms.
- aDNA becomes degraded, on account of its age and the climatic and soil conditions it was buried in.
- Techniques developed over the past three decades have led to a revolution in how we understand the evolution and genetic history of a range of animals and plants, including species that are extinct today.
- Palaeogeneticists have been able to establish how genetic variation might relate to the independent evolution of species on different continents that were previously thought to be related, or how different subspecies of horses emerged after their domestication, or how populations that today appear distinct and in different geographical areas were once related and likely existed together in one region.

Utility of aDNA from human samples:

- To understand the genetic predisposition towards certain diseases and responses to medicines in different social groups in South Asia.
- The comparison of aDNA samples with other aDNA and modern DNA databases can reveal otherwise unsuspected genetic histories.
- Researchers can trace the deep ancestry of ancient individuals and assess how their genetic makeup is distinct on account of specific variant genes (alleles), mutations and other markers and see how this compares with that of modern groups.
- Thus, the most common way of understanding the relatedness of DNA between groups and individuals is by their admixture percentages.

Case study: Ancient DNA samples of Rakhigarhi:

The journal Cell published a paper, An Ancient Harappan Genome Lacks Ancestry from Steppe Pastoralists and Iranian Farmers, which claimed that the inhabitants of the Indus Valley Civilisation lacked the steppe-pastoralist ancestry which had brought Indo-European languages into South Asia.

Another paper, published in the journal Science by the same authors and others, established baselines for the DNA of South and Central Asian populations over the last 10,000 years.

Key facts:

- The paper concludes Indians came from a genetic pool predominantly belonging to an indigenous ancient civilisation.
- The findings are based on the study of the ancient genome in the skeletons excavated from a burial site at Rakhigarhi, which is among the biggest Indus Valley locations, spread across 300 hectares near Hisar.
- It belongs to the mature phase of the Harappan period, dating back to about 2800-2300 BC.
- The paper claims Iranian genetic traits in the Indus Valley period and in present day South Asians come from ancient Iranian and South East Asian hunter-gatherers, much before the advent of large-scale farming.
- According to paper, The Iranian related ancestry in IVC derives from a lineage leading to early Iranian farmers, herders and hunter-gatherers before their ancestors separated, contradicting the hypothesis that the shared ancestry between early Iranians and South Asians reflects a large-scale spread of western Iranian farmers' east.
- Instead, sampled ancient genomes from the Iranian plateau and IVC descend from different groups of hunter gatherers who began farming without being connected by substantial movement of people.
- The paper claims: "Multiple lines of evidence suggest the genetic similarity of I6113 (the Rakhigarhi burial DNA) to the Indus Periphery Cline individuals is due to gene flow from South Asia rather than in the reverse direction."

What are Organoids? Discuss the role played by them in helping to understand diseases better. Also explain ethical challenges associated with them.(250 words)

The hindu

Why this question:

Recently, at Neuroscience 2019, the Society for Neuroscience's 49th annual meeting, held in Chicago, U.S., two neuroscientists warned the gathering that fellow scientists are "perilously close" to crossing the ethical red line of growing mini-brains or Organoids in the laboratory that can perceive or feel things.

Key demand of the question:

One has to discuss the concept of Organoids in detail, its advantages and disadvantages along with the critical analysis of the ethical concerns involved.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Define what Organoids are.

Body:

Explain that Organoids are a group of cells grown in laboratories into three-dimensional, miniature structures that mimic the cell arrangement of a fully-grown organ. They are tiny (typically the size of a pea) organ-like structures that do not achieve all the functional maturity of human organs but often resemble the early stages of a developing tissue.

Discuss their salient features.

Explain how Organoids are grown in the laboratory?

Discuss the ethical concerns involved.

Conclusion:

Conclude with way forward.

Introduction:

Organoids are a group of cells grown in laboratories into three-dimensional, miniature structures that mimic the cell arrangement of a fully-grown organ. They are tiny (typically the size of a pea) organ-like structures that do not achieve all the functional maturity of human organs but often resemble the early stages of a developing tissue. Most organoids contain only a subset of all the cells seen in a real organ, but lack blood vessels to make them fully functional. In the case of brain organoids, scientists have been able to develop neurons and even make specific brain regions such as the cerebral cortex that closely resemble the human brain. The largest brain organoids that have been grown in the laboratory are about 4 mm in diameter.

Body:

Role of Organoids in understanding diseases:

- Organoids offer new opportunities to studying proteins and genes that are critical for the development of an organ.
- This helps in knowing how a mutation in a specific gene causes a disease or disorder.
- In a study in Europe using intestinal organoids from six patients with an intestine disorder, it became possible to identify the mutation in a gene that prevented the formation of a healthy intestine.
- Researchers have used brain organoids to study how the Zika virus affects brain development in the embryo.
- Scientists are already using stem cells taken from tumours to grow organoids that are poised to develop cancer.
- The ability to grow organoids using cancer stem cells allows researchers to study the genes, proteins and signalling pathways that cancer cells use to develop and grow.
- They are also using healthy organoids to identify and verify the gene mutations that cause cancer.

Other benefits:

- Organoids can be used to study the safety and efficacy of new drugs and also test the response of tissues to existing medicines.

- Organoids will bring precision medicine closer to reality by developing patient-specific treatment strategies by studying which drugs the patient is most sensitive to.
- Since the use of animals during drug development studies is becoming increasingly difficult, the focus has been on refining, reducing and replacing them.
- While scientists have been increasingly using human cell lines and other methods, such alternatives have some inherent limitations — they cannot mimic the whole organ system.
- Organoids are a far superior alternative to cell lines.

Ethical concerns posed:

- In some cases, scientists have already transplanted such lab-grown brain organoid to adult animals.
- These are seen as a step towards **potential “humanisation” of host animals**.
- Scientists argue that organoids **do not have sensory inputs and sensory connections** from the brain are limited.
- Isolated regions of the brain cannot communicate with other brain regions or generate motor signals.
- Thus, the possibility of consciousness or other higher-order perceptive properties, such as the ability to feel distress, emerging seems extremely remote.

Conclusion:

Despite organoids providing bright prospects which can change the future of medicine and technology in medicine, the associated concerns must be tackled at the earliest.

What are Nano pharmaceuticals? Discuss their key features and elucidate on the role played by them in extending the economic life of proprietary drugs. (250 words)

Livemint

Why this question:

Recently, Guidelines were released for Evaluation of Nano pharmaceuticals in India.

Key demand of the question:

Explain what are Nano pharmaceuticals, their utility, advantages and possible concerns.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define what Nano pharmaceuticals are.

Body:

Nano pharmaceuticals represent an emerging field where the sizes of the drug particle or a therapeutic delivery system work at the Nano scale.

Describe briefly the recently launched guidelines.

Explain the significance of such guidelines.

Bring out the applications of Nano pharmaceuticals.

Conclusion:

Conclude with advantages; suggest that Nano pharmaceuticals have the ability to extend the economic life of proprietary drugs, thereby creating additional revenue streams.

**Introduction:**

Nano pharmaceuticals are a relatively new class of therapeutic-containing nanomaterials that often have unique “nanoproperties” (physiochemical properties) due to their small size (compared with their bulk-phase counterparts) a high surface-to-volume ratio and the possibility of modulating their properties. Recently, the Government of India released “Guidelines for Evaluation of Nano-pharmaceuticals in India”.

Body:**Nano-pharmaceuticals key features:**

- A Nano-material can be defined as material having a particle size in the range of 1 to 100 nm in at least one dimension.
- Nano-formulations are not entirely new drugs but medicines that have better quality because of the technology-led delivery mechanisms that are used to make its administration in the body more effective.
- Nanopharmaceuticals are rapidly emerging sub-branch that deals with the drug-loaded nanocarriers or nanomaterials that have unique physicochemical properties and minute size range for penetrating the Central Nervous system
- Nano-pharmaceuticals can be tailored with functional modalities to achieve active targeting to the brain tissues.
- The magic behind their therapeutic success is the reduced amount of dose and lesser toxicity, whereby localizing the therapeutic agent to the specific site.
- **Role played by them in extending the economic life of proprietary drugs:**
 - They present novel reformulation opportunities for active agents (e.g., single molecule drugs, proteins, nucleic acids, etc.) that were previously insoluble or could not be targeted to a specific site of the body where they were needed.
 - Nano-pharmaceuticals can also increase drug half-life by reducing immunogenicity and diminishing drug metabolism.
 - They are expected to bring about a revolution in treatment strategies as they would enable targeting specific delivery of drugs and therapeutic molecules.
 - They offer higher efficacy and lower toxicity in many disease conditions.
 - They are expected to be of great use particularly in cancer treatment.
 - With these advantages, nano-pharmaceuticals have the ability to extend the economic life of proprietary drugs, thereby creating additional revenue streams.

Conclusion:

Nanopharmaceuticals have enormous potential in addressing this failure of traditional therapeutics which offers site-specific targeting of active agents. Such precision targeting via nanopharmaceuticals reduces toxic systemic side effects, resulting in better patient compliance.

When used sensibly, Big data can save lives and help build better future citizens. Explain with suitable illustrations.(250 words)

Reference

Why this question:

The article highlights the importance of Big data as a technology for building better future for citizens.

Key demand of the question:

Bring out the significance of Big Data as a technology. Its applications in detail.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In brief define what Big Data is and explain its evolution.

Body:

Explain first the relevance of Big Data and its emergence as a powerful tool.

Mention the significance of Big Data in India.

Then move on to discuss how big data can help vulnerable people manage their health and lives.

List down the applications of Big Data ranging from governance, economy, disaster management etc.

Conclusion:

Conclude with way forward.

Introduction:

Big data is a term for data sets that are so large or complex that traditional data processing application software is inadequate to deal with them. Almost 90% of the world's data today was generated during the past two years. "Big data" refers to the use of predictive analytics, user behavior analytics, or certain other advanced data analytics methods that extract value from data. Big data can be understood as the consolidation and centralization of public data inputs from various spheres of activities like commercial, consumer based, census, or even Aadhar controlled personal information.

Body:

The six Vs of big data

Big data is a collection of data from various sources, often characterized by what's become known as the 3Vs: *volume*, *variety* and *velocity*. Over time, other Vs have been added to descriptions of big data:

| VOLUME | VARIETY | VELOCITY | VERACITY | VALUE | VARIABILITY |
|---|---|---|---|---|---|
| The amount of data from myriad sources. | The types of data: structured, semi-structured, unstructured. | The speed at which big data is generated. | The degree to which big data can be trusted. | The business value of the data collected. | The ways in which the big data can be used and formatted. |
|  |  |  |  |  |  |

Big data can be used in a variety of applications which can help build better future for citizens.

Good Governance:

- Big data with the government is a huge boon for governance.
- Consumer habits can be studied and policies can be framed which would then be in line with the need of the hour.
- Patterns of investment, savings and expenditure can be revisited with changing time and government can instil such changes in its policies.
- Security of the state can be further enhanced by access to larger data.
- Transforming government programmes and empowering citizens to improving transparency and enabling the participation of all stakeholders.
- Geo-tagging in MGNREGA can help analyse the effectiveness of the policy geographically and bring in required changes.
- The Digital India and Smart Cities initiatives of the government also include efforts to utilise data to design, plan, implement, manage, and govern programmes.

Economy:

- Big data can provide huge benefits to various sectors of the economy like,
- In Insurance Sector to improve customer experience & ensure their right to claim
- In Banking Sector to manage financial data
- To capture the production, price statistics, & calculate the resultant GDP
- Evade risks & minimize losses for financial firms
- Tax officials catching hold the tax evaders using Project Insight

Health Care: Big Data in health care caters the following benefits:

- Predicting diseases,
- Prescribing medicines,
- Optimizing treatment,
- Using clinical data to improve patient care,
- In critical Diagnostic tests,
- Finding new cures (R&D)

Agriculture and Food:

- Seed Selection
- Geo-Tagging to keep the track record of agricultural assets in the country
- Weather Forecasting
- Irrigation & effective water management
- Food Processing
- Identification of Crop Diseases

Digital Space:

- In the telecom sector- connecting the hinterland areas and bringing them to the mainstream,
- On Social Media for targeting platform users,
- Artificial Intelligence – Controlling home appliances,
- Analysing & Improving individual performance (at work, sports, or home) using wearable devices.

Way forward:

- Ethical issues related to data privacy need to get addressed.
- Data protection law must incorporate some of the best practices followed in the World.
- It must strengthen cybersecurity in order to safely utilize the large pool of virtually available data.
- Economically, the alliance of big data with blockchain technology will potentially change the way we see big data for now.
- To effectively analyse the large chunks of available data, well-equipped data centres are needed. It is essential to segregate the relevant data from the irrelevant data pool.
- In a world where most of the governments & businesses rely more on new-age data sources such as satellite imagery, parking images, and night lights, Big Data governance could be a game-changer for India, where policies have for long been under-implemented.

**Conclusion:**

The big data revolution is in its early days and most of the potential for value creation is still unclaimed. But it has set the industry on a path of rapid change and new discoveries. Stakeholders committed to innovation will likely be the first to reap rewards. If the farmers would have been concerned about the infirmities in terms of data-based farming, production could be increased.

INSIGHTSIAS

Awareness in the fields of IT, Space, Computers, robotics, nano-technology, bio-technology and issues relating to intellectual property rights.

Artificial Intelligence, is it an end to human miseries or an end to humanity itself?

Critically analyse.(250 words)

The hindubusinessline

Introduction:

Artificial Intelligence (AI) brings in a host of real-world applications which had earlier merely been a subject of science fiction novels or movies. The breakthroughs such as the Weather Company's to be launched, **the GRAF model** capable of predicting a thunderstorm virtually anywhere on the planet every hour and other such applications are useful. AI has made inroads to automation and decision support systems to complement or augment human abilities.

Body:

AI is being widely used today as shown below

- AI enhances the ability of computer systems to learn from their experiences over time, makes them capable of reasoning, perceiving relationships and analogies, helps solve problems, as well as respond in natural languages and adapt to new conditions.
- AI allows machines to sense and comprehend their surroundings and act according to their own intelligence or learning.
- **Governance:**
 - As India is poised for reforms in governance, AI can actually help with process optimization and cost savings for the government, in addition to solving some strategic problems or assisting in decision making.
- **Economy:**
 - Economic growth is vital for development, and the next generation of economic growth is anticipated to be fuelled by technologies relating to big data, block chain, quantum computing and AI. These game changing technologies will spur innovation, create value for the investors, generate specialized job domains and as a result, propel economic growth.
 - Issues such as tax evasion, money laundering etc can be easily addressed using AI.
 - 68% of Indian business decision-makers believe AI will help their business in various ways such as boosting productivity, generating growth and addressing societal issues
 - India has one of the world's largest automotive industries, with a significant production and consumption base. AI applications have vast scope in the automotive sector, ranging from enhancing fuel efficiency to passenger safety to the concept of self-driving vehicles.
- **Healthcare:**
 - Healthcare sector in India is burgeoning with innovation and demand, having business models unique to the Indian requirements and spending power.

- AI can augment the potential of government and private sector to deliver healthcare services and products with improved drug safety, better diagnosis and analysis of clinical reports for preventive and accurate treatment.
- **Defence:**
 - More advanced applications of AI extend to the domains of foreign, defence and security policies. Deep learning in AI can unravel futuristic functions by augmenting decision making ability of the humans with access to the information derived from large data sets.
- **Security:**
 - AI has many peace time applications as well. It can be used to train soldiers and pilots, simulate war-game, synthesize information from surveillance systems and address critical problems in optimizing logistics, fleet management and maintenance
 - Vision and Voice systems to interpret and comprehend visual inputs such as images, clinical diagnosis and facial recognition or voice inputs to recognize the source of the sound.
 - Law enforcement or internal security requirements for detecting and recognizing individuals or criminals, with multitudes of data streaming from police databases or the network of surveillance cameras.
 - Banking and financial services for fraud detection using advanced algorithms to identify patterns in transactions and consumer behaviours which are risk prone.
 - AI is also helping insurance providers arrive at better risk assessment.
- Countries such as India can benefit a lot from the use of AI by focusing on sectors such agriculture, manufacturing, infrastructure etc.

Concerns and Risks:

- The armed forces of US and China have already invested billions of dollars to develop LAWS, intending to gain strategic and tactical advantage over each other. This runs the risks of an arms race.
- There is no clearly stated policy document or vision statement for AI development.
- AI has to meet the first and foremost challenge of acceptability with the users from the government, public sector and the armed forces, or even the private sector.
- As users of AI, their interest in the technology augmenting their own ability, and not posing a threat, is quite pertinent.
- Technical competence in this fast-paced sector, primarily in the case of government, could be a road block.
- AI can better adapt to the goals and expectations of the Indian decision makers, if the technology development is indigenous. Foreign dependence in this case would be detrimental and unproductive.
- AI has set off an **economic and technological competition**, which will further intensify.

- **LAWs** operate without human intervention, and there is formidable challenge in distinguishing between combatants and non-combatants, which is a subject of human judgment.
- **AI powered bots** have also been used to influence humans perceptions, views and opinions. Such activities are rampantly being promoted through social media platforms for various ulterior purposes using fake news, unethical advertisements, etc which then have huge negative consequences.
- **AI based weapons** are fast gaining currency. Since humans can be replaced by such machines, declaring war would become more convenient. These machines can wreck havoc if uncontrolled endangering the human race itself.
- AI is being used for **extensive surveillance** as in China which violates right to privacy. Such intelligence can be even used to selectively target and eliminate opponents which instil deep fear among people who would like to raise voice against injustice.
- Humans can pass on their limitations to robots. E.g.: biases, prejudices, discrimination, etc. A recent report in USA revealed that robot can be racist.

Conclusion:

“The greatest enemy of knowledge is not ignorance, it is the illusion of knowledge” was what **Stephen Hawking** said. The transformative capability of AI in India is huge, and must be rooted in an egalitarian ethical basis. Any institutional framework for AI should have a multidisciplinary and multi-stakeholder approach, and have an explicit focus on the ethical basis.

Do you think it is imperative that India’s legal prowess be applied to the situational complexities of space exploration? Discuss in the backdrop of world’s first space crime. (250 words)

The hindu

Why this question:

The article discusses in detail the need for legal system in addressing any crimes arising out of space.

Key demand of the question:

One must bring out and reason with substance the need to have a legal system to address situational complexities of space exploration.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

One can start by highlighting the space race that the world countries are into.

Body:

First discuss how far world countries have come in terms of space explorations and what has made space exploration systems complex to address.

Explain that it is time to answer the questions like – What will happen when legal issues that are beyond the foresight of existing agreements arise? What will happen when crimes take place on commercial space vehicles sent by private corporations, third-party nations, and jurisdictions not already covered?

Conclusion:

Conclude with way forward.

**Introduction:**

It was recently reported that the “world’s first space crime” may have been committed by a NASA astronaut, Anne McClain. She is suspected of signing into the personal bank account of her estranged spouse from a computer aboard the International Space Station (ISS). In this context, it is necessary to understand the ambit of space laws, issues in this relation and way forward.

Body:**The case of Anne McClain:**

- Currently, there is no detailed framework for international space law nor is there any way to handle criminal disputes that arise on commercial space vessels.
- It gets even less defined when it comes to disputes between individuals from separate countries.
- Our only outer space presence comes from the International Space Station, which is currently governed under an international treaty called the **Intergovernmental Agreement (IGA) on Space Station Cooperation**.
- Article 22 of the Agreement concerns itself with criminal jurisdiction and states that countries which are mentioned in the agreement may exercise criminal jurisdiction over personnel in flights who are their respective nationals.
- Hence, the laws of the U.S. will be applicable in this situation concerning the first space crime.
- There are legal documents that govern space, such as the Outer Space Treaty, the Moon Agreement, the Registration Convention, the Rescue Agreement, and the Liability Convention, none of them comprehends a detailed framework to cater to criminal disputes that might arise on commercial space vessels, which will have personnel and space tourists from different jurisdictions.

Issues persist:

- NASA has recently announced the opening of the ISS for commercial uses like filming etc. which can naturally give rise to crimes committed in outer space.
- India is presently not a party of IGA but will have to become considering its ambitious projects like the Gaganyaan etc.
- If so, India will have to include provisions relating to offences in space in the Indian Penal Code, as that could be material in situations involving outer space, Indian citizens, and space equipment.

Way forward:

- Thus it is opined that India’s legislature should proactively legislate on this front and remain apace in space exploration missions.
- India might also need to formulate new international agreements on space, or sign MOUs to that effect.

- It is imperative, therefore, that India's legal prowess is therefore applied urgently and rigorously to the situational complexities of space exploration.
- Only by keeping pace with the explosive growth in space technology can India hope to remain at the forefront of scientific development in this exciting field.
- More comprehensive international codes and legislation will need to be drafted and thought up as space becomes increasingly more populated.

Espionage activities through the use of digital tools are increasing in the recent past, in this context discuss the need for India to invest and recruit heavily in counter-measures against social media espionage. (250 words)

The hindu

Why this question:

Espionage activities through the use of digital tools are increasing in the recent past. The article presents a detailed discussion on the same.

It was recently found out that a spy from Pakistan had managed to get access to secret and crucial information pertaining to Indian security through the means of honey-trap by using social media.

Key demand of the question:

Discuss the emergence of espionage and other methods of cyber terrorism with the coming of newer digital tools and the urgency to curb them.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief narrate what are Espionage activities.

Body:

Discuss the emergence of espionage activities with increasingly coming of digital tools – for example explain what Honey trap is? – It is an investigative practice involving the use of romantic or sexual relationships for interpersonal, political, or monetary purpose.

Discuss what are the challenges involved.

Explain what measures need to be taken.

Role of government agencies and other stakeholders.

Conclusion:

Conclude with way forward.

Introduction:

Cyber espionage, is "the act or practice of obtaining secret information without the permission of the holder of

the information (personal, sensitive, proprietary or of classified nature), from individuals, competitors, rivals, groups, governments and enemies for personal, economic, political or military advantage using methods on the

Internet, networks or individual computers through the use of cracking techniques and malicious software including Trojan horses and spyware." Simply said, Cyber espionage is "The use of computer networks to gain illicit access to confidential information, typically that held by a government or other organization."

Body:

honey-trap cases are a weapon of hybrid warfare being waged by the enemy across the borders.

Instances of Cyber Espionage:

- Using social media profile, by infecting their lives and devices. The second is to find someone on adult sites and inject malware into their phones and computers. According to reports, three of the world's 20 most visited websites are pornographic-related sites.
- It is important to note that 25% of all Android malware is porn-related. A 2017 study found that a hacker collective known as KovCoreG had been targeting millions of users of the site Pornhub, tricking them into installing viruses on their computers.
- Indian Army reported two cases of honey-trapping in 2015 and another two in 2017.
- The Indian Air Force reported one case in 2015, while the Navy did not report any.

Counter-Measures needed:

- An information warfare team is being set up at the Army headquarters.
- Suspected Twitter handles and Facebook accounts have also been identified.
- Investing in the latest technologies for early and better detection of viruses.
- Conducting frequent workshops to sensitise defence personnel against cyber risks.
- Conducting timely reviews and audits of all devices; developing better protocols in the event of contamination.
- Developing a methodology to embed dormant malware in all sensitive data and devices which will be able to track the bad actors and destroy the documents with a programmed kill switch.
- Developing a doctrine to hit back. The Defence Cyber Agency should be leveraged towards this end.
- Best cyber practices must be built amongst fresh recruits.
- Reforms in Indian intelligence need to cover a lot of ground, especially in providing a firm legal basis to the agencies involved in the trade. But they must begin with a complete overhaul of the recruitment process.

Conclusion:

In this information age, the enemy will be relentless and continue to invest and recruit heavily in these methods. India needs to act fast to deter such threats.

Edge computing is the new future face of cloud computing. Elucidate while explaining the relevance of edge computing in the coming times. (250 words)

[Indianexpress](#)

Why this question:

The article suggests that By 2025, according to the global research and advisory firm Gartner, companies will generate and process more than 75% of their data outside of traditional centralized data centres — that is, at the “edge” of the cloud.

Key demand of the question:

The question expects us to elaborate on the new technology of edge computing and in what way it will be the new face of cloud.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Define what is edge computing? – Edge computing enables data to be analyzed, processed, and transferred at the edge of a network.

Body:

Explain the application of cloud computing first, and then discuss in what way edge computing is different from it.

Cloud computing — by which remote servers hosted on the Internet store and process data, rather than local servers or personal computers — is ready to move to the next level.

Amazon, Microsoft, and Alphabet, the parent company of Google — the technology giants that provide cloud computing infrastructure to major corporates and governments — want to leverage 5G wireless technology and artificial intelligence to enable faster response times, lower latency (ability to process very high volumes of data with minimal delay), and simplified maintenance in computing. This is where Edge Computing comes in — which many see as an extension to the cloud, but which is, in fact, different in several basic ways.

Quote relevant examples highlighting the uses of such applications.

Conclusion:

Conclude with way forward.

Introduction:

Edge computing enables data to be analysed, processed, and transferred at the edge of a network.

The idea is to analyse data locally, closer to where it is stored, in real-time without latency, rather than send it far away to a centralised data centre. So whether you are streaming a video on Netflix or accessing a library of video games in the cloud, edge computing allows for quicker data processing and content delivery.

Body:

Edge computing vis-à-vis Cloud computing:

- Edge Computing can be seen as an extension to the cloud, but which is, in fact, different in several basic ways.
- By 2025, says the global research and advisory firm Gartner, companies will generate and process more than 75% of their data outside of traditional centralised data centres — that is, at the “edge” of the cloud.
- At the moment, the existing Internet of Things (IoT) systems perform all of their computations in the cloud using data centres.
- **Edge computing**, on the other hand, essentially manages the massive amounts of data generated by IoT devices by storing and processing data locally.
- That data doesn’t need to be sent over a network as soon as it processed; only important data is sent — therefore, an edge computing network reduces the amount of data that travels over the network.
- Technologies such as 5G wireless technology and artificial intelligence enable faster response times, lower latency (delay), and simplified maintenance in computing.
- It is preferred over cloud computing in remote locations, where there is limited or no connectivity to a centralized location. These locations require local storage, similar to a mini data centre, with edge computing providing the perfect solution for it.

Relevance of Edge computing in coming days:

- Edge application services reduce the volumes of data that must be moved, the consequent traffic, and the distance that data must travel.
- That provides lower latency and reduces transmission costs. Computation offloading for real-time applications, such as facial recognition algorithms, showed considerable improvements in response times as demonstrated in early research.
- Further research showed that using resource rich machines near mobile users, called cloudlets, offering services typically found in the cloud, provided improvements in execution time when some of the tasks are offloaded to the edge node.
- For instance: Nvidia, one of the biggest players in the design and manufacture of graphics and AI acceleration hardware, has just announced its EGX edge computing platform to help telecom operators adopt 5G networks capable of supporting edge workloads.
- The new Nvidia Aerial software developer kit will help telecom companies build virtualised radio access networks that will let them support smart factories, AR/VR and cloud gaming.
- Other notable applications include connected, autonomous cars, smart cities, and home automation systems.

Conclusion:

Experts believe the true potential of edge computing will become apparent when 5G networks go mainstream in a year from now. Users will be able to enjoy consistent connectivity without even realising it.

Conservation, environmental pollution and degradation, environmental impact assessment

What is Single Use Plastic? Discuss the challenges posed by them and explain in what way one can deal with the plastic menace steadily and replace it? Also suggest way forward. (250 words)

[youtube](#)

Why this question:

The TV debate captures the issues associated with single use plastic and the challenges associated with it.

Key demand of the question:

One must explain in detail the issues associated with single use plastic and the challenges in overcoming the threats posed by it and in managing and eradicating the menace totally.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In brief narrate the recent ban placed on single use plastic in the country.

Body:

Explain the following dimensions:

Provide some statistics/data on single use plastic usage to set the background.

Explain what is single use plastic? – Single-use plastics, also referred as disposable plastics, are commonly used for plastic packaging and intended to be used only once before they are thrown away or recycled. These include grocery (polythene) bags, food packaging, bottles, straws, containers, cups, cutlery etc.

Discuss the challenges involved in detail.

Why we need to ban single-use plastic? Its impact and Government's Initiatives against plastic menace.

Conclusion:

Conclude with way forward.

Introduction:

Single Use plastic is a form of plastic that is disposable, which is only used once and then has to be thrown away or recycled. The single-use plastic items include plastic bags, water bottles, soda bottles, straws, plastic plates, cups, most food packaging and coffee stirrers. The single-use plastic products also prevent the spread of infection. Instruments such as syringes, applicators, drug tests, bandages and wraps are often made to be disposable. Also, single-use plastic products have been enlisted in the fight against food waste, keeping food and water fresher for longer and reducing the potential for contamination

Body:

Govt. of India has laid great emphasis on eradicating single use plastic which has become one of the biggest sources of pollution. During his Independence Day Speech this year Prime Minister had urged the people to take a pledge on Mahatma Gandhi's 150th Anniversary on 2nd October to make the country free of single use plastic

Challenges posed:

- Petroleum-based plastic is not biodegradable and usually goes into a landfill where it is buried or it gets into the water and finds its way into the ocean.
- Plastic in oceans and forests are choking flora and fauna. In fact, plastic trash is expected to exceed the fish population in 2050.
- Microplastics have ability to enter food chain with the highest concentration of the pollutants.
- **The PWM Rules Amendment, 2018**, omitted explicit pricing of plastic bags that had been a feature of the 2016 Rules.
- Waste plastic from packaging of everything from food, cosmetics and groceries to goods delivered by online platforms remains unaddressed.
- The fast moving consumer goods sector that uses large volumes of packaging, posing a higher order challenge.
- Lack of adequate infrastructure for segregation and collection is the key reason for inefficient plastic waste disposal.
- Small producers of plastics are facing the ban, while more organised entities covered by the Extended Producer Responsibility clause continue with business as usual.

- Lack of consultation with stakeholders such as manufacturers of plastics, eateries and citizen groups: This leads to implementation issues and inconvenience to the consumers.
- Exemptions for certain products such as milk pouches and plastic packaging for food items severely weaken the impact of the ban.
- No investment in finding out alternative materials to plug the plastic vacuum: Until people are able to shift to a material which is as light-weight and cheap as plastic, banning plastic will remain a mere customary practice.
- Lack of widespread awareness among citizens about the magnitude of harm caused by single-use plastic: Without citizens 'buying in' to a cause, bans only result in creating unregulated underground markets.
- No strategy to offset the massive economic impact: Sweeping bans like the one in Maharashtra are likely to cause massive loss of jobs and disruption of a large part of the economy dependent on the production and use of plastic.

Measures needed:

- Target the most problematic single-use plastics by conducting a baseline assessment to identify the most problematic single use plastics, as well as the current causes, extent and impacts of their mismanagement.
- Consider the best actions to tackle the problem (e.g. through regulatory, economic, awareness, voluntary actions), given the country's socio-economic standing and considering their appropriateness in addressing the specific problems identified.
- Assess the potential social, economic and environmental impacts (positive and negative) of the preferred short-listed instruments/actions. How will the poor be affected? What impact will the preferred course of action have on different sectors and industries?
- Identify and engage key stakeholder groups – retailers, consumers, industry representatives, local government, manufacturers, civil society, environmental groups, tourism associations – to ensure broad buy-in. Evidence-based studies are also necessary to defeat opposition from the plastics industry.
- Raise public awareness about the harm caused by single-used plastics. Clearly explain the decision and any punitive measures that will follow.

Way forward:

- Promote alternatives like cotton, khadi bags and bio-degradable plastics.
- Provide economic incentives to encourage the uptake of eco-friendly and fit-for-purpose alternatives that do not cause more harm. Support can include tax rebates, research and development funds, technology incubation, public-private partnerships, and support to projects that recycle single-use items and turn waste into a resource that can be used again.
- Reduce or abolish taxes on the import of materials used to make alternatives.
- Provide incentives to industry by introducing tax rebates or other conditions to support its transition. Governments will face resistance from the plastics industry, including importers and distributors of plastic packaging. Give them time to adapt.

- Use revenues collected from taxes or levies on single-use plastics to maximize the public good. Support environmental projects or boost local recycling with the funds. Create jobs in the plastic recycling sector with seed funding.
- Enforce the measure chosen effectively, by making sure that there is clear allocation of roles and responsibilities.
- Monitor and adjust the chosen measure if necessary and update the public on progress.
- **International examples:**
 - The success of imposing a plastic bag fee has also been established in cities like Chicago and Washington, showing that such interventions could be effective in shaping behaviour change.
 - The European Union is mulling new laws to ban some everyday single-use plastic products including straws, cutlery and plates citing plastic litter in oceans as the concern prompting the action.
 - Countries such as the U.S., Canada and the Netherlands have already put in place regulations to stop the use of microbeads in personal-care products. The sooner India adopts such regulations, the better
- **Encouraging logging:** Picking up litter while jogging or strolling was kick-started on a small scale in a small part of Stockholm about an year ago, it has spread across the globe and India can adopt this as well.

The government of India's bid to build a Green wall will be a breakthrough development if fulfilled successfully. Comment.(250 words)

Livemint

Why this question:

The article provides for the detailed presentation of the scheme for Green wall proposed by the government of India on the lines of the Green wall of Sahara in Africa.

Key demand of the question:

One has to explain the relevance of such move to the environmental efforts of the government.

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

In brief explain how the idea is a true inspiration.

Body:

Discuss the grand significance of such a pilot project that is a great step forward in terms of reducing carbon foot print on Earth.

India is reportedly planning to undertake a vast reforestation exercise along the Aravalli hill range that stretches from the Ridge of Delhi to Banaskantha in Gujarat.

Provide for a brief discussion on the African green belt too.

Discuss the aim behind the project and assert upon its significance.

Conclusion:

Conclude that it is a positive step forward to deal with the issue of climate change and global warming.

Introduction:

‘Green wall of India’ is the proposal of a 1 a 1,400km-long and 5km-wide green corridor all the way from Panipat in Haryana to Porbandar in Gujarat. India is reportedly planning to undertake a vast reforestation exercise along the Aravalli hill range that stretches from the Ridge of Delhi to Banaskantha in Gujarat. It should reassure us that ecological concerns haven’t fallen off the map. The Green wall of India would be modelled on the so-called Great Green Wall of Africa that was envisioned to run from Djibouti in the continent’s east to Senegal in its west.

Body:

Need for the initiative:

- Felling of trees is turning greenery scarce, but other forms of depredation too is also hurting.
- Unauthorized mining for minerals and building materials, for instance, has gone on unchecked for much too long.
- Around 96.4 million hectares, or nearly 30% of India’s total land, is estimated to have been degraded already.
- The desertification and land degradation atlas of India, brought out by the ISRO in 2016, revealed that Gujarat, Rajasthan and Delhi were among states/UT where more than 50% of the total area was degraded land and those under the threat of desertification.
- Two-thirds of all Indian households still live off the land and land degradation puts their livelihoods at direct threat.
- Global warming has begun to distort rainfall and other climatic patterns that have sustained our ecological systems for millennia.

SHIELD AGAINST DESERT

➤ Forest belt likely to run roughly from **Porbandar to Panipat**, covering entire Aravali range and beyond

➤ ‘Green wall’ will act as barrier for dust from west and check eastward march of Thar desert

➤ It will check desertification by **restoring degraded land through massive afforestation**

➤ Project yet to get formal nod, details to be worked out

Green wall – a breakthrough initiative:

- It would act as a **defensive flank against climate change, desertification and other forms of land degradation.**

- The Delhi metropolitan region's expansion has resulted in widespread deforestation around the capital.
- The Aravalli range, which separates western India's Thar desert from the relatively green plains to its east, has lost so much green cover that it is losing its ability to act as a natural barrier against the heat and dust that blows in from the west.
- The greener the green wall remains, say ecologists, the less likely that the desert will expand into the rest of the Indian landmass.
- Without top-level intervention in favour of vegetation, environmentalists warn, the Thar desert's expansion could even threaten the "granary of India"—the fertile belts of Punjab, Haryana, western Uttar Pradesh and the Malwa region.
- If this is so, then the proposed project could insure the country against a potential crisis of food insufficiency in the decades ahead.
- The very idea behind it could inspire tree plantation drives elsewhere around the country.

Conclusion:

The green belt may not be contiguous, but would roughly cover the entire degraded Aravali range through a massive afforestation exercise. A legacy programme like converting such a huge tract of land as a green belt in high-intensive land-degraded states will be great boost towards meeting India's target.

Explain the significance of C40 Clean Air Cities Declaration. Why do you think cooperation at global level is necessary? Discuss the challenges and ways to address air pollution across the global cities. (250 words)

Hindustantimes

Why this question:

Clean Air Cities Declaration' was unveiled at the C40 World Mayors Summit in Copenhagen, an event that occurs once every three years and is designed to implement "substantive clean air policies by 2025".

Key demand of the question:

One must explain the significance of C40 Clean Air Cities Declaration and the increasing need to address the issue of air pollution across the world cities.

Directive:

Comment

Structure of the answer:

Introduction:

One can start by quoting relevant statistics/data highlighting the air pollution issue.

Body:

Explain first the key features of the C40 Clean Air Cities Declaration.

Through this Declaration, mayors commit to using their power and influence to reduce air pollution and work towards meeting the World Health Organization's Air Quality Guidelines.

This means cities will continually reduce their local emissions, and advocate for reductions in regional emissions, resulting in continuous declines in air pollution levels that move towards the WHO guidelines.

Discuss why we need a global action to tackle the menace of air pollution?

Suggest solutions.

Conclusion:

Conclude with way forward.

Introduction:

C40 is a network of the world's megacities taking action to address climate change. It is a group of 94 cities around the world that represents one-twelfth of the world's population and one-quarter of the global economy. The summit was launched in London in 2005 when the then London Mayor convened representatives from 18 megacities.

Body:**Significance of C40 Clean Air cities declaration:**

- The aim of the summit is also to show how cities are delivering their strong commitments for healthier, sustainable, resilient and inclusive future.
- C40 supports cities to collaborate effectively, share knowledge and drive meaningful, measurable and sustainable action on climate change.
- It has been created and led by cities and is focused on tackling climate change and driving urban action that reduces greenhouse gas emissions and climate risks while increasing the health, wellbeing and economic opportunities of urban citizens.
- Signatories set ambitious pollution reduction targets within two years that meet or exceed national commitments, putting them on a path towards meeting World Health Organization guidelines;
- Implement substantive clean air policies by 2025 that address the unique causes of pollution in their cities
- They publicly report progress on achieving these goals.

Need for global level cooperation:

- It helps to take bold action to address the issues of climate change and air pollution.
- Nowadays, air pollution is an international problem with several impacts on living organisms

Challenges posed by air pollution:

- The role of air pollution in climate change dynamics is a question that must be urgently addressed.
- For example, the importance of air pollution and greenhouse warming vs. aerosol cooling needs to be discussed with air pollution cooling, dominated by aerosol content
- Many open questions still remain, such as the measurement and monitoring of air pollution, including the exploration of new technologies and methods like remote sensing and in-situ observations.
- Air pollution also impacts historic and modern buildings and materials, affecting sites of cultural heritage by damaging structural materials of monuments, statues, and even paintings.
- Air pollution has become a year-round phenomenon particularly in north India which causes health impacts far beyond the seasonal rise of respiratory illnesses.
- It is now the leading risk factor for chronic obstructive lung disease in India, and a major contributor to pneumonia and lung cancer.

- In 2017, air pollution accounted for 12.4 lakh deaths in India, which included 6.7 lakh deaths due to outdoor particulate matter air pollution and 4.8 lakh deaths due to household air pollution.
- According to a report by the **United Nations Environment Programme (UNEP)**, India had the highest share of welfare costs (or a loss of income from labour), of about \$220 billion (about ₹1.4 trillion), in South and South-East Asia of a combined total of \$380 billion from mortality due to air pollution.
- In addition to human lives lost, there's an estimated global cost of \$225 billion in lost labour, and trillions in medical costs, Greenpeace report says.
- Government is keen to ascend the World Bank's "ease of doing business" chart, but images of people walking around Delhi in safety masks do little to attract investment.

Measures needed:

- Short term measures should be accompanied by measures that **increase the forest cover** of the land and provide farmers with an alternative to burning the remains of their crops.
- An innovative approach could be to **use climate change funds to turn farm residues into a resource**, using technological options such as converting them into **biofuels** and **biofertilizers**.
- **Proactive engagements are necessary to persuade and reassure farmers.**
- It is important to find other uses for stubble such as biomass, which may encourage farmers to look for **alternative sources of income**.
- India should at least now give high importance to the **WHO warning about air pollution being the new tobacco**. Sharply escalated, deterrent parking fees can be implemented.
- From an urban development perspective, large cities should reorient their investments to **prioritise public transport, favouring electric mobility**.
- **Incentives** for adoption of **alternate mobility technologies** should be promoted.
- The **World Bank** has said it is keen to enhance its lending portfolio to tackle air pollution, opening a new avenue for this.
- Governments should make the **use of personal vehicles in cities less attractive** through **strict road pricing mechanisms** like **Congestion tax, Green-house Gas tax**
- Need to speed up the journey towards **LPG and solar-powered stoves**.
- **Addressing vehicular emissions** is within India's grasp but requires a multi-pronged approach. It needs to combine the already-proposed tighter emission norms (in form of BS VI), with a push for shared mobility and public transport and adoption of alternate mobility technologies.
- NCAP should take precedence from emerging practices in the country—**pollution cess in Delhi on truck entry, big diesel cars, and diesel fuel sales and the coal cess**—to generate dedicated funds to finance clean air action plan.

- **Tackle road dust by mechanised sweeping and water-sprinkling** but what would be more beneficial is if the sides of the roads could be paved or covered with grass that holds the soil together and stops the production of the dust in the first place.
- Attention to non-technological aspects such as **urban planning, to reduce driving, and to increase cycling, walking, and use of public transport are needed.**

Climate change mitigation should be integral to the urban planning, in this regard, discuss the strategies to be developed to have a sustainable urbanisation and discuss any measures taken by the government to that effect. (250 words)

The hindu

Why this question:

The article highlights the significance of keeping urban planning centric to the climate change.

Key demand of the question:

Explain the significance of considering the climate change factor integral to the urban planning aspect.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief discuss the centrality of climate change aspect to urban planning.

Body:

Explain, in brief, cities contribution to the emissions and need for integrating the climate change in planning of cities.

Suggest on various strategies to have sustainable urbanization transportation, land resource management, green vehicles, green buildings etc.

Elaborate on the measures taken by the government to ensure sustainable cities.

Conclusion:

Conclude with way forward.

Introduction:

Climate change impacts such as increased rainfall intensity, storm surges, and flooding and urban heat island effects are likely to affect many urban systems worldwide. These will impact severely on urban systems and the populations and services they support. For the second time this year, Bihar is submerged. In July, 13 districts in north Bihar were inundated, and now, it's the turn of four other districts, including the capital, Patna.

Body:

Climate change presents a significant challenge for urban systems worldwide. Its effects will likely intensify over the coming decades. Whilst humanity may be able to take collective action to limit the intensity of these effects, scientific evidence indicates that some are already happening and will continue to occur, irrespective of any ongoing mitigation.

Some global good practices:

- In Copenhagen, mayors from Toronto and Berlin spoke about expensive plans to retrofit buildings for energy efficiency and shift their transport infrastructure to greener options.

- Montreal is shifting city logistics to electric vehicles, keeping large trucks confined to centralised terminals.
- The city of Rome has an aggressive plan to ban diesel emissions, encourage sustainable shared mobility including biking and walking, and pursue a green new deal.
- China's Hangzhou already has the largest public bicycle-sharing system and is moving to a smart bus service.
- Hong Kong is ready to harvest super typhoons in new drainage tunnels that will reuse rainwater and grow biodiversity.
- Singapore will put a price on carbon.
- Novo Nordisk, a healthcare company, wants to partner with mayors on its Cities Changing Diabetes programme to "bend the curve" on the public health challenge through better facilities for biking, walking and urban mobility.

Measures taken by the government:

- **National Action Plan on Climate Change (NAPCC).**
- **National Adaptation Fund on Climate Change (NAFCC).**
- **Climate Change Action Programme (CCAP)**
- **International Solar Alliances (ISA)**
- The ambitious goal of generating 175 GW of renewable energy by 2022.
- Atal Mission for Rejuvenation & Urban Transformation (AMRUT), Smart cities.
- FAME Scheme – for E-mobility
- Energy efficiency initiatives
- Leapfrogging from Bharat Stage -IV to Bharat Stage-VI emission norms by April 2020
- India's forest and tree cover has increased by 1 percent as compared to assessment of 2015.
- Schemes like **UJALA** for LED distribution has crossed the number of 320 million while **UJJWALA** for distributing clean cooking stoves to women below poverty line has covered more than 63 million households.
- **State Action Plan on Climate Change (SAPCC)**
- At the C40 summit, Kolkata bagged an award for green mobility.
- Delhi's Chief Minister informed the delegates that the national capital was cutting emissions by inducting 1,000 electric buses, planting trees on a massive scale, and eliminating the use of dangerous industrial chemicals.
- Delhi is also setting up a task force for clean air. These must be the priorities for all cities.

Way Forward

- Investment in R&D is needed to spur innovations in sustainable climate-friendly and climate-proof productivity, and the private sector can help on this.

- Creation of urban policies which focus on both green cover as well as development of urban areas.
- Micro-forests, urban forests, vertical gardens, roof-top gardens and preservation of green spaces in the urban spaces must be taken up at rapid pace.
- All Indian states must conduct a detailed survey of their water bodies, which can serve as an insurance against floods.
- Strict laws against encroachment of the wetlands in the urban areas must be implemented.
- Involvement of the people in decision making on important issues like infrastructure development leads to unbiased and sustainable decision making.
- A high-density, poly-nodal, public-transport oriented urban pattern that would reduce travel distances and encourage non-motorised travel must find favour with India's city planners.
- Specific environmental targets must be built into the urban planning process.
- the new Energy Conservation Building Code should be made mandatory.
- Promoting a green growth model and pushing for radical reforms in urban planning should be the norm.

Conclusion:

It is vital that urban and climate change policies synergise at the local body level and a sustainable growth pattern is adopted on priority. Simultaneously, the resilience of cities, particularly of their poor areas, has to be vastly improved so that they can better manage the impact of climate change.

“The first step towards tackling climate change is to accept the science and create conditions for innovative solutions”. Comment. (250 words)

Livemint

Why this question:

The article explains in what way the projections of future climate are based on scenarios of socio-economic changes.

Key demand of the question:

One has to elucidate upon the fact that the first step towards tackling climate change is to accept the science and create conditions for innovative solutions.

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

In brief highlight the alarming concerns posed by climate change.

Body:

First discuss the significance of science to handle the ill effects of climate change.

Take hints from the article and explain in what way tackling climate change is to accept the science and create conditions for innovative solutions to be found.

Explain what effect the climate change is having upon the children of future generations who are unknowingly compelled to involve in tackling and dealing with climate change.

Conclusion:

Conclude with way forward.

**Introduction:**

Climate change is a complex problem. It is inextricably linked with society, economics, politics, and people's way of life. More than 190 countries signed the Paris Agreement in 2016, committing to change how they create and use energy in order to lower impacts of carbon and other greenhouse gases on the planet. All over the world, people and organizations are taking action to both lower carbon footprints and find innovative ways to adapt to the effects of climate change.

Body:**Climate change is an immediate issue to be tackled:**

- Global warming above pre-industrial levels has touched about 1 degree Celsius.
- The IPCC 1.5 report basically says, at the current rates at which we are producing greenhouse gases, we are looking at a couple of decades really before what we have available is exhausted.
- At one level, for many people climate change has become an existential problem, a problem that risks undermining the conditions for productive life and therefore a problem that does not override but certainly permeates all kinds of other issues.
- For many others, climate change is a distant problem that is overwhelmed by more immediate issues.
- The rapid change of climate change is likely to exceed the ability of many species to migrate or adjust. Experts predict that one-fourth of Earth's species will be headed for extinction by 2050 if the warming trend continues at its current rate.
- Sea levels have risen between four and eight inches in the past 100 years. Current projections suggest that sea levels could continue to rise between 4 inches and 36 inches over the next 100 years.
- As temperatures rise globally, droughts will become more frequent and more severe, with potentially devastating consequences for agriculture, water supply and human health. This phenomenon has already been observed in some parts of Asia and Africa, where droughts have become longer and more intense.
- Hot temperatures and dry conditions also increase the likelihood of forest fires.

Challenges in addressing climate change:

- **Regional Inequality:**
 - The principle of Common but differentiated responsibilities was proposed to tackle climate change by addressing the regional inequality.
 - However, the indifferent behaviour by the developed countries has led to partial success of many global initiatives. E.g. Kyoto Protocol.
- **Developed Countries not taking responsibility:**
 - Historical emissions and pollution caused due to industrial revolution is not accepted by the industrialized nations.

- Developed nations are unwilling to accept the responsibility and are moving away from global agreements. E.g. USA rejecting the Paris deal.
- **Finance:**
 - Huge amount of funds is required for adaptation and mitigation measures to be adopted.
 - For e.g.: electric mobility, certainly is a green measure, but is actually expensive, in immediate terms, in terms of cost per vehicle kilometre.
 - The cost of shifting into renewable energy is also a fiscal challenge to most countries.
- **Technology:**
 - Many adaptation and mitigation measures need sophisticated technologies and Research and Development which is an impediment to many developing and small island nations.
 - Commercialization of technology in form of Patents, evergreening has made it unaffordable.
- **Increasing use of fossil fuels.**
- **Complex linkages among emissions, concentrations, climate changes, and impacts.**
- **Lack of certainty about the details of future climate change.**
- **Significant time lags in human response systems.**
- **Risks, judgments about risk, and adaptation needs are highly variable across different contexts.**

Way Forward

- The first step in tackling climate change is to accept the science and create conditions for innovative solutions to be found.
- Investment in R&D is needed to spur innovations in sustainable climate-friendly and climate-proof productivity, and the private sector can help on this.
- There should instead be major changes in technological innovation, behaviour, values and governance. This is an unprecedented challenge for humanity.
- Incremental changes along with increasing contributions from renewables and improvements in energy efficiencies would not be sufficient.
- This is the time for the world's leaders to demonstrate that they are ready to go beyond expediency and take the actions needed to avert long-term catastrophe.
- Wealthy nations like the U.S., and those of the EU argued that emissions from developing countries are consistently rising and they need to commit to more serious emission cuts. A consensus needs to be developed at the earliest.
- The immediate up scaling of ambition in the second Commitment period of Kyoto Protocol and its early ratification by all Kyoto Protocol parties would be a step in the right direction.

- Concerning mitigation, distinction enshrined in the Convention between Annex I (Developed) and non-Annex I (developing) Parties must be maintained in accordance with the principles of Equity, CBDR and other provisions of the UN Conventions.
- The 'developing versus developed country' schism needs to be diluted at the earliest and Developed Countries should avoid watering down the CBDR principle envisaged in earlier agreements.

What are green crackers? Are green crackers less polluting and to what extent there is awareness among people about it? Explain. (250 words)

The hindu

Why this question:

Last October, in a landmark judgment, the Supreme Court of India mandated the use of green crackers for Deepavali, prescribing specific norms for the manufacture. This year, for the first time, 'green crackers' have been made available in markets, though the reach has been limited. These are milder avatars of traditional firecrackers in terms of the sound and smoke generated when burnt. Thus making it important for us to have an understanding of what are Green Crackers.

Key demand of the question:

Explain in detail what Green Crackers are and explain their significant contributions to environment in controlling pollution.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In brief define green crackers and highlight the SC judgments in this regard.

Body:

In brief, show the impact of burning crackers on the environment.

Define green crackers and discuss various aspects of green crackers.

Add a note, in brief, on their supplies as of now.

Comment in detail whether green crackers are less polluting or not?

Assess the extent to which there is awareness about the green crackers.

Conclusion:

Conclude with way forward.

Introduction:

Green crackers are low-polluting firecracker within the permitted decibel and emission norms is a green cracker. They are the crackers with reduced emission and decibel level. They are known as 'green' firecrackers because they have a chemical formulation that produces water molecules, which substantially reduces emission levels and absorbs dust. In 2018, while restricting the use of fireworks during all events to an 8-10 pm window, the Supreme Court ordered that only crackers with reduced emission and "green crackers" can be manufactured and sold.

Body:

In its report the CPCB said that due to fireworks on Diwali day, particulate matter 2.5 (tiny particles or droplets in the air that are two and one half microns or less in width, and hinder visibility and adversely affect health) levels go up. It stated when there was less fireworks in 2017, the level had reduced compared to previous years.

The crackers have been named as **Safe Water Releaser (SWAS)**, **Safe Thermite Cracker (STAR)** and **Safe Minimal Aluminium (SAFAL)**. These crackers are available as sparklers, flowerpots, maroons and atom bombs and have been developed by the **National Environmental and Engineering Research Institute (NEERI)**, a **Council of Scientific and Industrial Research (CSIR)** lab.

Pollution levels of Green Crackers:

- **SWAS (Safe Water Releaser)**
 - SWAS crackers eliminates usage of (KNO₃) Potassium nitrate and Sulphur with consequent reduction in particulate matter (30-35%) SO₂ and NO_x.
 - It has matching sound intensity with commercial crackers in the range of 105-110 dB
 - STAR eliminates usage of KNO₃ and S with consequent reduction in particulate matter (35-40%), SO₂ and NO_x. It has matching sound intensity with commercial crackers in the range of 105-110 dB
 - SWAS has been tested for shelf life upto 3 weeks with consistent performance.
- **SAFAL (Safe Minimal Aluminium)**
 - SAFAL has minimal usage of aluminium (only in flash powder for initiation) with consequent significant reduction in particulate matter (35-40 %) compared to commercial crackers.
 - It has matching sound intensity with commercial crackers in the range of 110-115 dB
 - PESO has been approached to analyse and test SWAS/STAR/SAFAL from point of view of safety, stability and other related issues.
 - Also functional prototypes of flower pots for substitution of BaNO₃ (Barium nitrate) by low cost eco-friendly materials have been developed with significant reduction in particulate matter (30-35%).
- **STAR (Safe Thermite Cracker)**
 - STAR has the capability to eliminate the usage of KNO₃ and S with a consequent reduction in particulate matter (35-40 per cent), SO₂ and NO_x.
- Components in firecrackers are replaced with others that are **less dangerous and less harmful to the atmosphere**.
- Broadly, it avoids the use of ash or filler materials and use charcoal as per specifications by **Petroleum and Explosives Safety Organisation (PESO)**.
- The green crackers will be 25-30 per cent cheaper to manufacture and manufacturers would not have to make any changes in their facilities.
- In green crackers the commonly used polluting chemicals like aluminium, barium, potassium nitrate and carbon have either been removed or sharply reduced to slow down the emissions by 15 to 30%.

WHAT ARE 'GREEN CRACKERS'?

Firecrackers that have "less dangerous" and "less harmful" chemicals than conventional ones

Being Developed by
CSIR's National Environmental Engineering Research Institute

Production after they are approved by Petroleum and Explosives Safety Organisation (PESO)

Green Because

- ▶ They have a chemical formulation that produces water molecules
- ▶ This substantially reduces emission level and absorbs dust
- ▶ Is basically a light and sound show that produces lower emissions
- ▶ Promise **30-35% reduction** in particulate matter, nitrous oxide and sulphur oxide

Also In The Works
E-CRACKERS BEING DEVELOPED BY CSIR'S CENTRAL ELECTRONICS ENGINEERING RESEARCH INSTITUTE

Expected to hit the market in 4-5 years*

OTHER INITIATIVES

- Crackers with lower aluminium to reduce emissions substantially
- 'Anar' or flower pot made using eco-friendly material that can reduce particulate matter by 40%
- Bijli crackers that eliminate use of ash as desiccants
- Firecrackers without antimony, lithium, mercury, arsenic and lead as directed by PESO last year

Council of Scientific and Industrial Research

Conclusion:

CSIR-CEERI, being an electronics laboratory, is developing safe and pollution free technology of electronic crackers (E-crackers) to meet latent social aspiration of enjoying fireworks.

What do you understand by 'carbon mineralisation'? How does it help in the fight against climate change? Which are other significant carbon capture and storage methods? Discuss the prospects of CCS. (250 words)

[The hindubusinessline](https://www.thehindubusinessline.com)

Why this question:

The question is amidst the recent coming of newer methods of carbon capture and storage.

Key demand of the question:

One has to elaborate what is carbon mineralisation, Elaborate how it helps in the fight against the climate change. Write other significant carbon capture and storage methods available.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Write in brief about the 'Carbon mineralization'.

Body:

Mineralisation' is the decomposition of the chemical compounds in organic matter, by which the nutrients in those compounds are released in soluble inorganic forms that may be available to plants. Carbon sequestration is the process of capture and long-term storage of atmospheric carbon dioxide to mitigate global warming and to avoid dangerous impacts of climate change. The Carbon Capture And Storage (CCS) chain consists of three parts; capturing the carbon dioxide, transporting the carbon dioxide, and securely storing the carbon dioxide emissions, underground in depleted oil and gas fields or deep saline aquifer formations.

Explain significant carbon capture and storage methods.

Conclusion:

Conclude with way ahead.

Introduction:

Carbon mineralization is the process of conversion of carbonaceous material to carbon dioxide. It is the most general function of soil microbial communities that can be affected by exposure to pollutants. The mineralisation of carbon compounds is the fundamental energy-producing process for heterotrophic organisms. The process may result in production of CO₂ or CH₄ (depending on oxygen availability) in secondary production, which is subsequently mineralised, and in residual compounds, which tend to be increasingly resistant to decomposition.

Body:

It is a kind of Carbon capture and storage (CCS) technology which removes carbon dioxide from flue gases for storage in geologic formations or the ocean.

This iterative cascade provides some opportunities for directly manipulating the rate of carbon mineralisation by (i) maintenance of the food web; (ii) selective control of specific functional groups; and (iii) relocation of the organic resources.

Carbon mineralization and fight against climate change:

- Increasing soil carbon offers a range of co-benefits and this would buy us time before other technologies can help us transition to a zero-carbon lifestyle.
- Significant carbon pools on earth are found in the earth's crust, oceans, atmosphere and land-based ecosystems. Soils contain roughly 2,344 Gt (1 gigatonne = 1 billion tonnes) of organic carbon, making this the largest terrestrial pool.
- Increasing Soil Organic Carbon (SOC) through various methods can improve soil health, agricultural yield, food security, water quality, and reduce the need for chemicals.
- Changing agricultural practices to make them more sustainable would not just address carbon mitigation but also improve other planetary boundaries in peril such as fresh water, biodiversity, land use and nitrogen use.

Other CCS methods:

- Researchers have developed a new technology to capture carbon dioxide from a stream of air — virtually at any concentration level — an advance that may pave the way for new strategies to reduce atmospheric greenhouse gas levels.

- **Pre-combustion:** This method is normally applied to coal-gasification combined-cycle power plants. The coal is gasified to produce a synthetic gas made from carbon monoxide and hydrogen. The former is reacted with water to produce CO₂, which is captured, and more hydrogen. The hydrogen can be diverted to a turbine where it can be burned to produce electricity. Alternatively, some of this gas can be bled off to feed hydrogen fuel cells for cars.
- **Post-combustion:** In this method, CO₂ is separated from the flue gas of the power station by bubbling the gas through an absorber column packed with liquid solvents (such as ammonia). In the most widely used system, once the chemicals in the absorber column become saturated, a stream of superheated steam at around 120°C is passed through it. This releases the trapped CO₂, which can then be transported for storage elsewhere.
- **Oxyfuel:** When coal, oil or natural gas is burned in normal air, CO₂ makes up around 3-15% of the waste gas – and separating it out is difficult and energy-intensive. An alternative method is to burn the fuel in pure oxygen. In this environment, virtually all the waste gas will be composed of CO₂ and water vapour. The latter can be condensed out while the former can be piped or transported directly to a storage facility.
- **Green Cover:** Afforestation / Reforestation / Plantation / Agro forestry: Trees are natural sequesters of carbon, they take carbon from atmosphere, utilize it in the process of photosynthesis as well as they store it in the form of biomass or wood.
- **Wetland restoration:** Wetland soil is an important natural carbon pool or sink. Wetlands conserve 14.5 % of the soil carbon found in world. But only 6 % of the world's land is composed of wetland
- **Oceans:** Oceans absorb CO₂ from the atmosphere because the concentration of CO₂ in the atmosphere is greater than that in the oceans. This difference in partial pressure of CO₂ results in the gas being absorbed into the world's oceans.
- **Subterranean injection or Geological sequestration:** Carbon dioxide can be injected into depleted oil and gas reservoirs and other geological features, or can be injected into the deep ocean, this is known as subterranean injection.

Prospects for CCS:

- Momentum for climate action has surged since the Paris Agreement in December, with increased investment in clean, renewable energy and new energy technologies.
- CCS technologies aims to keep climate-warming carbon dioxide out of the atmosphere, acting as a bridge to a lower-carbon future.
- To reach that future, national commitments to reduce emissions and increase public and private funding for research and development could help move CCS forward.
- Along with global deployment of renewable energy, CCS has the potential to cut emissions from fossil-fuelled power sources and energy-intensive industry.
- In addition, the Paris conference saw the launch of a CCS development and deployment roadmap for China, a paper outlining the role of CCS in the climate change mitigation portfolio of a coalition of environmental organizations, and a report that highlights CCS in its call for increased climate action over the next five years.

- Increasing support for carbon pricing from private companies, national governments and international organizations could also support the fledgling CCS industry by using funds collected from putting a price on emissions to help pay for carbon capture and storage, and ultimately making carbon expensive enough to incentivize wider CCS use.
- Another encouraging sign for CCS is the commitment by 20 countries, known as **Mission Innovation**, to double public funding for clean energy research and development over the next five years.

India intends to move away entirely from single-use plastics by 2022, yet the fact is India hasn't had much success with plastic waste regulation despite ambitious policy moves. Discuss in detail the underlying causes of such a situation and suggest solutions. (250 words)

Financialexpress

Why this question:

The article captures a detailed discussion on What does India's plastic regulation provide for, and where does it fall short.

Key demand of the question:

One must debate upon the plastic regulation scenario of the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief state some key facts to set the context of the question.

Body:

The answer must detail upon what ails India when it comes to meaningful action on reducing plastic waste.

Explain what does India's plastic regulation provide for, and where does it fall short?

Discuss that India has tried to regulate plastic pollution for at least two decades now. And yet nearly every stakeholder seems ill-prepared. Is regulation the problem, or is it industry and consumers who have simply failed to respond?

Suggest solutions specific to the problems.

Conclusion:

Conclude with way forward.

Introduction:

Govt. of India has laid great emphasis on eradicating single use plastic which has become one of the biggest sources of pollution. During his Independence Day Speech this year Prime Minister Narendra Modi had urged the people to take a pledge on Mahatma Gandhi's 150th Anniversary on 2nd October to make the country free of single use plastic.

Body:

Single Use plastic is a form of plastic that is disposable, which is only used once and then has to be thrown away or recycled. The single-use plastic items include plastic bags, water bottles, soda bottles, straws, plastic plates, cups, most food packaging and coffee stirrers. The single-use plastic products also prevent the spread of infection. Instruments such as syringes, applicators, drug tests, bandages and wraps are often made to be disposable. Also, single-use plastic products have been enlisted in the fight against food waste, keeping food and water fresher for longer and reducing the potential for contamination

**India's policies to curb single-use plastic:**

- The Plastic Waste Management (PWM) Rules, 2016, with specific obligations for every stakeholder in the plastic supply-chain, including the extended producer responsibility (EPR) for producers, importers, brand owners.
- The Solid Waste Management Rules (SWM Rules), 2016, also have provisions for plastic waste, including EPR.
- The Biomedical Waste Management Rules, 2016, mandated phase-out of chlorinated plastic bags, gloves and blood bags within two years.
- Then there are state regulations banning single-use plastics (SUP).
- **Odisha** has defined SUP as polythene carry-bags, bottled water of less than 200ml, disposable cutlery made of thermocol and plastics and decorative materials (flower and the likes) made of thermocol.
- **UP** has excluded 200ml plastic water bottles and decorative materials, and included disposable tumblers, in the definition of SUP.
- **Tamil Nadu** has defined SUP as “use and throw plastics,” which include plastic carry-bags, flags, plastic sheets used for food wrapping and spreading on the dining table, plastic plates, plastic-coated cups, tumblers, water pouches and packets.

Shortcomings in the above regulations:

- The problem is with regulations, and with consumer awareness and industry's status-quo approach.
- There is a difference in EPR provisions under SWM Rules and PWM Rules.
- SWM Rules say that manufacturers/brand-owners shall provide financial assistance to local authorities for establishing waste management systems to fulfil their EPR.
- PWM Rules, however, don't mention the financial contribution to local authorities.
- Instead, these direct manufacturers/brand-owners to collect waste through their distribution channel or the local body concerned.
- **Implementation** of the Biomedical Waste Management Rules is still lax.
- States have **different definitions** of what constitutes SUP.
- **Consumer apathy** is at the core of the problem. We all talk about plastic pollution, but end up using polythene bags. We crib about dumpsites, but litter ourselves, and waste segregation is still to take off meaningfully.
- **No company in India** has shown leadership in dealing with plastic pollution.
- our approach to rule-making is command-and-control or ruling with a stick, to be precise. The experience of the past 20 years should have made it clear that regulations and penalties are not sufficient to eliminate the use of SUP.

Solutions needed:

- Proper plastic waste management will only happen if there is good municipal waste management. EPR provisions will have to be designed for this reality.
- we must be more focused on **recycling** than bans, given almost 40% of the plastic waste generated in the country remains uncollected
- To increase recycling, we must **improve segregation of waste at source and improve the collection and transportation of segregated wastes.**
- Multi-Layered Plastics contain several polymers, they can't be recycled. At best, they can be incinerated in cement plants, used as a refuse-derived fuel (RFD), used in road construction or for making down-cycled products.
- plastic waste management can't be treated as separate from solid waste management.
- Along with banning thin plastic carry-bags, the government should also promote options like textile or paper bags.
- A combination of economic and regulatory tools is required to incentivise quick entry of alternatives in a viable manner.

Global practices to tackle single-use plastic:

- Globally, plastic waste regulation is about **better segregation, collection, and then disposal.**
- The focus is not so much on the end-of-the-life reuse/recycling. This is the reason why, globally, **more than 90% of the plastics are not recycled.**
- Sweden, which is considered to have one of the best plastic waste management systems. Its plastic recycling rate is meagre, as it burns most of its plastic waste to generate electricity.
- Other developed countries, like the US, have outsourced plastic pollution. They consume a lot and then ship the waste to developing countries like China, India and now Africa.

Way forward:

- Design for recycling. Instead of using multiple polymers in packaging like multilayered plastics, they should be shifting to single polymers that will aide recycling. This can be done quickly.
- Reduce the weight of packaging and the need for packaging. There is a vast scope to reduce plastic consumption here. This is again a short- to medium-term goal.
- Start developing, substituting plastic with alternatives. This is something that they need to start working immediately, but this is a medium- to long-term goal.
- Start working closely with the local authorities to ensure littering is minimised and the collection of segregated plastics is maximised. This will reduce visible pollution, enhance recycling and end-of-life use.
- The plastic life cycle eventually is "from oil to oil" or "from oil to ash (incineration)." So, we will have to develop state-of-the-art facilities for energy recovery and conversion.

Disaster and disaster management.

Extreme weather like long dry spells, accompanied with more intense rainfall concentrated over fewer days, are becoming the norm. In this context critically evaluate how Climate change and poor urban planning are jeopardizing lives of people. (250 words)

Hindustantimes

Why this question:

The article discusses how extreme rainfall events are on the rise in the country. Long dry spells, accompanied with more intense rainfall concentrated over fewer days, are becoming the norm.

Key demand of the question:

One has to explain the causative factors and the relationship between Climate change and poor urban planning and how it can be addressed.

Directive:

Critically evaluate – When asked to evaluate, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgment.

Structure of the answer:

Introduction:

In brief discuss the recent extreme weather events in short.

Body:

Explain in detail the causative factors of these extreme weather events.

Discuss with suitable case studies – floods, dry spells etc.

Explain that the floods, especially in urban India, are taking place not just due to climate change, but also inadequate urban planning, which has not paid attention to natural water bodies and has forgotten the “art of drainage”.

Expand on the linkages between urban planning and its correlation with extreme events of weather.

Conclusion:

Conclude with way forward.

Introduction:

Climate change impacts such as increased rainfall intensity, storm surges, and flooding and urban heat island effects are likely to affect many urban systems worldwide. These will impact severely on urban systems and the populations and services they support. For the second time this year, Bihar is submerged. In July, 13 districts in north Bihar were inundated, and now, it’s the turn of four other districts, including the capital, Patna.

Body:

Climate change presents a significant challenge for urban systems worldwide. Its effects will likely intensify over the coming decades. Whilst humanity may be able to take collective action to limit the intensity of these effects, scientific evidence indicates that some are already happening and will continue to occur, irrespective of any ongoing mitigation.

Climate change and poor urban planning effects:

- Urban sprawl, combined with unsustainable transportation planning and energy guzzling building practices, has been the main source for the GHG emission.
- This has aggravated climate effects like **urban floods, urban heat islands, reduced ground water table levels etc.**

- The floods, especially in urban India, are taking place not just due to climate change, but also inadequate urban planning, which has not paid attention to natural water bodies and has forgotten the “art of drainage”.
- Urban water bodies, such as wetlands, provide crucial services like groundwater recharge (which is helpful during water-scarce summers, the other face of climate change) and flood management.
- Unfortunately, in India, water bodies are rarely recorded under municipal laws.
- Planners see only land, not water, and the builder lobby just encroaches on them.
- A study by the non-profit, Centre for Science and Environment, shows that Chennai, which faced devastating floods in 2015, had 600 water bodies in the 1980s; a master plan published in 2008 said only a fraction of the lakes in the city were in healthy condition.
- The rapid unplanned urbanization has led to chopping down of urban forest areas inducing climate imbalance and effects of local climate regulation.
- Concretized buildings and pavements, high usage of glass in the buildings has led to compounding of heat leading to urban heat islands.
- Poor urban plans result in rising slums in the cities where basic amenities are lacking and are the first to be affected in case of urban floods and famine.
- All these have lead to loss of lives in the urban cities in large scale, economic losses as well.

Challenges in addressing climate change:

- **Regional Inequality:**
 - The principle of Common but differentiated responsibilities was proposed to tackle climate change by addressing the regional inequality.
 - However, the indifferent behaviour by the developed countries has led to partial success of many global initiatives. Eg. Kyoto Protocol.
- **Developed Countries not taking responsibility:**
 - Historical emissions and pollution caused due to industrial revolution is not accepted by the industrialized nations.
 - Developed nations are unwilling to accept the responsibility and are moving away from global agreements. Eg. USA rejecting the Paris deal.
- **Finance:**
 - Huge amount of funds are required for adaptation and mitigation measures to be adopted.
 - For eg: electric mobility, certainly is a green measure, but is actually expensive, in immediate terms, in terms of cost per vehicle kilometre.
 - The cost of shifting into renewable energy is also a fiscal challenge to most countries.
- **Technology:**

- Many adaptation and mitigation measures need sophisticated technologies and Research and Development which is an impediment to many developing and small island nations.
- Commercialization of technology in form of Patents, evergreening has made it unaffordable.
- **Increasing use of fossil fuels.**
- **Complex linkages among emissions, concentrations, climate changes, and impacts.**
- **Lack of certainty about the details of future climate change.**
- **Significant time lags in human response systems.**
- **Risks, judgments about risk, and adaptation needs are highly variable across different contexts.**

Way Forward

- Investment in R&D is needed to spur innovations in sustainable climate-friendly and climate-proof productivity, and the private sector can help on this.
- Creation of urban policies which focus on both green cover as well as development of urban areas.
- Micro-forests, urban forests, vertical gardens, roof-top gardens and preservation of green spaces in the urban spaces must be taken up at rapid pace.
- All Indian states must conduct a detailed survey of their water bodies, which can serve as an insurance against floods.
- Strict laws against encroachment of the wetlands in the urban areas must be implemented.
- Involvement of the people in decision making on important issues like infrastructure development leads to unbiased and sustainable decision making.
- A high-density, poly-nodal, public-transport oriented urban pattern that would reduce travel distances and encourage non-motorised travel must find favour with India's city planners.
- Specific environmental targets must be built into the urban planning process.
- the new Energy Conservation Building Code should be made mandatory.
- Promoting a green growth model and pushing for radical reforms in urban planning should be the norm.

Conclusion:

It is vital that urban and climate change policies synergise at the local body level and a sustainable growth pattern is adopted on priority. Simultaneously, the resilience of cities, particularly of their poor areas, has to be vastly improved so that they can better manage the impact of climate change.

States of Bihar and Uttar Pradesh face floods frequently because of various natural and manmade reasons. Analyse floods with Patna as a case study in mind. (250 words)

The hindu

Why this question:

Nearly 110 people died in rain-related incidents across the country in the past four days, with Uttar Pradesh reporting the maximum deaths, while

Incessant rainfall in Bihar has badly hit normal life, with almost all areas of capital city Patna under knee-deep waters and people struggling to meet their daily needs.

demand of the question:

One has to explain the causative factors of the flood situation in the states of Bihar and UP.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Narrate the ongoing situation in these states.

Body:

In brief discuss the flood situation in Bihar and UP.

Explain the causative factors of the floods – discuss both manmade and natural causes of it.

Discuss using the case study of Patna; describe specific issues that have left the situation grim.

Conclusion:

Conclude with solutions to address the situation both short term and long term.

Introduction:

Several parts of Bihar and Uttar Pradesh were reeling from floods on Monday following continuing showers over the past few days. Incessant precipitation has deluged many districts, causing havoc, snapping communication lines and claiming several lives.

Body:

The water footprint is a measure of humanity's appropriation of fresh water in volumes of water consumed and/or polluted. It helps us understand for what purposes our limited freshwater resources are being consumed and polluted.

Factors causing floods:

Natural factors:

- **More than average rainfall:**
 - India's northern states have received above-average rainfall on account of sustained low-pressure conditions.

Anthropogenic factors:

- **Uncontrolled urbanization:**
 - Unregulated construction in Patna has been blamed for the situation the city has found itself in over the last few days.
 - The linear development which has been along major road networks, has completely ignored the varying and ecologically sensitive landscape.

- Substantial portions of revenue lands in the State are wetlands and forests, which has resulted in a shortage of buildable land parcels.
- This in turn is creating huge pressure on these ecologically fragile areas for conversion to government-supported infrastructure projects as well as private profit-making enterprises.
- **Poor planning:**
 - The State Action Plans on Climate Change elucidate measures for disaster-risk reduction in the wake of an increasing frequency of heavy rainfall in turn leading to more flooding and landslides.
 - Though plans and laws such as Integrated Water Resources Management or Coastal Regulation Zone Notification hold key solutions to natural disasters that are linked to water management, most of them are not implemented or followed to the letter.
 - A lack of holistic and coordinated measures within planning departments has resulted in further problems
 - **Roads, railway lines and housing colonies** being laid and built without regard for natural water ways, but with formal planning permission.
- **Dilution of laws:**
 - The need of the hour is for a review and revision of building bye-laws for urban and rural areas in accordance with bettering environmental sustainability.
- **Land use:**
 - Injudicious use of land is responsible for making states more prone to floods and landslides.
 - However, other factors such as a change in land use patterns and climate change could have contributed to the situation on the ground.
- **Deforestation:**
 - Unfettered development activity had increased the chances of landslides, a major cause of casualties during the floods.
- **Extra: Mismanagement of dams:**
 - *For dams to truly tame floods, experts say dam reservoirs need to be relatively empty before the onset of rain. This was not the case in many states.*
 - *Local officials have been blamed for exacerbating the situation by failing to gradually open the dams dotting the state's complex river network, waiting instead until they were already full before unleashing the excess water.*
 - *More flooding was caused by emergency releases from dams that were full. Despite forecasts of more rain, there were no controlled releases.*
 - **World Bank analysis** while preparing the National Hydrology Project (NHP) in 2015 showed that although weather forecasts are more accurate now, dam managers (especially bureaucrats) are reluctant to authorise advance controlled releases.

Measures needed for flood management:

- The dire need is for **watershed-based master planning and development legislated guidelines** for each major river basin, especially those that impact densely populated settlements.
- There must be a demarcation of ecologically sensitive zones using existing village survey maps and public participation.
- There must be clear land use plan for these zones specifying flood plains, protected forest areas, agricultural and plantation zones, with details of the types of crops, building usages permitted and the density of buildings permitted.
- To compensate owners in non-buildable areas, there must be strategies such as Transfer of Development Rights to buildable zones in cities.
- The master plan should focus on permitting only ecologically sensitive building strategies for these areas by proposing new construction techniques.
- Controlled development can be proposed using building height rules, floor area ratio control, and restrictions on cutting and filling natural land.
- Strategies to make sure that all infrastructure projects are carried out in a scientific manner with strict scrutiny must be specified.
- This should include roads built on difficult terrain and all public infrastructure projects in wetlands and the High Ranges.
- Copenhagen in Denmark, which faces a similar problem of repeated flooding, has come up with active cloudburst responsive planning as a process to develop the city in line with climate change needs.

Conclusion:

A complete overhaul of processes to hire technical expertise which allows access to necessary skills, and with a long-term vision of capacity building of local agencies, is the way forward.

Mangroves can act as first line of defence against coastal flooding. Elucidate. (250 words)

The hindu

Why this question:

The article discusses a case study dealing with significant contributions of mangroves to coastal flooding.

Key demand of the question:

One has to explain the importance of Mangroves as a strong mechanism to prevent and manage the issue of coastal flooding.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In brief state the recent coastal flooding witnessed by the Indian states like Kerala and Karnataka.

**Body:**

First explain the causative factors of coastal flooding.

Discuss the need to manage these floods; their impact.

Explain the role played by Mangroves – what are mangroves? Advantages and in what way they act as natural seawall.

Illustrate with suitable examples to justify better.

Conclusion:

Conclude with way forward.

Introduction:

Mangroves are salt tolerant trees, also called **halophytes**, which survive high salinity, tidal regimes, strong wind velocity, high temperature and muddy anaerobic soil – a combination of conditions hostile for other plants. The mangrove ecosystems constitute a symbiotic link or bridge between terrestrial and marine ecosystems. They are found in the inter-tidal zones of sheltered shore, estuaries, creeks, backwaters, lagoons, marshes and mud-flats.

Body:

Mangroves act as first line of defence against coastal flooding:

- Mangroves are to a coastal area what rain forests are to the Western Ghats.
- They are extremely important in maintaining a peaceful coastal ecosystem, as they form a **natural seawall**.
- Mangrove plants have (additional) special roots such as prop roots, pneumatophores which help to impede water flow and thereby enhance the deposition of sediment in areas (where it is already occurring), stabilize the coastal shores, provide breeding ground for fishes.
- It prevents soil erosion, protects the coastline and has its own ecological natural habitat. The floods of these two years made us think of what we could do to check flood waters and strengthen our coastline.
- Mangroves moderate monsoonal tidal floods and reduce inundation of coastal lowlands.
- They protect coastal lands from tsunami, hurricanes and floods.

Other significance:

- Mangroves are a rich zone of biodiversity, as they are the main breeding grounds of brackish water fish species.
- The trees offer sanctuary to a number of bird species.
- They play an active role in carbon sequestration
- Mangroves enhance natural recycling of nutrients.
- Mangrove supports numerous flora, avifauna and wild life.
- Provide a safe and favourable environment for breeding, spawning, rearing of several fishes.
- They supply timber, fire wood, medicinal plants and edible plants to local people.
- They provide numerous employment opportunities to local communities and augment their livelihood.

**Scientific management measures for conservation of Mangroves:**

- The mangrove species under grave threat must be included in **the Red List of the International Union for Conservation of Nature (IUCN)**.
- Suitable sites are to be identified for planting mangrove species. **Mangrove nursery banks** should be developed for propagation purposes.
- **Environmental monitoring in the existing mangrove** areas should be taken up systematically and periodically.
- Various threats to the mangrove resources and their root causes should be identified, and earnest measures should be taken to eliminate those causes.
- The **participation of the local community** should be made compulsory for conservation and management.
- **Floristic survey of mangroves** along the coast is to be taken up to prepare biodiversity atlas for mangroves.
- Potential areas are to be identified for implementing the management action plan for mangroves, especially in cyclone prone areas.
- Coastal industries and private owners need to be persuaded to actively participate in protecting and developing mangrove biodiversity.
- The forest department officials should be trained on taxonomy, biology and ecology of mangrove species.

Way forward:

- The impact of environmental and human interference on marine flora and fauna needs to be assessed.
- The traditional rights of coastal communities to use the natural resources in their surrounding natural habitats for their livelihood should also be recognised on priority basis.

Linkages between development and spread of extremism.

Discuss the significance of community-based natural resource management. Also, analyse to what extent it can aid in better provisioning of ecological services of a region. (250 words)

[Downtoearth](https://www.insightsias.com/downtoearth)

Introduction:

Community-based natural resource management (CBNRM) is a **people-centered approach to the integration of conservation of the natural resource base (water, soil, trees and local biodiversity) and development to overcome poverty, hunger and disease**. CBNRM was affirmed by the 1980 World Conservation Strategy of the International Union for Conservation of Nature (IUCN), and the Earth Summit's 1992 Statement of Forest Principles and the Convention on Biological Diversity.

Body:

**Significance of CBNRM:**

- **Multi-stakeholder collaboration** that involves all participants, from communities, to government, to NGOs, and promotes coordination among them.
- **Conflict management mechanisms** support processes to manage natural resource conflicts among stakeholders.
- **Participatory action research** collaborative fact-finding and analysis generates a mutually agreed upon perspective for action.
- Strong local organizations, such as forest-farmer groups and inter-village networks are built from the bottom-up.
- **Livelihood improvement and environmental services** work to sustain environmental conservation by linking it to farm and community enterprises.
- **Provide opportunities for reinvestment** by linking upland environmental services to lowland and urban communities.
- Policy support and law enforcement are essential to curbing illegal encroachment leading to ecosystem degradation.
- Collaborative management plans – build shared responsibilities and decision-making among all stakeholders through joint management plans of natural resources. This leads to healthy communities and ecosystems.
- **Participatory monitoring and evaluation** – promote learning, trust and accountability through monitoring of the natural resource base and application of the management plan.
- Gender and social justice in access to, and control of, natural resources is the ultimate measure of the sustainability of community-based natural resource management efforts.

CBNRM and provisioning of ecological services of a region:

- Most community-based natural resource management programmes may have only limited success at achieving both conservation and human development goals.
- But the concept appears to be the best opportunity for countries like India to achieve these two outcomes of conservation and human development goals.
- The most important part of the approach is that user rights are transferred from central government to local communities.
- The model is being increasingly promoted as a conservation tool and has become the dominant approach in natural resource conservation worldwide.
- It can help the country retain its place as one of the most famous and profitable wildlife tourism destinations in the world. And it can also contribute to other economic sectors and alleviate rural poverty.

Way forward:

- Awareness on environmental degradation, effects of climate change and possible peoples' collective actions to address these imminent challenges will be crucial, especially for the young generation in schools and colleges.

- Valuing local people's indigenous knowledge systems and practices will be the first step to prepare local hill communities for collective actions to restore and manage the already degraded and fragile hill ecosystems.
- Massive plantation drives ensuring new plantations of grass, shrubs and trees species suitable to the local agro-ecology and funded by the forest department, power companies and other development actors like NGOs/donor agencies.
- Revival and strengthening of village institutions like Van Panchayats, Youth clubs, Women's Groups/Collectives, Farmers' Collectives etc, will be important to ensure the decentralised conservation and management of common property resources and forest.
- Conscious and sustainable use and management of land, water and forest resources by local hill communities, ensuring natural regeneration processes, participatory planning, management and maintenance of natural resources will be crucial. Community level rules/bye-laws and enforcement mechanisms for sustainable management of natural resources will be useful in the long run.
- More collaborations and partnerships will be required among local communities, local self-governance bodies, government, academicians, universities, non-profits, Corporate Social responsibility Foundations, Himalayan Mountain Forum, social movements and networks and the larger civil society are needed to ensure community-based natural resource management and better provisioning of ecological services for the hill communities.

Conclusion:

Conservation of local areas by promoting the community has been highlighted by various instances such as **IUCN's Policy Statement on Sustainable Use of Wild Living Resources in 2000**, and **the Convention on Biological Diversity's 2004 Addis Ababa Principles and Guidelines for the Sustainable Use of Biodiversity**. Involving communities living in and around natural resource-rich areas in the management and use of these resources is an effective tool of conservation that has been recognised across the world.

Role of external state and non-state actors in creating challenges to internal security.

What should be the extents of focus if India desires to accomplish the goal of making a place for itself amongst the top 50, in the Ease of Doing Business Index by 2020?

Discuss the possible challenges it can face. Suggest solutions to the same. (250 words)

[Indianexpress](#)

Introduction:

India has secured 63rd position out of 190 countries in World Bank's Ease of Doing Business Report 2019 which is 14 places up since the last report. The ranking comes when the leading financing institutions including RBI, World Bank and IMF are slashing country's growth forecasts. In 2014, India was ranked 142 among 190 countries. As compared to 2018, India moved up 14 places in the ranking mainly due to several reforms in the trade and commerce sector.

Body:

India has also been placed on the list of economies with the most notable improvements on this index for the third year in a row. Further, this jump in the ranking, while it comes at a time when economic activity has slowed down sharply, moves India closer towards the target of being in the top 50 economies on this index.

Reasons for improved ranking:

- India's performance over the past year can be traced to significant gains made on four parameters, namely, resolving insolvency, dealing with construction permits, trading across borders, and registering property.
- On resolving insolvency, where India has seen the biggest gain this year, its performance has improved on both the time taken for the insolvency process to culminate, which has fallen from 4.3 years to 1.6 years, and on the recovery rate, which has risen from 26.5 to 71.6 cents on the dollar.
- Introduction of GST has made registration process faster; World Bank in its report had specifically mentioned Mumbai and Delhi.
- Implementation of the single-window clearance system in Delhi and the online building permit approval system in Mumbai. India has also streamlined and centralized its construction permitting process.
- India has also decreased border and documentary compliance time for both exports and imports.
- Sustained business reforms over the past several years.
- India conducted four reforms in the 12-month period to May 1. Among other improvements, India made the process of obtaining a building permit more efficient.
- Importing and exporting also became easier for companies with the creation of a single electronic platform for trade stakeholders, upgrades to port infrastructure and improvements to electronic submission of documents.

Challenges faced:

- India still lags in areas such as enforcing contracts (163rd) and registering property (154th).
- It takes 58 days and costs on average 7.8% of a property's value to register it, longer and at greater cost than among OECD high-income economies.
- It takes 1,445 days for a company to resolve a commercial dispute through a local first-instance court, almost three times the average time in OECD high-income economies.
- It takes approximately a month to start a business in India while the OECD average is 12 days. Though some states like Telangana have eased up the procedures for starting a business, this is yet to be achieved on a pan India basis.
- The procedures to secure permits are rather cumbersome and involve permissions to be sought from various departments.
- The implementation efficiency of Insolvency and Bankruptcy code is yet to be proven.

- Though India has seen a modest improvement in enforcing contracts, it now takes longer time than it did 15 years ago. The absence of effective means for enforcing contracts impedes growth and development and is a disincentive for the private sector.
- When the domestic market is sluggish, it is important that foreign trade is boosted.
- India's largest urban agglomerations, Mumbai and Delhi cannot host the kind of large factories to generate adequate employment. The procedural reforms have not yet reached the hinterland.
- Legislative roadblocks still exist for Land Acquisition.
- A plan for the industrial park in Gujarat with Singapore has been abandoned due to issues of land acquisition.
- Difficulty in cutting the red tape erodes the trust of investors and impedes the prospects of small businesses.
- Lack of coordination among different government ministries and departments, Central and State governments.

Measures needed to break into the top-50 rankings:

- India has significant room for improvisation in almost all the sub-indices.
- India fares among the best in access to credit in the South Asian region. Access to credit should be assured for small businesses and rural entrepreneurs through penetration of formal banking channels into rural areas.
- Effective implementation of reforms like **GST, Insolvency and Bankruptcy code** is needed. The limit of 180 days prescribed in Insolvency and Bankruptcy code should be pertained to.
- Governments should be proactive in obtaining regular feedback about the implementation and initiating the changes accordingly.
- States can work towards providing a **robust online system for registering property**.
- **Digitising land records, improving titling and streamlining procedures for transfer of property** should be taken up.
- Foreign trade needs to be boosted by cutting red tape and reducing transaction costs.
- A fair judicial and executive system need to be in place to achieve the confidence of domestic and foreign investors.
- Fast track commercial courts, paper-less courts need to be set up to speed up the judicial processes.
- Reforms should not be restricted to Mumbai and Delhi but should be implemented in the hinterland as well.
- Create awareness about the reforms and procedures of institutional arbitration.
- Labour compliances need to be eased.
- Bureaucracy needs to be well trained and should try to come out of its popular mindset of being lax and indifferent.

- In the spirit of cooperative and competitive federalism, all the states should initiate the best and proven practices for ease of doing business.
- The government's assessment of states for implementation of Business Reforms Action Plan is a step in the right direction and helps to reinforce the idea of competitive federalism.

Conclusion:

In 2015, the government's goal was to join the 50 top economies on the ease of doing business ranking by 2020. While the competition to move up the ladder would increase and become much tougher, India is on track to be within top 50 of the Ease of Doing business in the next year or two. And to come under 25 or below 50, the government needs to announce and start implementing next set of ambitious reforms now, as these reforms takes a few years to be realized on the ground.

INTEGRATED CLASSROOM COACHING(OGP) FOR FRESHERS

NEW BATCH Starts from 4th November 2019 at BENGALURU

Features

- ◆ Nearly 500 Hours of classroom teaching for freshers
- ◆ Special CSAT classes every week.
- ◆ Special Current Affairs classes every week
- ◆ Special Sessions on Essay and Mains answer writing
- ◆ 58 Full Length Prelims Mocks as part of OGP-2020 aligned with CLASSROOM TEACHING
- ◆ 12 Full Length Mains Tests
- ◆ Mentorship Program
- ◆ Individual attention – Guaranteed!
- ◆ Separate Mains test series after Prelims
- ◆ Interview guidance Program
- ◆ Unparalleled Guidance throughout your preparation
- ◆ Full time Psychotherapist will be at institute to ease students during Stressful Preparation
- ◆ **IGNITE@INSIGHTS**, a platform where eminent personalities with enormous knowledge from diverse fields interact with our students and motivate them. Recent Sessions were by **Mr. OP Choudhary** – former IAS officer, **Mr. Anil Swarup**- former Coal Secretary, **Mr. Deepak Gupta**- former UPSC Chairman

Optional Subjects Available

- ◆ **Public Administration classes and Test Series**
- ◆ **Anthropology Classes and Test Series**
- ◆ **Kannada Literature Classes & Test Series**

Indian Economy and issues relating to planning, mobilization of resources, growth, development and employment.

Use of trade barriers in the name of Fair trade is often just an excuse to raise more protectionist barriers to serve domestic special interest groups, do you agree? Justify your opinion with suitable examples. (250 words).

Introduction:

Free trade focuses on the reduction of barriers and policies that favour certain countries or industries. Fair trade, however, favours the rights of workers, improved working conditions and seeks to eliminate pay discrepancies from country to country. Free trade, which enjoys almost unanimous support among economists, has come under severe attack from politicians across the world.

Body:

Free trade policy is a trade policy that does not restrict imports or exports; it can also be understood as the free market idea applied to international trade.

Trade barriers raised in name of fair trade:

- Tariffs and other trade barriers are extremely popular among politicians. This can be attributed to the misconception that trade policy must be judged based on what good it does to a country's producers rather than consumers.
- The protectionist politician's argument is that increasing tariffs on foreign goods protects domestic industries from unfair trade practices adopted by foreign governments.
- U.S. President Donald Trump has accused China of ripping off the U.S. by, among other things, imposing high tariffs on American goods that are imported into China.
- China has artificially lowering the value of the yuan against the U.S. dollar in order to encourage Chinese exports.
- China has adopted domestic policies that favour local Chinese companies over American ones. Retaliatory tariffs, it is believed, will help level the playing field and ensure "fair trade".
- Another economic statistic that is misused to gather support for protectionist trade policies is the trade deficit.
- A trade deficit is seen as a bad thing since it indicates that the value of a country's imports is greater than the value of its exports.
- But economists such as Milton Friedman have argued against the view that a country loses wealth when it experiences a trade deficit.
- A trade deficit or surplus merely shows that people in different countries prefer to buy different things from one another.

Benefits of free trade and removal of trade barriers:

- The case for free trade does not depend simply on the condition that all countries must engage in "fair trade" practices.
- Trade does not have to be "fair" for countries to benefit from it.

- Competition between producers is usually considered good because, even though it could cause some of them to lose out, it benefits consumers who can buy cheaper and better goods.
- In fact, a country that drops all trade barriers on its side can benefit from such trade liberalisation even when other countries refuse to do the same.
- As the economist Paul Krugman wrote, “The economist’s case for free trade is essentially a unilateral case: A country serves its own interests by pursuing free trade regardless of what other countries may do”.
- This is because countries that remove trade barriers unilaterally, like Hong Kong and Singapore did, benefit their consumers, whose standard of living is improved greatly by access to foreign goods.
- By the same token, a country that raises trade barriers works against the interests of its own consumers.
- Of course, if all countries tore down their respective trade barriers, the world would be a richer place as goods can freely move around.
- But in the meantime, unilateral free trade can at least benefit consumers in countries that decide to fully adopt it.

Conclusion:

Fair trade is often just an excuse to raise more protectionist barriers to serve domestic special interest groups. The world would be a richer place if leaders chose free trade over “fair trade”.

Ratings agency Moody’s has lowered India’s outlook from stable to negative recently. How do such agencies assign these ratings? What do these ratings mean for India? Critically analyse.(250 words)

[Indianexpress](https://www.indianexpress.com)

Why this question:

The article brings out the discussion of recently accredited credit rating by Moody’s to India and the detailed analysis of the same.

Key demand of the question:

Explain what credit rating is, what is the significance of it, what has been the impact of Moody’s credit rating on India and provide for a detailed analysis.

Directive:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgment.

Structure of the answer:

Introduction:

First highlight the fact that Ratings agency Moody’s has lowered India’s outlook from stable to negative.

Body:

Discuss first what credit rating is – A credit rating is an assessment of the creditworthiness of a borrower in general terms or with respect to a particular debt or financial obligation.

A credit rating can be assigned to any entity that seeks to borrow money — an individual, corporation, state or provincial authority, or sovereign government.

Explain the significance of credit rating agencies, their role.

Discuss the concerned issues with credit rating agencies.

Conclusion:

Conclude with what should be the way forward.

Introduction:

Moody's has lowered India's credit rating outlook from **stable to negative** because of what it has assessed as risks to economic growth, prospects of a more entrenched slowdown, weak job creation, and a credit squeeze being faced by Non-Banking Finance Companies. Moody's India rating is a notch higher than that of Standard & Poor's (S&P). Whether it is Moody's or its peer Standard and Poor's (S&P), Indian policymakers have often criticised the credit ratings assigned by these agencies.

Body:

Methodology of assignment of ratings:

- Credit ratings agencies rate on a scale the financials and business models of companies, as well as economic management by sovereign governments, after analysing official and other data and interacting with government officials, business leaders, and economists.
- These agencies then rate instruments such as bonds, debentures, commercial papers, deposits, and other debt offerings of companies or governments to help investors make informed decisions.
- From a company's or a government's perspective, a better rating helps raise funds at a cheaper rate.
- The agencies do this on a continuous basis, either upgrading or downgrading the instrument based on performance, prospects, or events likely to have an impact on the balance sheet of a company or on the fiscal position of a government or a sub-sovereign entity.

Significance of the ratings for India:

- The decision to change the outlook to negative reflects increasing risks that economic growth will remain materially lower than in the past.
- It partly reflects the lower government and policy effectiveness at addressing long-standing economic and institutional weaknesses than Moody's had previously estimated, leading to a gradual rise in the debt burden from already high levels.
- Reduction in outlook is the first step towards an investment downgrade, as India is now just a notch above the investment grade country rating.
- An actual downgrade in country ratings can lead to massive foreign fund outflows.

Projections made by Moody's:

- **Governmental measures:**
 - The government pushed its expenditure on capital projects.
 - In October 2019, it gave away corporate tax concessions amounting to a whopping ₹1.45 lakh crore.
 - Even with the boost from the dividend payout of ₹1.76 lakh crore from the Reserve Bank of India, the budget arithmetic is optimistic.

- **Fiscal deficit:**

- It now appears certain that the government will miss the fiscal deficit target of 3.3% of GDP.
- Moody's has projected that the deficit will slip to 3.7% of GDP this fiscal year Of 2019-2020.
- Rating agencies are ultra-sensitive to fiscal deficit overruns but the positive factor here is that India's borrowings are wholly domestic.

- **External debt to GDP:**

- It is just 20% but the ratings do have an impact on investor sentiment.

Concerns:

- The growth slowdown and its effects on the fiscal deficit and borrowings are the main worries.
- Tax revenue growth is nowhere near budgeted levels.
- With the slowdown extending into the third quarter of 2019, it is clear that tax revenues will undershoot by a wide margin.
- The government has been forced to spend more to give a leg up to the economy

Government's views of the ratings:

- Noting Moody's concerns, the Finance Ministry said that India continues to be among the fastest growing major economies in the world, and India's relative standing remains unaffected.
- The Government said it has undertaken series of financial sector and other reforms to strengthen the economy as a whole.
- It has also proactively taken policy decisions in response to the global slowdown. These measures would lead to a positive outlook on India and would attract capital flows and stimulate investments.
- The fundamentals of the economy remain quite robust with inflation under check and bond yields low. India continues to offer strong prospects of growth in near and medium term.

Measures needed to boost the economy:

- The government needs to press the pedal harder on reforms and in debugging GST.
- It may also have little option than to go big on disinvestment in the remaining 4 months of this fiscal.
- The target of ₹1.05 lakh crore that it set for itself in the budget has to be bested by a wide margin if the fiscal deficit slippage is to be contained.
- The supportive measures announced in the last 2 months should be closely monitored for implementation.

With the manufacturing sector in India unable to provide employment opportunities to the youth, the digital platforms provide work to the growing demographic of youth in the country. In this context discuss the need for regulating them and the concerns associated with excessive regulation of these platforms.(250 words)

The hindu

Why this question:

The question is in the context of Karnataka State government's move to frame guidelines for workers of digital platforms like Uber, Ola, Zomato, Swiggy, UrbanClap, etc.

Key demand of the question:

One must highlight the significance of digital platforms and gig economy that they are creating and the optimal methods of regulating them.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief narrate the context of the question.

Body:

Explain first the Importance of digital platforms.

Discuss the significance of the move taken by the govt. of Karnataka; The move to frame the guidelines is to ensure that all relevant labour benefits are available to even those working in the 'gig economy'. The Karnataka government's move to add benefits can provide a degree of public welfare assistance to a significant and growing workforce in India.

Then discuss in detail the concerns associated.

Conclusion:

Conclude that while the government has the responsibility of ensuring social stability for all, any move in this direction must not create hurdles for the businesses. This will lead to loss of employment which in itself is a way to social security. The government needs to balance the views of all stakeholders.

Introduction:

Karnataka State government recently announced that it will work towards framing guidelines for workers of digital platforms like Uber, Ola, Zomato, Swiggy and UrbanClap, to ensure all relevant labour benefits for those working in the 'gig economy'. A gig economy is a work environment where organizations hire temporary workers or freelancers instead of full-time long-term employees. Globally, growth in freelancers is expected to be one of the most significant employment related trends over the next couple of decades. In India too, the signs of freelancing is becoming increasingly relevant and attracting professionals

Body:

Reasons for growth in Gig Economy jobs:

- Governments now actively acknowledge that platforms provide work to the growing demographic of youth in the country.
- At the moment, the manufacturing sector in India is unable to provide employment opportunities to the youth.
- There is thus a mismatch between education and jobs skills in the market.

- Governments have also been unable to create viable public work schemes in urban areas for those continuously migrating into cities and towns.
- Private tech, however, has been able to do this, and the government seems to be aware of its potential.

Concerns posed by Gig economy:

- It is making the work environment uncertain for the workers
- No labour welfare emoluments like pension, gratuity etc.
- Gig workers miss out on statutory safeguards with respect to unfair termination, minimum wages, paid leave, etc.
- Workers do not have the bargaining power to negotiate a fair deal with their employers.
- Banks and other financial service providers resist extending lines of credit when steady income is not assured
- In situations where teamwork is essential, gig worker teams formed and disbanded on a case-to-case basis will likely produce tardy, inconsistent and poor output
- Unionization of workers will be difficult.
- In industries such as information technology and pharmaceuticals where confidentiality becomes crucial, having control over the actions of a gig worker will be challenging.

Challenges in India:

- Minimum wages in India are woefully low. Earning an 'employee' status may not entitle them to more than what they currently make.
- Outside social security net: Social security laws like the EPF and ESI currently only cover employees earning below Rs 15,000 and Rs 21,000 per month, respectively.
- If drivers earn more, they may not be entitled to these benefits, even after they get employment status, leaving them in a position that isn't significantly better than before.
- Most Indian employment laws expressly prohibit dual employment, i.e. individuals cannot carry out two jobs if the total working hours exceed 8-9 hours a day based on location.
- Many gig workers work with multiple apps at the same time to supplement their income, which may become harder or illegal to do if they attain employment status with app operators.
- Security: A big drawback for a gig economy system was the lack of security for workers. Those working in the gig economy do not enjoy the same rights and protections as employed workers, such as health benefits, overtime pay and sick leave pay.

Measures needed:

- Basic labour protection like minimum wages, paid leave provisions and maternity benefits should be available to gig workers as well.
- The proposed Code on Wages and the Labour Code on Social Security are steps in the right direction.

- The state should balance the interests of business exigencies and social welfare.
- India can engage with the European Union and the United States, where discussion on protections in a gig economy is already underway.
- The government need to redefine labour laws that must not stifle innovation but certainly prevent exploitation.

Way forward:

- The ecosystem of public policy, platform work, and the government together can suggest an urban 'Jobs for All', a financialised employment guarantee scheme.
- The work created by these companies could easily be regulated as public goods in the coming years because it creates mobility and facilitates the movement of goods.
- An increasing number of these jobs has been created through incentivised demand using cashbacks, coupons, low fares, and even free services rather than through natural demand.
- Platforms have created public utilities that may not have been needed before via what is often low-skilled and poor quality work, but it is work that brings in some earnings.
- They have given urban workers a financialised, self-driven, optional economic safety net of 'having a job, having a gig'.

Conclusion:

The Karnataka government's move to add benefits is welcome and can provide a degree of public welfare assistance to a significant and growing workforce in India. The government needs to step in, not to regulate away flexibility but to build worker and workplace protection into the system. The business, as well as welfare considerations of the workers, should be well balanced.

Insolvency and Bankruptcy Code should be the preferred option for resolution of bad loans, not the last resort. Debate.(250 words)

[Indianexpress](https://www.indianexpress.com)

Why this question:

The article provides for a detailed analysis of the recent Supreme Court's verdict in the ArcelorMittal and Essar steel case.

Key demand of the question:

One has to examine the utility of IBC, and explain in what way it is the preferred option for resolution of bad loans, however not the last resort.

Directive:

Debate – Weigh up to what extent something is true. Persuade the reader of your argument by citing relevant research but also remember to point out any flaws and counter-arguments as well.

Conclude by stating clearly how far you agree with the original proposition.

Structure of the answer:

Introduction:

In brief highlight the provisions of IBC and bring out the gist of recent SC's verdict and its impact.

Body:

Explain that the IBC, 2016 is the bankruptcy law of India which seeks to consolidate the existing framework by creating a single law for insolvency and bankruptcy. The insolvency and bankruptcy code is often hailed as a significant reform in the Indian context for resolving insolvencies which previously was a long process that did not offer an economically viable arrangement.

The code aims to protect the interests of small investors and make the process of doing business less cumbersome. Though there have been a few positive results in its short history given that the recovery rates have improved considerably compared to the time period before its implementation, there is still scope for improving the recovery percentages.

Comment on the observations made by the court.

Take hints from the article and weigh the pros and cons of the code.

Conclusion:

Conclude with way forward.

Introduction:

The introduction of the Insolvency and Bankruptcy Code (IBC) marked a structural change in the resolution architecture in India. The shift to a time-bound resolution process — meant to facilitate the quick exit of firms — was a tool to help tackle the bad loan problem. The Supreme Court judgment in the **Essar Steel case** has restored the **primacy of the committee of creditors (CoC)**, settling the contentious issue of the distribution of funds between creditors.

Body:

IBC- the preferred option:

- **Unified law:** The interest of all parties i.e. lenders, borrowers and even operational creditors is now addressed under a unified law under the IBC.
- **Changed behavior of defaulters:** The IBC has given more teeth to lenders and has changed the credit behavior of borrowers. Now, there is a heartening trend of defaulters paying up dues before the case is admitted for insolvency under IBC.
- **Shift of control from debtor to creditor:** IBC proposes a paradigm shift from the existing 'Debtor in possession' to a 'Creditor in Control' regime, as now the Board of Directors is suspended in case of default and the IP manages the enterprise in the best interest of all its stakeholders.
- **Resolving the 'chakravayuh challenge':** IBC has made possible for struggling companies to 'exit' easily allowing creditors to take the company to the NCLT for winding up.
- **Spurs professionalism in financing sector:** IBC has reduced crony capitalism, under and over invoicing, serial defaulters and lead to better allocation of capital by limiting the escape routes for defaulters and water tight frame for disposal of cases

Drifting away from IBC:

- Initially, the IBC was touted as a game changer in dealing with bad loans.
- A few weeks ago, the minister of state for finance, signalling the shift in stance, said there should be an attempt to resolve stressed assets outside the IBC as it would help banks and the business community.
- Amongst banks, too, scepticism about the process appears to have crept in.
- Rather than taking companies to the NCLT, banks now appear to be in favour of resolving the bigger cases outside the IBC process.

Reasons for this shift away from IBC:

- **Delays in the resolution of cases and endless litigation**

- These have dampened enthusiasm for the process.
- Of the 1,497 cases that are currently going through the resolution process, 36 per cent have crossed 270 days, while another 22 per cent have crossed 180 days.
- As a time-bound resolution process was one of the most appealing aspects of IBC, such delays create little incentive for stakeholders to opt for this process.
- **Poor recovery rates:**
 - Barring a few cases, the recovery rates have not have been along expected lines. Part of the problem is that recovery rates tend to be pro-cyclical.
 - During high growth phases, businesses tend to be inclined to bid more for assets as expectations for higher returns are baked in.
 - The recovery rate under IBC currently stands at 41 per cent. But, this also needs to be qualified.
 - The higher recovery rates are driven partly by the resolution of steel companies during a period that coincided with high global steel prices.
 - Even Arcelor Mittal's bid for Essar Steel was made during this period. Excluding steel companies would significantly lower the recovery rates.
 - A slowing economy, coupled with an over-leveraged corporate sector, has reduced appetite for assets stuck in the NCLT.
 - Not only have recovery rates been low in the cases resolved, but more than half of the cases closed so far have ended up in liquidation as there have been no buyers.
 - In such a scenario, as banks would have to take huge haircuts, in both resolution and liquidation, there is little incentive to resolve bad loans through IBC.
- **Lack of clear precedents:**
 - This has complicated matters. For investors, it was hardly possible to calculate expected returns on their investment with any degree of certainty.
 - Instances such as the enforcement directorate attaching property, as in the case of Bhushan Power and Steel, have further disincentivised buyers.

Measures needed:

- The provisioning norms for bad loans should be made more stringent to ensure banks have strong incentives to take companies through this process and not postpone the decision, hoping to restructure the loan outside IBC.
- Relaxing the 330-day deadline will further dampen enthusiasm. The idea of having a time-bound process was to put pressure on the CoC to ensure speedy resolution. Delays in either taking the company to NCLT or in the resolution process destroys enterprise value. This decision must be reviewed.
- The government should establish the supremacy of IBC to ensure that assets are not allowed to be attached once they have been admitted.

- Under Section 53 of the law, amounts due to the central government rank below those of secured and unsecured creditors. This hierarchy needs to be respected.
- There also needs to be clarity on the role of promoters. While barring all promoters from bidding was a harsh step, there needs to be consistency of approach.

Conclusion:

IBC as a structural reform has demonstrable impact, which is reflected in behavioural change among debtors, creditors and other stakeholders, it is the IBC or the insolvency law which has trumped even the GST.

Explain how consumer spending surveys can aid gauge demand and growth trends in the economy? What will be the impact of withholding the current CES on policy making? Elucidate.(250 words)

The hindu

Why this question:

Recently, the government announced that in view of “data quality issues” the Ministry of Statistics and Programme Implementation had decided not to release the results of the all-India Household Consumer Expenditure Survey conducted by the National Statistical Office (NSO) during 2017-2018. Thus the question.

Key demand of the question:

One must discuss the significance of consumer spending surveys and their significance in policy making.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In brief narrate What CES is.

Body:

The CES is traditionally a quinquennial (recurring every five years) survey conducted by the government’s National Sample Survey Office (NSSO) that is designed to collect information on the consumption spending patterns of households across the country, both urban and rural.

The data gathered in this exercise reveals the average expenditure on goods (food and non-food) and services and helps generate estimates of household Monthly Per Capita Consumer Expenditure (MPCE) as well as the distribution of households and persons over the MPCE classes.

Explain its utility.

Discuss why the latest survey has become controversial.

Conclusion:

Conclude with way forward.

Introduction:

The **consumer spending surveys (CES)** is traditionally a **quinquennial** (recurring every five years) **survey** conducted by the government’s **National Sample Survey Office (NSSO)** that is designed to collect information on the consumption spending patterns of households across the country, both urban and rural.

The government recently announced that in view of “data quality issues” the Ministry of Statistics and Programme Implementation had decided not to release the results of the all-India Household Consumer Expenditure Survey conducted by the National Statistical Office (NSO) during 2017-2018.

Body:

Uses of CES:

- The estimates of monthly per capita consumption spending are vital in gauging the demand dynamics of the economy.
- It is also used for understanding the shifting priorities in terms of baskets of goods and services, and in assessing living standards and growth trends across multiple strata.
- From helping policymakers spot and address possible structural anomalies that may cause demand to shift in a particular manner in a specific socio-economic or regional cohort of the population.
- It provides pointers to producers of goods and providers of services, the CES is an invaluable analytical as well as forecasting tool.
- It is, in fact, used by the government in rebasing the GDP and other macro-economic indicators.

Impact of withholding the current CES on policy making:

- The government's decision to withhold the survey's findings deprives policymakers of invaluable contemporary consumption data that would have helped **drive their intervention strategies**.
- Instead of a six-year gap, the next survey's findings — depending on when the Ministry decides to actually undertake it, 2020-21 or 2021-22 — would end up coming after 9 or 10 years after the 2011-12 round.
- With the Advisory Committee on National Accounts Statistics also having separately recommended that 2017-18 would not be used as an appropriate year for rebasing of the GDP series, the very credibility of GDP data going forward could come under greater scrutiny.

Lessons from the previous survey:

- Apart from the omnibus '**Key Indicators of Household Consumer Expenditure in India, 2011-12**' the Ministry released as many as six detailed reports on varied aspects of household consumer expenditure based on the survey.
- These included the '**Level and Pattern of Consumer Expenditure 2011-12**', '**Household Consumption of Various Goods and Services in India, 2011-12**' and the invaluable '**Nutritional Intake in India, 2011-12**'.
- There were also detailed findings on the **energy sources used by households for cooking and lighting** and another report on the **Public Distribution System and other sources of household consumption**.
- Several researchers had also pointed to the widening inequality revealed by the 2011-12 survey: in terms of sharp variations between States with better socio-economic indices and those still aiming to improve, the urban-rural divide and the gap between the highest spending and the lowest spending fractiles.
- The previous report on nutritional intake also showed a big gulf in the consumption patterns of urban and rural households and a similar chasm between the top 5% and the bottom 5% on food products contributing to nutrition.

Conclusion:

As a subscriber to the International Monetary Fund's Special Data Dissemination Standard (SDDS), India is obliged to follow good practices in four areas in disseminating macroeconomic statistics to the public. These comprise the coverage, periodicity, and timeliness of data; public access to those data; data integrity; and data quality.

Major crops cropping patterns in various parts of the country, different types of irrigation and irrigation systems storage, transport and marketing of agricultural produce and issues and related constraints; e-technology in the aid of farmers In the context of the stated aim of doubling farmer's income, discuss the challenges involved in realizing the same and also suggest suitable measures required to overcome them. (250 words).

Introduction:

Government presented the vision of doubling farmer incomes by 2022-23 however there was no assessment of the base (2015-16) aggregate income levels. Germany has told India it can play key role in doubling farmers' income as the European nation has the expertise in farm mechanisation and post-harvest management

Body:

Challenges involved in realizing the aim of doubling farmer's income:

- **High Input costs:**
 - Land degradation has become a major challenge and cost of farming is constantly rising with usage of fertilizer, pesticides, expensive seed varieties, machinery, labour cost, rise in fuel prices, vagaries of monsoon. This further complicates the livelihood of farmers
 - In India, farmers are poor due to low productivity (yield per hectare) of all major crops.
 - Growth in rural lending has decreased and indeed most of the rural lending is indirect rather than direct.
- **Farmers income remained low:**
 - India had record food production in 2017-18, but farmers' income remained low and stagnant.
 - According to Ashok Dalwai committee, farmer's income remained about 15-40% of consumer's price.
 - Studies conducted by the International Food Policy Research Institute and World Bank have confirmed this.
- **Government Policies:**
 - India has excessively dependent on MSP to drive crop planning by farmers. MSP is restricted only to few crops.
 - In good harvest years, neither are MSP increased to ensure a floor price that covers costs and offers a remunerative return, nor is enough procured to ensure that even the MSP offered serves as a floor for market prices.
 - The government continues to use old draconian measures, including stocking restrictions and bans on exports and futures trading, to even small increase in food prices. Such steps may bring temporary relief to consumers, but end up hurting farmers.
 - Fiscal conservatism has adversely affected public investment in irrigation, drainage and flood control.
 - Liberalised imports of agricultural commodities including foodgrains and cotton have dampened domestic prices
- **Middlemen troubles:**
 - As pointed out by Ramesh Chand, in Punjab, there are as many as 22,000 commission agents and innumerable middlemen in each market.

- According to Ashok Gulati, former chairman of the Commission for Agricultural Costs and Prices, commission agents in Delhi charge exorbitant fees ranging from 6 per cent to 15 per cent.
- **Rigid Market Structure:**
 - Prevalence of APMC markets, trader cartels due to which low price for agri produce is offered specially due to bumper crop production.
- **Poor Infrastructure and Logistics:**
 - Lack of diffusion of adequate storage facilities lead to wastage. For instance, farmers dump truckloads of vegetables on road.
 - Food Parks projects concentrated near to cities and poor maintenance leads to spoilage of the crops.
 - Cold storage units exist in less than one-tenth of the markets and grading facilities in less than one-third; electronic weigh-bridges are available only in a few markets.
- **Aggressive cultivation led to plunge in demand:**
 - Once prices have increased farmers cultivated the crop aggressively leading to plunging of prices.
 - Two years ago, garlic fetched an average Rs 60 per kg rate in Rajasthan's Kota mandi. Enthused by it, farmers in the Hadoti region planted more area, only to see prices halve last May.
 - Similar was the case for other vegetables. Example: Tomato, Toor Dal etc.
- **Pro-Consumer bias:**
 - In most years, for the majority of agri-products, the policymakers used restrictive export policies to keep domestic prices low. This showed the pro-consumer bias in the policy complex.
- **Information Asymmetry:**
 - A bumper crop can pull down prices in wholesale markets. Price spikes after a poor crop are inevitably dealt with through cheap imports in a bid to protect consumers. The opposite is done less frequently. This is due to lack of information.
 - The bountiful rains of 2016 resulted in record farm output. Prices crashed. Farmers are reported to have not been able to even recover the cost for some crops.
 - The prospects of a good monsoon pushed up rural wages. The reality of rock bottom prices then destroyed profit margins.

Government has set up many committees like **Swaminathan committee and the recent Ashok Dalwai committee** to give solutions to agrarian distress in India. The **measures that can help agrarian distress in the country are as follows:**

- **Credit, finance and Insurance:**

- Raising the MSP, price deficiency payments or income support schemes can only be a partial solution to the problem of providing remunerative returns to farmers.
- A **functional institutional credit system** which is accessible and accountable to all cultivators.
- This covers not only land-owning farmers but also sharecroppers, tenants, adivasi and women farmers, and animal-rearers.
- Credit products for agriculture need to be tailor-made based on cropping and rain cycle, specific to a particular region. The regional offices of commercial banks should contribute in this exercise. Registration of all cultivators and providing Kisan credit cards.
- The period of crop loan should be extendable to four years, given that, on average, every second or third year the spatial distribution of rain pattern is erratic in India.
- **Land holdings:**
- The average size of farm holdings **declined from 2.3 hectares in 1970-71 to 1.08 hectares in 2015-16.**
- Policies for land consolidation along with land development activities in order to tackle the challenge of the low average size of holdings.
- Farmers can **voluntarily come together** and pool land to gain the benefits of size. Through consolidation, farmers can reap the economies of scale both in input procurement and output marketing.
- **Input Costs:**
 - It is more important to make agriculture sustainable by reducing input costs of seeds, fertilizers and other inputs.
 - Investment in infrastructure and research and development are needed.
 - There is a need for collaboration of **industry-academia** for coming out with cost-effective solutions to agrarian distress.
 - There is a need to make a shift from rice and wheat-centric policies to millets, pulses, fruits, vegetables, livestock and fish.
- **Remunerative Prices:**
 - Extending reach of minimum support price which has been dedicated to few crops and in a narrow geographical area is important.
 - Set up of Futures and Trade markets, tie up of farmer and private companies for procurement should be looked into as alternative methods against distress sale.
- **Agro- Produce Marketing and Processing:**
 - The creation of a **competitive, stable and unified national market** is needed for farmers to get better prices.

- For better price for farmers, agriculture has to go beyond farming and **develop a value chain comprising farming, wholesaling, warehousing, logistics, processing and retailing.**
 - The agro-processing industry and warehousing needs to expand so that agricultural produce can be stored when prices plunge.
 - Promoting viable farmer collectives to act as a “collective voice of marginal and small farmers”.
 - Legislations on the basis of NITI Aayog’s new model law — **Agricultural Produce and Livestock Marketing (Promotion and Facilitating) Act (APLM)** should be enacted in all states.
 - A sustainable solution is market reforms to enable better price discovery combined with long-term trade policies favourable to exports.
- **Technology:**
 - Use water-use efficient technologies that can improve significantly the produce like drip irrigation and sprinkler irrigation.
 - Precision agriculture, GM Crops should be encouraged drought prone areas.
 - Space technology and Mobiles should act as “Eyes and Ears” of the farmers to assist in farming.
 - **Distress Management:**
 - Establish farmers’ distress and disaster relief commissions at the national and State levels, based on the model of **Kerala Farmers’ Debt Relief Commission.**

Conclusion:

To achieve government’s goal of doubling farmers’ incomes by 2022-23, the Dalwai Committee points out that farmers’ real incomes need to grow at 10.4 per annum, that is 2.8 times the growth rate achieved historically. To secure future of agriculture and to improve livelihood of half of India’s population, adequate attention needs to be given to improve the welfare of farmers and raise agricultural income. It is essential to mobilize States and UTs to own and achieve the goal of doubling farmers’ income with active focus on capacity building (technology adoption and awareness) of farmers that will be the catalyst to boost farmers’ income.

Issues related to direct and indirect farm subsidies and minimum support prices; Public Distribution System- objectives, functioning, limitations, revamping; issues of buffer stocks and food security; Technology missions; economics of animal-rearing.

Discuss the pattern in the distribution of Livestock based industry in India. (250 words).

Introduction:

India’s livestock sector is one of the largest in the world. Livestock sector plays an important role in Indian economy. It is a source of subsidiary income for many families in India especially the

poor. Animals provide nutrient-rich food products, draught power, dung as organic manure and domestic fuel, hides & skin, and are a regular source of cash income for rural households. They are a natural capital, which can be easily reproduced to act as a living bank with offspring as interest, and an insurance against income shocks of crop failure and natural calamities.

Body:

Trends in livestock population: (Source: 20th Livestock Census)

- Total Livestock population is 535.78 million- an increase of 4.6% over Livestock Census-2012.
- Total Bovine population (Cattle, Buffalo, Mithun and Yak)-79 Million in 2019- an increase of about 1% over the previous census.
- A **decline of 6 % in the total Indigenous/ Non-descript cattle** population over the previous census.
- The population of cows in the country has risen by 18 per cent in the last seven years, while that of oxen dipped by 30 per cent, according to the latest census of livestock.
- there was a spectacular 16.8 per cent increase in the poultry population in the country to 851.81 million, mainly on account of a 46 per cent rise in backyard poultry birds, whose numbers have gone up to 317 million.
- The number of female cattle is 145.12 million, which is 18 per cent over the 122.98 million in 2012. The number of male cattle, on the other hand, dropped to 47.4 million as against 67.92 million in 2012.
- While cattle accounted for 35.94 per cent of total livestock in the country, goats accounted for 27.80 per cent, buffaloes: 20.45 per cent, sheep: 13.87 per cent and pigs: 1.69 per cent.

Pattern in the distribution of Livestock based industry in India:

- About 20.5 million people depend upon livestock for their livelihood.
- Livestock contributed 16% to the income of small farm households as against an average of 14% for all rural households.
- Livestock provides livelihood to two-third of rural community. It also provides employment to about 8.8 % of the population in India.
- India has vast livestock resources. Livestock sector contributes 4.11% GDP and 25.6% of total Agriculture GDP.

Measures needed to strengthen livestock industry:

- A national breeding policy is needed to upgrade the best performing indigenous breeds.
- Buffalo breeding ought to be given more attention, while poultry breeding should be focused on conservation.
- State governments should be encouraged to participate in national breeding policy implementation. Geographical information system-based analysis must be utilised to map production systems.
- Animal health care should become a priority, with greater investment in preventive health care.

- Private investment must also be encouraged. The government needs to create better incentive structures for investment in livestock.
- State governments should sponsor research and assessment of the market, along with highlighting investment potential.

Conclusion:

With increasing population, persistent rise in food inflation, unfortunate rise in farmer's suicide and majority of the Indian population having agriculture as the primary occupation, the practice of animal husbandry is no more a choice, but a need in contemporary scenario. Its successful, sustainable and skilful implementation will go a long way in ameliorating the socio-economic condition of lower strata of our society. Linking the animal husbandry with food processing industry, agriculture, researches & patents has all the possible potential to make India a nutritional power house of the world. Animal husbandry is the imperative hope, definite desire and urgent panacea for India as well as the world.

Do you think reviewing open-ended procurement and shifting towards private procurement to correct market inefficiencies is worth serious consideration as suggested by CACP? Analyse. (250 words)

[Financial Express](#)

Why this question:

CACP, in its latest report for rabi season, has batted for direct procurement by private players, as envisaged under the Private Procurement Stockist Scheme. Thus the question.

Key demand of the question:

One has to provide for a detailed analysis of the benefits of using open-ended procurement and shifting towards private procurement to correct market inefficiencies.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

In short explain the role played by CACP to handle market inefficiencies.

Body:

The article very well explains why the govt. should opt for an open-ended grain procurement policy. Discuss the role played by the policy of MSP and the DBT experiment etc.

Analyse in what way the open-ended grain procurement policy may benefit the agriculture sector and discuss the associated challenges.

Conclusion:

Conclude with significance of such policies and need for a balanced approach.

Introduction:

The Commission for Agricultural Costs & Prices (CACP since 1985, earlier named as Agricultural Prices Commission) came into existence in January 1965. CACP, in its latest report for rabi season, has batted for direct procurement by private players, as envisaged under the Private Procurement Stockist Scheme.

Body:

**Need for a shift towards private procurement:**

- The open procurement policy has led to mounting food stocks and adversely affected crop diversification.
- These excess stocks create storage problems and also high storage and financing costs, leading to high subsidy.
- As of October 1, against a buffer requirement of 30.8 million tonnes (mt) of wheat and rice, the total central pool stock, including stock in transit, stood at 64.2 mt—**109% more than the requirement.**
- With paddy procurement yet to happen, this quantity will shoot up.
- The government has taken steps to liquidate 15 mt of stocks, but hasn't met much success here.
- The purpose of open-ended procurement was to provide support to farmers, given the MSP hikes, this seriously weighed down the government's finances.
- The Centre has made the Food Corporation of India shoulder this burden. Even as the economic cost of wheat increased 31.3% between FY14 and FY19, despite a 10-15% fall in the sale of subsidised grains, with no change in selling price via ration shops, the subsidy bill doubled from Rs 92,000 crore in FY14 to Rs 1,71,298 crore in FY19.
- This is the reason why long-term debt levels for FCI stand at Rs 200,000 crore, with an additional Rs 80,000 crore of short-term debt.

But private procurement alone will not suffice due to:

- As long as the government continues with MSP as its primary tool for farm support, kindling private players' interest in procurement of grains will prove difficult since no private trader will be willing to procure grains at a price higher than the market price, which is usually the case with MSP.
- Apart from quality issues with grains, the MSP regime also hinders liquidation of stocks through export since it will trigger violations of WTO norms.
- Given how MSP benefits only a small pool of farmers from a handful of states while distorting agricultural production in favour of a few crops, the government will be meaningfully supporting farmers if it were to give per-acre support.
- Farmers prefer to grow rice and wheat because the prices received are getting better by the day. Therefore, they are reluctant to migrate to other crops such as oilseeds and pulses, where typically the nation runs an import bill. This has skewed the cropping pattern in the country.

Measures needed:

- While MSP guarantees that farmers grow only certain kinds of crops, and subsidies on fertiliser and electricity mean indiscriminate use of these resources, a **fixed per-acre support scheme will help cut down wastage.**

- FCI can still maintain its buffer stock, but the PDS can be disbanded, as a NITI Aayog study shows that people tend to graduate to a higher quality of grains once they are allowed freedom and flexibility to choose.
- the procurement system has to be made closed-ended where FCI can go up to a certain margin over the buffer norms. While this can be based on a first-come-first-served basis, the unique ID can be used for bringing about a quota system where FCI purchases only up to a certain level from every farmer.
- Alternatively, farmers can be provided cash transfers which will be the price difference between the market price and MSP. This can be achieved in a transparent manner, if they can be made to sell on electronic commodity exchanges where there is an audit trail and one can eschew adverse selection.
- On the cropping side, the government should aim at providing incentives to farmers growing other alternative crops such as pulses and oilseeds. A cash bonus could be considered, based again on the unique ID.

Conclusion:

We certainly need to move away from open-ended schemes while retaining the ethos of not diluting the present benefits to farmers in a smarter manner. Or else the skewed farm matrix will continue to dominate our farm topography, which is not desirable.

Extra information: Functions of CACP:

- *It is mandated to recommend minimum support prices (MSPs) to incentivize the cultivators to adopt modern technology, and raise productivity and overall grain production in line with the emerging demand patterns in the country.*
- *Assurance of a remunerative and stable price environment is considered very important for increasing agricultural production and productivity since the market place for agricultural produce tends to be inherently unstable, which often inflict undue losses on the growers, even when they adopt the best available technology package and produce efficiently.*
- *Towards this end, MSP for major agricultural products are fixed by the government, each year, after taking into account the recommendations of the Commission.*
- *As of now, CACP recommends MSPs of 23 commodities, which comprise 7 cereals (paddy, wheat, maize, sorghum, pearl millet, barley and ragi), 5 pulses (gram, tur, moong, urad, lentil), 7 oilseeds (groundnut, rapeseed-mustard, soyabean, seasmum, sunflower, safflower, nigerseed), and 4 commercial crops (copra, sugarcane, cotton and raw jute).*

Discuss the scope & challenges of aquaculture in India.(250 words)

Reference

Why this question:

The question is based on the aspects of aquaculture.

Key demand of the question:

One must present a detailed discussion on the scope & challenges of aquaculture in India.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define Aquaculture and provide certain facts regarding the aquaculture in India.

Body:

Aquaculture (aqua farming) means farming of aquatic organisms in both coastal (saltwater) and inland (freshwater) areas. As per FAO, aquaculture in India accounts for 85% of the total fish production.

Write about the scope of aquaculture in India and then in brief mention about the challenges associated with it.

Discuss the steps taken by the government in this direction like Matsya Sampada Yojna etc.

Conclusion:

Conclude with way forward to tackle the above challenges and the prospects it holds for the economy in future.

Introduction:

Aquaculture or aqua farming is the cultivation of aquatic organisms – fish, shellfish and aquatic plants. Farming implies some form of intervention in the rearing process to enhance production, such as regular stocking, feeding, protection from predators, etc. It includes both marine water and freshwater species and can range from land based to open ocean production.

Body:

Scope:

- Aquaculture resources in India include 2.36 million ha of ponds and tanks, 0.798 million ha of flood plain lakes/derelict waters plus in addition 195 210 km of rivers and canals, 2.907 million ha of reservoirs and that could be utilized for aquaculture purposes.
- The total fish production during 2017-18 is estimated to be 12.60 million metric tonnes, of which nearly 65% is from inland sector and about 50% of the total production is from culture fisheries, and constitutes about 6.3% of the global fish production.
- India has over 3,000 species of fish, two-thirds of which are marine, a third are freshwater, and over 100 are brackish-water. In the past few years, in addition to whiteleg shrimp in

brackish water, freshwater species like pangasius (a kind of catfish) and tilapia have become popular in aquaculture.

- Ponds and tanks are the prime resources for freshwater aquaculture, however, only about 40 percent of the available area is used for aquaculture currently.
- It has been estimated that about 1.2 million ha of potential brackish water area available in India is suitable for farming.
- In addition to this, about 9.0 million ha of salt affected areas are also available.
- The farming of shrimp is largely dependent on small holdings of less than 2 ha, these farms account for over 90 percent of the total area utilized for shrimp culture.
- More than 50 different types of fish and shellfish products are being exported to 75 countries around the world.
- Fish and fish products have presently emerged as the largest group in agricultural exports from India, with 13.77 lakh tonnes in terms of quantity and Rs. 45,106.89 crore in value.
- This accounts for around 10% of the total exports and nearly 20% of the agricultural exports, and contribute to about 0.91% of the GDP and 5.23% to the Ag – GVA of the country.
- With over 2.4 lakh fishing crafts operating along the coast, 7 major fishing harbours, 75 minor fishing harbours and 1,537 landing centres are functioning to cater to the needs of over 4.0 million fisher folk.
- For promoting aquaculture, 429 Fish Farmers Development Agencies (FFDAs) and 39 Brackish water Fish Farms Development Agencies (BFDAs) were established in the country.

Challenges:

- At present, freshwater aquaculture system remains restricted to carp culture in a few private ponds, prawn cum paddy culture in limited areas, stocking of carps in a few irrigation reservoirs, and river ranching in a few rivers on a limited scale.
- No serious effort has been taken to develop coldwater fish culture, game fisheries, culture of indigenous fish species of India, freshwater pearls, etc.
- ornamental fish industry still prefers imported feeds due to lack of indigenously- made feeds of good quality.
- In shrimp culture, only 15 percent of the potential area has been put into culture purpose.
- Most of the freshwater fishes are marketed whole without any processing. No effort has been taken to make value-added products like fish fillets, surimi etc.
- It has also brought vast un-utilized and under-utilized land and water resources under culture
- Over the years, however, culture practices have undergone considerable intensification and with the possibility of obtaining high productivity levels there has been a state of flux between the different farming practices.

- In the brackish water sector there were issues of waste generation, conversion of agricultural land, salinization, degradation of soil and the environment due to the extensive use of drugs and chemicals, destruction of mangroves and so on.
- in many cases, aquaculture administration still falls under more than one agency, which often hinders progress.

Way forward:

- Advanced farming practices such as cage culture; pen culture and running water culture are emerging in many places, and have great potential for utilizing vast areas of freshwater bodies in India.
- The cultivable space could be more effectively enhanced by utilizing the available water area, and facilitating easier harvesting compared to the conventional farming in earthen ponds.
- Cage culture does not affect the indigenous flora and fauna of the reservoirs or their water flow characteristics, and is therefore ecologically safe.
- The rich resources of wetlands, which remain fallow during major parts of the year could be brought under freshwater prawn farming to enhance production and productivity from these fallow water bodies.
- Serious effort to protect the biodiversity is needed in the case of indigenous ornamental fishes and coldwater fishes.

Conclusion:

Aquaculture over recent years has not only led to substantial socio-economic benefits such as increased nutritional levels, income, employment and foreign exchange. With freshwater aquaculture being compatible with other farming systems, it is largely environmentally friendly and provides for recycling and utilization of several types of organic wastes.

Food processing and related industries in India- scope and significance, location, upstream and downstream requirements, supply chain management.

Livestock is the lifeline of the Indian Agro-based economy, in this context Discuss the role that Livestock plays in the socio-economic life of India. (250 words)

[The hindu](#)

Why this question:

The tariff clauses for agriculture in the RCEP are much more severe compared to the existing World Trade Organization (WTO) agreement. While the WTO allows a country to fix tariffs up to a certain maximum, or bound tariff, for a given commodity line, the RCEP binds countries to reduce that level to zero within the next 15 years. Currently, India's average bound tariff for dairy products is about 63.8% while its average applied tariff is 34.8%. Thus the question.

Key demand of the question:

The question aims to ascertain the significance of Livestock to Indian Agro-based economy and its role in the socio-economic life of the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief discuss the Indian Dairy scenario with key facts and statistics.

Body:

A key feature of India's dairy sector is the predominance of small producers. In 2017, if the average herd size in a dairy farm was 191 in the U.S., 355 in Oceania, 148 in the U.K. and 160 in Denmark, it was just 2 in India.

Consequent to Operation Flood of the 1960s, India's contribution to world milk production rose from 5% in 1970 to 20% in 2018. Today, India is largely self-sufficient in milk production. It does not import or export milk in any significant quantity.

Give a brief account on the global scenario.

Explain the Significance of Dairy sector to India.

Discuss that In India, livestock provides regular, supplementary income to producers engaged in secondary and tertiary forms related to livestock business.

Discuss the effect of recently concluded negotiations at RCEP.

Conclusion:

Conclude that any future negotiations must keep in mind the significance of the dairy sector to India not just in the economic context but also in its unique role in the social transformation of the rural landscape.

Introduction:

India's livestock sector is one of the largest in the world. About 20.5 million people depend upon livestock for their livelihood. Livestock contributed 16% to the income of small farm households as against an average of 14% for all rural households. Livestock provides livelihood to two-third of rural community. It also provides employment to about 8.8 % of the population in India. India has vast livestock resources. Livestock sector contributes 4.11% GDP and 25.6% of total Agriculture GDP.

India's withdrawal from the Regional Comprehensive Economic Partnership (RCEP) is considered as a major victory for the farmer's organisations, trade unions, MSME organisations and civil society groups, which had protested against the free trade agreement. RCEP would have proven suicidal for India's dairy sector.

Body:

Trends in livestock population: (Source: 20th Livestock Census)

- Total Livestock population is 535.78 million- an increase of 4.6% over Livestock Census-2012.
- Total Bovine population (Cattle, Buffalo, Mithun and Yak)-79 Million in 2019- an increase of about 1% over the previous census.
- A decline of 6 % in the total Indigenous/ Non-descript cattle population over the previous census.
- The population of cows in the country has risen by 18 per cent in the last seven years, while that of oxen dipped by 30 per cent, according to the latest census of livestock.
- there was a spectacular 16.8 per cent increase in the poultry population in the country to 851.81 million, mainly on account of a 46 per cent rise in backyard poultry birds, whose numbers have gone up to 317 million.

- The number of female cattle is 145.12 million, which is 18 per cent over the 122.98 million in 2012. The number of male cattle, on the other hand, dropped to 47.4 million as against 67.92 million in 2012.
- While cattle accounted for 35.94 per cent of total livestock in the country, goats accounted for 27.80 per cent, buffaloes: 20.45 per cent, sheep: 13.87 per cent and pigs: 1.69 per cent.

Role of livestock in socio-economic life of India:

The livestock plays an important role in the economy of farmers. The farmers in India maintain mixed farming system i.e. a combination of crop and livestock where the output of one enterprise becomes the input of another enterprise thereby realize the resource efficiency. The livestock serve the farmers in different ways.

- **Income:**
 - Livestock is a source of subsidiary income for many families in India especially the resource poor who maintain few heads of animals.
 - Cows and buffaloes if in milk will provide regular income to the livestock farmers through sale of milk.
 - Animals like sheep and goat serve as sources of income during emergencies to meet exigencies like marriages, treatment of sick persons, children education, repair of houses etc.
 - The animals also serve as moving banks and assets which provide economic security to the owners.
- **Employment:**
 - A large number of people in India being less literate and unskilled depend upon agriculture for their livelihoods.
 - But agriculture being seasonal in nature could provide employment for a maximum of 180 days in a year.
 - The land less and less land people depend upon livestock for utilizing their labour during lean agricultural season.
- **Food:**
 - The livestock products such as milk, meat and eggs are an important source of animal protein to the members of the livestock owners.
 - The per capita availability of milk is around 355 g / day; eggs is 69 / annum;
- **Social security:**
 - The animals offer social security to the owners in terms of their status in the society.
 - The families especially the landless which own animals are better placed than those who do not.
 - Gifting of animals during marriages is a very common phenomenon in different parts of the country.

- Rearing of animals is a part of the Indian culture. Animals are used for various socio religious functions.
- Cows for house warming ceremonies; rams, bucks and chicken for sacrifice during festive seasons;
- Bulls and Cows are worshipped during various religious functions. Many owners develop attachment to their animals.
- **Gender equity:**
 - Animal husbandry promotes gender equity.
 - More than three-fourth of the labour demand in livestock production is met by women.
 - The share of women employment in livestock sector is around 90% in Punjab and Haryana where dairying is a prominent activity and animals are stall-fed.
- **Draft:**
 - The bullocks are the back bone of Indian agriculture.
 - The farmers especially the marginal and small depend upon bullocks for ploughing, carting and transport of both inputs and outputs.
- **Dung:**
 - In rural areas dung is used for several purposes which include fuel (dung cakes), fertilizer (farm yard manure), and plastering material (poor man's cement).

Conclusion:

With increasing population, persistent rise in food inflation, unfortunate rise in farmer's suicide and majority of the Indian population having agriculture as the primary occupation, the practice of animal husbandry is no more a choice, but a need in contemporary scenario. Its successful, sustainable and skilful implementation will go a long way in ameliorating the socio-economic condition of lower strata of our society. Linking the animal husbandry with food processing industry, agriculture, researches & patents has all the possible potential to make India a nutritional power house of the world. Animal husbandry is the imperative hope, definite desire and urgent panacea for India as well as the world.

Science and Technology- developments and their applications and effects in everyday life; Achievements of Indians in science & technology; indigenization of technology and developing new technology.

Despite the natural advantages, inconsistent policy has been the bane for India's solar energy sector. Analyze the statement.(250 words)

[Reference](#)

Introduction:

National Solar Mission envisages establishing **India as a global leader in solar energy**. The Mission has set the ambitious target of **deploying 100GW of grid connected solar power by 2022**. (40 GW Rooftop and 60 GW through Large and Medium Scale Grid Connected Solar Power Projects). The country's solar installed capacity reached **28.18 GW on March 31, 2019**.

Body:

Natural advantages of Solar energy in India:

- India has a great potential to generate electricity from solar energy and the Country is on course to emerge as a solar energy hub.
- The techno-commercial potential of photovoltaics in India is enormous. With GDP growing in excess of 8%, the energy 'gap' between supply and demand will only widen. Solar PV is a renewable energy resource capable of bridging this 'gap'.
- Most parts of India have 300 – 330 sunny days in a year, which is equivalent to over 5000 trillion kWh per year – more than India's total energy consumption per year.
- Average solar incidence stands at a robust 4 – 7 kWh/sq. Meter/day.
- About 66 MW of aggregate capacity is installed for various applications comprising one million industrial PV systems – 80% of which is solar lanterns, home/street lighting systems and solar water pumps, etc.
- The estimated potential envisaged by the Ministry for the solar PV programme, i.e. solar street/home lighting systems, solar lanterns is 20 MW/sq. kilometre.
- The potential of the solar thermal sector in India also remains untapped. The Ministry proposes an addition of 500 MW during the phase 1 of JNNSM.
- Establishing manufacturing units at Export Oriented Units, SEZs or under the SIPS programme presents a good opportunity for firms which can leverage India's cost advantage to export solar modules at competitive prices to markets in Europe and the United States.

Achievements:

- National Solar Mission envisages establishing **India as a global leader in solar energy**.
- The Mission has set the ambitious target of **deploying 100GW of grid connected solar power by 2022**. (40 GW Rooftop and 60 GW through Large and Medium Scale Grid Connected Solar Power Projects).
- The country's solar installed capacity reached **21 GW as of 31 December 2018**.
- India along with Paris, on the side-lines of UNFCCC's CoP 21 at Paris (2015) decided to set up **International Solar Alliance**.
- The ISA's major objectives include global deployment of over 1,000GW of solar generation capacity and mobilisation of investment of over US\$ 1000 billion into solar energy by 2030.

Challenges:

- India should have taken a lead in solar panel manufacture to generate solar energy long ago. The share of all manufacturing in GDP was 16% in 1991; it remained the same in 2017.

- Despite the new policy focus on solar plant installation, India is still **not a solar panel manufacturer**.
- India's solar story is largely built over **imported products**. Remaining dependent on imports only leads to short-term benefits for India.
- The Chinese government has subsidised land acquisition, raw material, labour and export, among others. None of this is matched by the Indian government.
- The **cost of debt** in India (11%) is highest in the Asia-Pacific region, while in China it is about 5%.
- India's **domestic content requirement clause** is facing legal challenge at WTO.
- India is facing challenge to balance Prioritising domestic goals and WTO commitments.
- The **dumping of products** is leading to profit erosion of local manufacturers.
- Indian domestic manufacturers aren't **technically and economically strong** to compete with Chinese companies.
- China's strong manufacturing base is giving stiff challenge to domestic manufacturer.
- India's **solar waste** is estimated to be around 1.8 million by 2050 also needs to be tackled.

Way Forward:

- **Flexible financing options** for individuals to install rooftop solar installations would also support a faster adoption of clean energy.
- Strong financial measures are required to finance the solar projects, innovative steps like **green bonds, institutional loans and clean energy fund** can play a crucial role.
- Focus on **last mile connectivity** in remote areas where developing transmission infrastructure is a challenge through **small solar installations or solar community grids** by using a domestically manufactured product with small power inverters or batteries in every home may be helpful to ensure power for all in countries like India.
- This will also help **reduce time and cost** for developing transmission infrastructure.
- **State governments** need to **support semiconductor production** as part of a determined industrial policy to develop this capacity for the future.
- Promotion of research and development in renewable energy sector, especially in storage technology.
- Proper mechanism should be provided to tackle China's dumping of solar equipments.
- Framework to avoid unnecessary delays in policy decision making and implementation.
- India needs a **Solar Waste Management and Manufacturing Standards Policy**.

Discuss major fast-evolving ethical conundrums of biotechnology in detail. (250 words)

[Livemint](https://www.livemint.com)

Why this question:

The article discusses the ethical concerns associated with our capacity to re-engineer the biological world.

Key demand of the question:

Examine the pros and cons associated with the progress and achievements fast being made in the Biotechnology.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:
Introduction:

In brief narrate progress that Biotechnology has made so far.

Body:

Explain that in the information technology world, we have seen an explosion of Artificial Intelligence, automation, blockchains and data science tools in the last few years. All of these technologies, while distinct in their approach, actually cross-pollinate each other.

The world's denizens and their governments have rightly started to worry about issues such as data privacy, control over fiat currencies, job losses and widening income disparities.

Discuss the ethical questions that have arisen.

Conclusion:

Suggest what should be the way forward and how can this conundrum be faced.

Introduction:

Fifteen years after it rose and went limp, the biotech sector, globally, as well as in India has seen a bull run of sorts. In January this year, some 10 healthcare companies went public on the NASDAQ. Meanwhile, India has become the world's 12th biggest biotechnology economy having the second highest number of USFDA-approved plants. Biotechnology will help developing countries accomplish things that they could never do.

Body:

Technology and bioengineering have begun to take over in the life sciences industry. We have already seen ethical questions that arose from a Chinese experiment on interfering with the DNA of babies. Our capacity to re-engineer the biological world is truly mind-boggling in its scope now, and many technological offshoots attempt to fuse man and machine into a cohesive "super-human".

Ethical conundrums posed by biotechnology:

- **Respect:** The issue of how to prioritize the rights of humans, animals and ecosystems. The problems of attuning our ways so that our practices do not harm other living beings
- **Credit:** To ensure our work serves as a resource for the community and the broader public while still valuing those who do the work.
- **community:** To make decisions collectively and identify and engage non-bio stakeholders.
- **Autonomy:** To decide what forms of self-determination we value and identify relationships of power that impact autonomy.
- **Education:** To create space to learn and the confidence to teach.
- **Open science:** To encourage replicability and collaboratively share results? How do we stay open while being mindful of the risks posed by openness?
- **Transparency:** The measures needed to stay open about our failures and acknowledge ethical conflicts. Deciding on what acceptable funding sources are.

- **Data privacy:** To respect the sovereignty of data, treat stakeholders as peers, and agree on terms of use through informed consent.
- **Safety:** How do we embrace safe practices in unconventional contexts? How do we protect each other and create resources for communities to experiment safely?
- **Justice and fairness:** How do we engender justice and fairness in our practices? How can we avoid perpetuating systems of winners and losers? How do we account for the varied impact of our work?
- **Diversity and inclusion:** How do we make sure our organizations respect vulnerabilities and acknowledge privilege? How do we make our spaces valuable and accessible to communities whose interests are historically under-represented in the sciences?
- **Accountability:** Is there an active commitment to consider these questions? How will we be accountable to these ethics? How do we hold each other accountable and make ourselves accountable to those outside this community?

Way Forward:

- India's current regulatory architecture for approving novel treatments is ambiguous and assigns overlapping functions to different governmental bodies. This framework needs to be **restructured to optimize trial approval time while addressing safety requirements**.
- A **two-step model** wherein the **government works with industry and research groups to accelerate clinical research is recommended**. This model consists of a national apex committee working in collaboration with existing institutional ethics committees and independent accreditation agencies.
- It is envisaged that, India will emerge as a significant contributor to the world bioinformatics market and position itself as a global hub for bioinformatics.
- Indian bioinformatics sector has numerous strengths and competitive advantages to make bioinformatics sector a sunrise industry of India.
- With the improvements in the IPR regime, increasing support from the government and continuing efforts of the private sector companies, it is very much likely that India could repeat its IT success story in bioinformatics too.
- Much research on animal models and isolated human cells should be conducted before any full-scale routine application in humans.

Conclusion:

The scientific community and the technology counterpart must begin to consider these questions at the outset, long before we find ourselves overrun by droids and Frankensteins. Experiments and tests to validate the use of new discoveries must be subjected to appropriate scrutiny by the regulators, and their use must be controlled to prevent commercial misuse.

What is preventive precision medicine? Discuss in what way it can help India address inequities in healthcare system.(250 words)

Livemint

Why this question:

The article discusses the relevance of mapping genes to the Indian healthcare system.

Key demand of the question:

One must explain the concept of preventive precision medicine and its utility to Indian healthcare system.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:
Introduction:

In brief narrate the concept of precision medicine.

Body:

Discuss the concept – It is an emerging approach for disease treatment and prevention that takes into account individual variability in genes, environment, and lifestyle for each person.

Take hints from the article and explain in what way can help and aid the health system of India.

Quote examples to signify the utility of such an idea.

Conclusion:

Conclude with its relevance to Indian health system.

Introduction:

Preventive Precision medicine is “an emerging approach for disease treatment and prevention that takes into account individual variability in genes, environment, and lifestyle for each person.” This approach will allow doctors and researchers to predict more accurately which treatment and prevention strategies for a particular disease will work in which groups of people.

Body:
Precision medicine:

- It is about devising a tailor-made treatment process for each patient with detailed specifics for the right drugs, doses, medication timing and course duration, by capturing data about his or her genetic coding, environment and lifestyle.
- Laying the groundwork for a participatory, predictive and preventive healthcare service delivery system, it offers an effective and scalable solution to today’s healthcare problems.
- Precision medicine focuses on specific treatments by getting to the root of the illness.
- This approach will allow doctors and researchers to predict more accurately which treatment and prevention strategies for a particular disease will work in which groups of people.
- It is in contrast to a one-size-fits-all approach, in which disease treatment and prevention strategies are developed for the average person, with less consideration for the differences between individuals.

IndiGen benefits for precision medicine:

- The whole genome data will be important for building the knowhow, baseline data and indigenous capacity in the emerging area of Precision Medicine.
- The benefits include epidemiology of genetic diseases to enable cost effective genetic tests, carrier screening applications for expectant couples, enabling efficient diagnosis of heritable cancers and pharmacogenetic tests to prevent adverse drug reactions.

- The outcomes will have applications in a number of areas including predictive and preventive medicine with faster and efficient diagnosis of rare genetic diseases.
- The outcomes will be utilized towards understanding the genetic diversity on a population scale, make available genetic variant frequencies for clinical applications and enable genetic epidemiology of diseases.

Preventive Precision Medicine can help address inequities:

- Preventive precision medicine of this kind can help address inequities in how healthcare is financed.
- The combined government expenditure on healthcare was around 1.4% of India's gross domestic product (GDP) in 2017-18.
- Private expenditure is three times as much, which means individuals and families bear an overwhelming share of the costs.
- By some estimates, as many as 39 million people are pushed into poverty by healthcare expenses.
- Given such a pattern, making information about potential health risks available, raising awareness and providing counselling services can help reduce the incidence of many diseases.

Conclusion:

If the Indian government creates a national genomic platform now, it would serve as inclusive health infrastructure and enable future generations to lead much healthier lives, without having to suffer debilitating financial burdens.

While ISRO's credentials as a poster child for India's technological abilities have been fortified, it still has a long way to go in terms of its reputation as an enabler of local business. Discuss. (250 words)

[The hindu](#)

Why this question:

The Indian Space Research Organization's successful launch on Wednesday of Cartosat-3, along with 13 other small U.S. satellites, marks a major technological milestone for India.

Key demand of the question:

One must analyse the future of ISRO owing to aspects of commercialisation.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief narrate the achievements of ISRO.

Body:

Explain that While satellite launches make for a good spectacle, they are meaningful only in so far as they aid commerce and generate revenue and jobs. Indian regulations restrict access to satellite images sharper than one meter to the government. Other than for transponders, there is a long way to go for Indian private companies sending innovative payloads aboard ISRO launch vehicles. ISRO recently launched a company called New Space India Limited (NSIL), a competitor to Antrix, but like

it, is another public enterprise meant to commercialize space products and satellite development deals with private entities.

Conclusion:

Conclude with what needs to be done and suggest way forward.

Introduction:

The Indian Space Research Organisation's recently launched successfully Cartosat-3, along with 13 other small U.S. satellites. This marks a major technological milestone for India as Cartosat-3, as a commercial spacecraft, creates a wealth of applications. However, it is ironic that India—whose space-faring tradition is decidedly in the service of human development—is lagging in harnessing the power of private innovation in the space domain. This not only limits the exploitation of space for economic development, but has serious national security implications.

Body:

Applications of Cartosat-3:

- Cartosat-3 is capable of unprecedented image resolution of nearly 25 cm on the ground as against the best global military-grade satellites that can provide a 10 cm resolution.
- The best satellite images commercially available are between 25-30 cm.
- Military espionage is the lowest hanging fruit.
- It is believed that surveillance by the earlier Cartosat-2 satellite series — with a resolution, though coarser, of about 65 cm — was used to plan and execute military operations such as 'surgical strikes' across the Line of Control in 2016 and the Manipur-Myanmar border in 2015.
- For the government, such resolution can help monitor progress of road construction, coastal land-erosion, forest conservation, oceanic changes and infrastructure development.

Challenges faced:

- **Processing Issues:**
 - Image resolution is good to have but secondary to image processing.
 - That means unless and until there is sophisticated technology available to analyse the generated images, it will forever be inferior, and less valued, than coarser images scanned by better processing-software
- **Legal Issues:**
 - Indian regulations restrict access to satellite images sharper than one metre to the government.
- **Technical Issues:**
 - ISRO's key capability still lies in developing and launching small- and medium-sized satellites. There is a need to explore bigger sized satellites

Challenges for private space entities in India:

- **Monopoly:** In India 'Space' means Indian Space Research Organisation. Globally the technology is highly protected because of its dual use capability. Even if it was not, it would be prohibitively expensive.
- **Funding:** A major challenge in setting up a space business in India is funding. Space industry is capital intensive and upstream activities come with a long gestation period.
- **Investor's Dilemma:** The lack of clarity among the investors and lack of the ecosystem required for significant contribution is a challenge for the investors.
- **Lack of Regulation:** India is a party to the **Outer Space Treaty**, where one of the fundamental requirements laid upon states is the supervision of space activities within its borders, the country did not have any formally legislated laws. This is a potential roadblock for commercialization.
- **Growth Challenges:** Scaling up, international marketing and funding are challenges.
- **Lack of Support:** The Indian ecosystem has neither incubation support nor pointers to seek support of leaders such as ISRO for space start-ups.
- **Political and bureaucratic hurdles** limit private space operations in India.
- Low in-house capacity of ISRO restricts them to very few launches in a year. Privatization can offload 30-40% of the work and help them work more efficiently.

Way forward:

- India should have **national space activities legislation** which takes on board all stakeholders.
- A **public-private partnership (PPP) model** can be looked into to realise ISRO's workhorse Polar Satellite Launch Vehicle (PSLV), with a joint venture between ISRO and the private sector.
- In the UK, space ventures are treated as a complement to big organizations and not a competitor. This should be encouraged in India too.
- A **supportive international partner and likeminded local partners** helps to set up a space business.
- The idea should be to let the private industry build their own facilities after gaining enough expertise.
- ISRO has built a space technology park spread over 25 acres in Bengaluru where the entire range of facilities have been set up for use by the industry.

Conclusion:

The private sector already supplies majority of the sub-systems in satellite manufacturing. This can be further scaled up into other activities with proper regulation and partnership of the ISRO and private sector. The country must deregulate the space sector to encourage private enterprise if we are to compete in the new space economy.

Awareness in the fields of IT, Space, Computers, robotics, nano-technology, bio-technology and issues relating to intellectual property rights.

What are Spywares? Discuss the problems created by 'Pegasus' spyware in snooping the phones of Indian users recently and also discuss the ways to tackle the same. (250 words)

The hindu

Why this question:

The question is amidst the incidence of the Govt. questioning WhatsApp after spyware was detected for alleged snooping of Indians.

Key demand of the question:

The Centre has sought an explanation from messaging platform WhatsApp after the Facebook-owned company confirmed that some Indian users of its app came under surveillance using an Israeli spyware. One has to explain what are spywares and how should they be handled as a cyber-security threat.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief narrate the recent attack by the spyware.

Body:

Explain the recent incidence of spyware Pegasus.

Discuss the threats such cyber-attacks pose to the national security of the country.

What issues do they pose with respect to privacy safeguards?

Explain the associated risk factors in detail and methods to tackle them.

Conclusion:

Conclude with way forward.

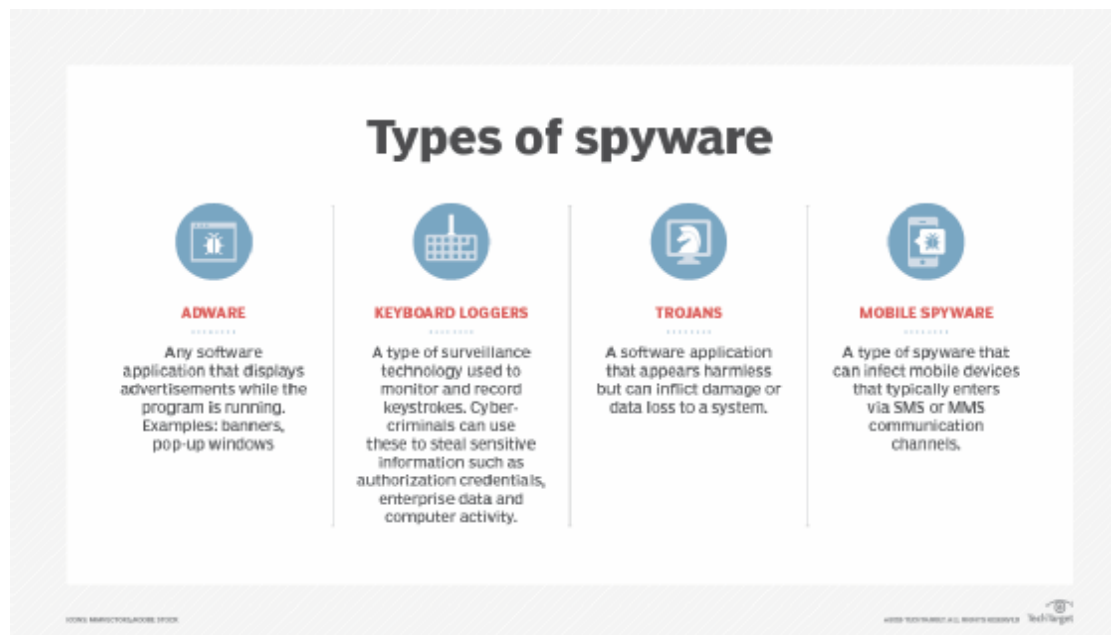

Introduction:

Spyware is software that is installed on a computing device without the end user's knowledge. Any software can be classified as spyware if it is downloaded without the user's authorization. Spyware is controversial because even when it is installed for relatively innocuous reasons, it can violate the end user's privacy and has the potential to be abused.

WhatsApp sued an Israeli firm, the NSO Group in a court for using its platform to spy on journalists and human rights activists worldwide. The surveillance was carried out using a spyware tool called Pegasus, which has been developed by the NSO Group.

Body:

Spyware can be difficult to detect; often, the first indication a user has that a computing device has been infected with spyware is a noticeable reduction in processor or network connection speeds and in the case of mobile devices — data usage and battery life.

Pegasus is spyware that can be installed on mobile devices. It is regarded as one of the “most sophisticated” smartphone spyware. In May 2019, the Pegasus was being used to exploit WhatsApp and spy on potential targets. The spyware named ‘Pegasus’ is developed by the Israeli cyber arms firm NSO in 2016.

Working of Pegasus:

- Pegasus exploited a weakness in WhatsApp’s video-call feature that allowed attackers to inject the spyware on to phones simply by ringing the number of targets’ device. It enters the phone even if the call is not answered.
- Once Pegasus is installed, it can access the targeted users’ private data, including passwords, contact lists, calendar events, text messages, and live voice calls from popular mobile messaging apps.
- It can work on BlackBerry, Android, iOS and Symbian-based devices.

- It can send back the target's private data, including passwords, messages, live voice calls, etc., from popular mobile messaging apps.
- The target's phone camera and microphone can be turned on to capture all activity in the phone's vicinity, expanding the scope of the surveillance.
- Pegasus has the ability to access password-protected devices, being totally transparent to the target, leaving no trace on the device without arousing suspicion in more alert users.
- It has a self-destruct mechanism in case of risk of exposure, and ability to retrieve any file for deeper analysis.

Measures to tackle spywares:

- **Regular Data Backup:** This helps restore the last saved data and minimise data loss. Ransomware also attacks servers; hence it is important to have a backup on a disconnected hard drive or external device on the pre-defined regular basis.
- To prevent infiltration of malware, having password protected tools to identify and filter certain file extensions like ".exe" or ". Zip", are essential. Emails that appear suspicious should also be filtered at the exchange level.
- **User awareness:** Awareness among users needs to be created to avoid opening the unsolicited attachment. Malware is typically designed to mimic identities of people that users interact with on a regular basis either on a personal or professional level.
- **Regular patch and upgrades:** To prevent leaks or vulnerabilities in software, ensure to regularly update the software versions and apply patches released by the vendor. These patches and version are often released to wrestle with known or newly discovered exploits and can prevent known signatures of these malware, Trojans or ransomware to enter the system.
- **Install and run anti-malware and firewall software.** When selecting software, choose a program that offers tools for detecting, quarantining, and removing multiple types of malware.
- The combination of anti-malware software and a firewall will ensure that all incoming and existing data gets scanned for malware and that malware can be safely removed once detected.
- Keep software and operating systems up to date with current vulnerability patches. These patches are often released to patch bugs or other security flaws that could be exploited by attackers.
- Be vigilant when downloading files, programs, attachments, etc. Downloads that seem strange or are from an unfamiliar source often contain malware.

Conclusion:

The Government of India has come up with initiatives like National Cybersecurity policy 2013, CERT-In, Cyber Swachhata Kendra to fight against such cyber threats. Cybersecurity becomes imperative in the wake of Government's push for Digital India.

Explain what is 'IndiGen' project? Discuss how CSIR's 'IndiGen' project will lead to precision medicine and develop its commercial gene testing services? (250 words).

The hindu

Why this question:

The Council of Scientific and Industrial Research (CSIR) recently announced the conclusion of a six-month exercise (from April 2019) of conducting a "whole-genome sequence" of a 1,008 Indians.

Key demand of the question:

The question is straightforward; one must explain the concept of what is 'IndiGen' project and in what way it will help in precision medicine and commercial gene testing services.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In brief explain the context of the question.

Body:

Explain first what is whole genome sequencing?

Discuss How the CSIR enterprise work on the project – Under "IndiGen", the CSIR drafted about 1,000 youth from across India by organizing camps in several colleges and educating attendees on genomics and the role of genes in disease. Some students and participants donated blood samples from where their DNA sequences were collected.

Explain the challenges involved.

Conclusion:

Conclude with significance of such a project.

Introduction:

The **Council of Scientific and Industrial Research (CSIR)** recently announced the conclusion of a six-month exercise (from April 2019) of conducting a "whole-genome sequence" of a 1,008 Indians. The project is part of a programme called "IndiGen" and is also seen as a precursor to a much larger exercise involving other government departments to map a larger swathe of the population in the country.

Body:

IndiGen project:

- The aim of the exercise was twofold:
 - To test if it's possible to rapidly and reliably scan several genomes and advise people on health risks that are manifest in their gene
 - Understand the variation and frequency of certain genes that are known to be linked to disease.
- The project is an adjunct to a much larger government-led program, still in the works, to sequence at least 10,000 Indian genomes.
- Typically, those recruited as part of genome-sample collections are representative of the country's population diversity. In this case, the bulk of them will be college students, both men and women, and pursuing degrees in the life sciences or biology.

- The project aims to reach out to a lot of collegians, educating them about genomics and putting a system in place that allows them to access information revealed by their genome.

Methodology:

- Genomes will be sequenced based on a blood sample and the scientists plan to hold at least 30 camps covering most States.
- **Genome sequencing** is the process of determining the complete DNA sequence of an organism's genome at a single time. This entails sequencing all of an organism's chromosomal DNA as well as DNA contained in the mitochondria (and, for plants, in the chloroplast).
- Every person whose genomes are sequenced will be given a report.
- The participants would be told if they carry gene variants that make them less responsive to certain classes of medicines.
- For instance, having a certain gene makes some people less responsive to clopidogrel, a key drug that prevents strokes and heart attacks.

IndiGen benefits for precision medicine:

- The whole genome data will be important for building the knowhow, baseline data and indigenous capacity in the emerging area of Precision Medicine.
- The benefits include epidemiology of genetic diseases to enable cost effective genetic tests, carrier screening applications for expectant couples, enabling efficient diagnosis of heritable cancers and pharmacogenetic tests to prevent adverse drug reactions.
- The outcomes will have applications in a number of areas including predictive and preventive medicine with faster and efficient diagnosis of rare genetic diseases.
- The outcomes will be utilized towards understanding the genetic diversity on a population scale, make available genetic variant frequencies for clinical applications and enable genetic epidemiology of diseases.

Conclusion:

The CSIR exercise ties into a larger program coordinated by the Department of Biotechnology, which plans to scan nearly 20,000 Indian genomes over the next five years, in a two-phase exercise, and develop diagnostic tests that can be used to test for cancer.

“Conservation of plant genetic resources is the shared responsibility of humanity”, do you agree with the statement? Discuss and give your opinion with suitable justifications. (250 words)

Reference

Why this question:

Union Agriculture Minister Shri Narendra Singh Tomar attended the 8 Governing Body of International Treaty of Plant Genetic Resources for Food and Agriculture (ITPGRFA) in Rome, Italy. Thus the question from the perspective of GS paper III.

Key demand of the question:

Explain the significance of Conservation of plant genetic resources and discuss in what way it is the shared responsibility of humanity.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief suggest that farming is the backbone of the socio-economy of India, where crop biodiversity is part and parcel of life.

Body:

Explain first the significance of plant genetic resources in general.

Briefly highlight the diversity of plant genetic resources present in the country (provide for some statistics and draw map of India and show depictions for the same).

Then explain in detail why conservation of plant genetic resources is the shared responsibility of humanity.

Conclusion:

Conclude with way forward.

Introduction:

The eighth session of the Governing Body of **International Treaty of Plant Genetic Resources for Food and Agriculture (ITPGRFA)** is being held in Rome, Italy from 11th to 16th November 2019. The Indian Agricultural Minister highlighted the **need for conservation of plant genetic resources** and the uniqueness of Indian Legislation **Protection of Plant Varieties and Farmers' Rights (PPV&FR) Act** to address the related issues. In April 2019, PepsiCo filed a suit against Gujarati farmers by invoking the provisions of the act.

Body:

ITPGRFA also known as Seed Treaty, is a comprehensive international agreement for ensuring food security through the conservation, exchange and sustainable use of the world's plant genetic resources for food and agriculture (PGRFA), as well as the fair and equitable benefit sharing arising from its use. It also recognizes farmers' rights, subject to national laws.

Need for Conservation of plant genetic resources (PGR):

- Plant genetic resources (PGR) are the basic materials that are essential for development of improved crop varieties designed to combine high yield potential with superior quality, resistance to diseases and pests, and also better adaptation. to abiotic stress environments.
- Their continued availability to plant breeders is necessary not only for sustaining advances in crop productivity but also for stabilising production in the country.
- These resources of known or potential use to man constitute a broad spectrum of diverse gene pools representing assemblage of landraces, primitive cultivars, varieties of traditional agriculture as well as wild and weedy relatives of crop plants.
- Recent years have seen an increasing global concern over the loss of genetic resources of crop plants.
- Future progress in crop improvement and our food security depends, to a great extent, on immediate conservation of the rapidly vanishing crop gene resources and their effective utilisation by plant breeders.

- Conserving PGR helps in **maintenance of broad based genetic diversity within each of the species** (i.e., intra-specific genetic diversity) with a known or potential value in order to ensure availability for exploitation by present and future generations.
- Conserving PGR **ensures the future adaptability of cultivars and wild populations**.
- It **preserves data and traits that ensure sustainable agriculture**.
- It **promotes the use of genetic resources in commerce and biotechnology**.
- **Conserves genetic diversity for cultural reasons**.

Indian initiatives for preserving PGR:

- ICAR-National Bureau of Plant Genetic Resources (NBPGR), New Delhi is conserving seed germplasm for long-term conservation (at -20°C) in its National Genebank (NGB).
- NGB has the responsibility of conservation of plant genetic resources for posterity and sustainable use including landraces and traditional varieties which are potential sources of agriculturally important genes.
- At Chang La in the Himalayas, at a height of 17,300 feet, there is a storage facility with over 5,000 seed accessions.
- The vault is a joint venture of the National Bureau of Plant Genetic Resources (under ICAR) and the Defence Institute of High Altitude Research (under DRDO).
- The Govt. of India enacted "The Protection of Plant Varieties and Farmers' Rights (PPV&FR) Act, 2001" adopting sui generis system.

Way forward:

- An understanding of the extent and distribution of diversity in species and ecosystems is pertinent and this can be achieved through efficient survey, inventory, appropriate research, field studies and analysis.
- Sustainable agriculture should be promoted through diversification of crop production and development and commercialization of under-utilized crops and species.
- On-farm management and improvement of plant genetic resources should be supported and this will require integrated approaches combining the best of traditional knowledge and modern technologies.
- More natural reserved areas should be created and those existing should be properly managed, financially supported and an effective enforcement of laws should guard them.
- It is important that this diversity be made more useful and valuable to breeders, farmers, and indigenous and local communities, by providing better and more accessible documentation.
- Public awareness of the value of plant genetic resources through training, seminar and the media should be promoted.

Conclusion:

There is increasing global awareness of the need for conserving genetic resources of crop plants for their current use and for posterity. Future development in the improvement of crops largely hinge on immediate conservation of genetic resources for their effective and sustainable utilization. A vast amount of plant genetic resources are threatened, endangered and some have even gone extinct and it is more prominent in recent times, mostly due to genetic erosion and environmental transformation by anthropogenic effect. In order to meet current global challenges all countries and institutions must as a matter of primary obligation discover, collect and conserve valuable and potentially valuable plant genetic resource and utilize it sustainably.

Internet diffusion can act as a multiplier effect on empowerment of human beings and also for country's growth. Examine the statement in the context of India's digital advancement with suitable best practices. (250 words)

The hindu

Why this question:

The question seeks to examine the multiplier effect that the internet penetration in the country has on the demography.

Key demand of the question:

Explain the multiplier effect in detail, discuss the effect with examples and explain its contributions in different sectors.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief explain the current diffusion of internet in the country.

Body:

Give a brief introduction about the status of digital penetration in India and the importance of it.

Explain the reasons for low penetration and the gap existing between men and women, villages and towns etc.

Suggest steps to be taken in this regard.

Explain the benefits and disadvantages associated.

Conclusion:

Conclude with way ahead.

Introduction:

Internet as part of the history is the most important invention around the world which connects people through phones, satellites and cables. People all over the world have access to it as it is everyday usage, and internet becomes globally real and in demand. The maximum effect of the internet is actually on the daily life of the individuals because indeed there is no aspect of life which is not influenced by the internet and its uses.

Body:

Internet penetration has had a multiplier effect:

- Information technologies have wrought fundamental change throughout society, driving it forward from the industrial age to the networked era. In our world, **global information networks are vital infrastructure.**

- The Internet has changed business, education, government, healthcare, and even the ways in which we interact with our loved ones—it has become one of **the key drivers of social evolution**.
- Online, the conventional constraints of space and time disappear and there is a dizzyingly wide range of communicative possibilities. The impact of social media applications has triggered discussion of the **“new communication democracy.”**
- The **right utilization of Internet power is challenging for governments across the world**. Government expenses are reduced due to providing data and information for people on the government websites. People are taking advantages of Government policies and websites. Any government information and service are easily accessible for the citizens. Using tools such as Right to Information, we can have online access to important government documents.
- The Internet is one of the key factors **driving today’s economy**. Even in a tough macroeconomic framework, the Internet can foster growth, coupled with enhanced productivity and competitiveness.
- The Internet has clearly **impacted all levels of education** by providing unbounded possibilities for learning. I believe the future of education is a networked future. People can use the Internet to create and share knowledge and develop new ways of teaching and learning that captivate and stimulate students’ imagination at anytime, anywhere, using any device.
- The most interesting aspect of the internet influencing our daily lives is the factor of **entertainment**. Entertainment no longer demands your money or expense, today you can just log on the internet in your free time and get involved talking to people of similar interests, or watch movies or play games, it’s all there in the internet.
- The development of information and communication technologies and the wide-ranging effects of globalization are changing what we are, and the meaning of cultural identity. The concepts of space, time, and distance are losing their conventional meanings. **Cultural globalization** is here, and a global movement of cultural processes and initiatives is underway.
- The Internet revolution is not just technological; it also **operates at a personal level**, and throughout the structure of society. The Internet makes it possible for an unlimited number of people to communicate with one another freely and easily, in an unrestricted way.

However, it has its share of problems:

- A key issue surrounding Internet use is **privacy**. Internet users are becoming more sensitive to the insight that privacy is a must-have in our lives. It’s very tough even for the government of various countries to protect user’s privacy.
- The biggest challenge for the society to do mobile banking and cashless transactions. Because the **data is compromised** by such companies and there is no guarantee that you’re safe or not.
- Much of the time, people started to use social media with no real idea of the dangers, and have wised up only through trial and error—sheer accident, snafus, and mistakes. Lately, inappropriate use of social media seems to hit the headlines every day

- Internet has given rise to **cybercrime** of which mostly teenagers and youngsters become the victim. We all hear in our day to day life about these cases for eg. Leaking someone's private clips or pictures on internet just for the sake of jealousy or taking revenge or for hacking.
- The Internet is **creating robotic societies**. A society with hybrid skills doing like, comments but doesn't have feelings and own impact on his/her social shares.
- The Internet is also helping the polarization of the society by dividing the unity of people by **producing communalism and casteism material on the internet**. Producers of communalism and casteism in the society never develop the society.
- If technology can replace a task, we will rely on it rather than exercise our mental faculties. So, the tech giants will give birth to a "reliance economy".

Conclusion:

Today almost all the things are connected and working through the Internet. There should be no doubt that Internet is becoming the engine of every new invention. No matter how bad society is influenced by the internet, but education of people can play a role in right usage of Internet. The role is not defined by algorithms, it is defined by our parents, teachers and after self-analysis.

Conservation, environmental pollution and degradation, environmental impact assessment

Do you think mere amendment of Air (Prevention and Control of Pollution) act, 1981 will aid the fight against pollution in the country? Critically analyse.(250 words)

[Indianexpress](https://www.indianexpress.com)

Why this question:

The article explains that amending and updating the 1981 Air Act will help in the battle against pollution.

Key demand of the question:

One has to explain that Air pollution in India is not simply an environmental problem, but a major public health concern. It impacts all those breathing in the polluted air — children, the elderly, women and men alike. As its concentration worsens in India and statistics grow grimmer, so do our policymakers' reactions.

Directive:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgment.

Structure of the answer:

Introduction:

In brief set the context of the question by highlighting the air pollution concerns being witnessed in the capital.

Body:

Explain that Statistics show that India is in a worse situation compared to its global counterparts. According to Greenpeace, 22 of the world's 30 most polluted cities are in India and Delhi has yet again bagged the position of the world's most polluted capital. These are grim figures, especially when compared to India's neighbours: Five in China, two in Pakistan and one in Bangladesh. In 2018, India was placed in the bottom five countries on the Environmental Performance Index, ranking

177th out of 180 countries, along with Bangladesh, Burundi, Democratic Republic of Congo, and Nepal.

Then explain what the root causes of the situation are.

Discuss most importantly significance of amending the air pollution act.

Conclusion:

Conclude with way ahead.

Introduction:

The Air Quality Index in Delhi has crossed 500, the national capital has officially entered the public health emergency category. Schools have been shut, children are complaining of breathing problems. The state and Central governments are simply indulging in blame-games. This forms the basis of the need for amending the 1981 Air Act and making it more compatible with contemporary India.

Body:

India's air pollution scenario:

- Statistics show that India is in a worse situation compared to its global counterparts.
- According to Greenpeace, 22 of the world's 30 most polluted cities are in India and Delhi has yet again bagged the position of the world's most polluted capital.
- These are grim figures, especially when compared to India's neighbours: Five in China, two in Pakistan and one in Bangladesh. In 2018, India was placed in the bottom five countries on the Environmental Performance Index, ranking 177th out of 180 countries, along with Bangladesh, Burundi, Democratic Republic of Congo, and Nepal.
- Air pollution in India is not simply an environmental problem, but a major public health concern.
- It impacts all those breathing in the polluted air — children, the elderly, women and men alike.
- Recently, the Centre for Science and Environment reported that air pollution kills an average 8.5 out of every 10,000 children in India before they turn five.
- Similarly, the WHO in 2016 reported that pollution has led to the deaths of over 1 lakh children in India.
- Overall, several internationally acclaimed studies have affirmed that life expectancy in India has declined anywhere between two to three years.

A strong legislation will help curb air pollution:

- The Indian government needs to identify the tangible benefits that concrete legislation on air pollution has brought across the world.
- In the United States, the Clean Air Act has proven that public health and economic progress can go together.
- For instance, the aggregate national emissions of the six common pollutants in the USA dropped an average of 73 per cent from 1970 to 2017.

- Through one piece of legislation, the US has challenged multiple sources of pollution, airborne or motor vehicle-led.
- Similarly, after declaring a war on pollution, Chinese cities reduced particulate concentration by 32 per cent in 2018.
- In a country with a human power and technical know-how like India, achieving a better feat is not impossible.
- In recent times, the government has worked on a much hyped “mission-mode” — drafting policies and programmes to alleviate pollution.
- But with little to no legal mandate or a budgetary allocation of as little as Rs 300 crore under programmes such as the National Clean Air Programme, no true enforcement of targets and goals is guaranteed.
- In such dire circumstances with high stakes, higher targets need to be set, penalties need to be stricter, and the mandate needs to be stronger.

Need for amendment of Air Pollution Act:

- There is unanimous consensus amongst many court rulings, Parliament Committee reports, media investigations, and several environmentalists that under the 1981 Air Act, the Pollution Control Boards are presently unable to fulfil their mandate as watchdogs against polluting industries.
- A new bill will plug many loopholes in the 1981 Act and would align the functions and priorities of the Pollution Boards towards reducing the adverse impact of pollution on human health in India.
- India’s pollution liability regime has never prioritised the adverse impact of pollution on health.
- In its present form, India’s Air Act does not mention or prioritise the importance of reducing the health impact of rising pollution.
- This is the first change that a new law on air pollution should bring, protecting health needs to become the central mission that the boards work towards.
- For instance, at any point that the State Boards find evidence of excess air pollution, they should take all measures possible to actively disseminate this information to the masses.
- When the air quality goes from normal to toxic and hazardous, the boards must be empowered to declare public health emergencies, with the power to temporarily shut down all polluting activities.
- While these changes might introduce an additional burden on industries to proactively check their emissions, the additional burden is worth the lives that will be saved as a result.

Need for other actions along with Air Pollution Act:

- It is caused by emissions from vehicles, industries and agriculture, construction dust, and other factors related to household consumption and municipal planning.

- The new law must push Central and state boards to convene joint sittings with a multi-sectoral participation from ministries such as housing, urban development, agriculture and road transport.
- Pollution control boards must be empowered sufficiently to ensure that pollution does not take more lives or hinders the overall progress of India.
- To incentivise the industries to better themselves through environmental compensations, the industries and their respective state boards must be ranked in order of their efficiency and programme delivery.
- The new law on air pollution must give an additional mandate to either a senior minister, such as the minister of environment, forest and climate or the prime minister's office needs to be involved directly.
- Greater public transparency is essential to the success of winning the war on air pollution.

Conclusion:

Breathing clean air is the fundamental right of every Indian citizen. Human health must become a priority when it comes to legislating on air pollution.

The pollution problem in NCR is more complex than it seems on the outside. Critically Analyse. (250 words)

Livemint

Why this question:

Beginning Monday, the odd-even scheme for automobiles plying in Delhi will kick in. Coincidentally, the weekend preceding it saw a steep deterioration in the air quality index or AQI in the city; forcing Environmental Pollution (Prevention and Control) Authority (EPCA) to declare a public health emergency on Friday as a desperate measure to contain the silent killer.

Key demand of the question:

One must bring out the concerns of air pollution problem facing the capital and provide for a critical analysis of what needs to be done to contain the situation.

Directive:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgment.

Structure of the answer:

Introduction:

In brief narrate scenario in the capital with respect to pollution problem.

Body:

Explain the problem in detail – The NCR pollution problem is partly because of the nature of its topography.

Suggest solutions to the issue – Experts have long been making a case for public transport. The assumption among policy planners is that the Metro Rail, has been critical in addressing transport woes of NCR's working population, especially women and is the best solution.

Conclusion:

The only freebie that matters is clear air; and our politicians who always aver the cause of the poor should remember that like income inequality pollution is hardest on those at the bottom of the pyramid.

Introduction:

Delhi Chief Minister tweeted that the city 'has become a gas chamber'. If serious steps are not taken, Delhi may soon face an "air pollution disaster" which London saw 65 years ago. The odd-even scheme for automobiles plying in Delhi has kicked in. Coincidentally, the weekend preceding it saw a steep deterioration in the air quality index or AQI in the city; forcing Environmental Pollution (Prevention and Control) Authority (EPCA) to declare a public health emergency on Friday as a desperate measure to contain the silent killer.

Body:

Air pollution in NCR is due to

Natural factors:

- Low temperature in winter leads to low wind velocity, which reduces the dust dispersal process
- Landlocked cities, no moderate sea effect

Anthropogenic factors:

- **Vehicular emissions:** Increased number of diesel vehicles, huge commuters, absence of integrated transport public infrastructure adds the problem
- The extreme use of crackers during the celebrations has raised the level of pollution in the city.
- **Road dust:** Dust emanating from unpaved roads and peak construction activities causes silicosis.
- **Construction activities:**
- **Industrial vehicles:** Dirty power plants, coal usage in hotels, diesel generators contributes SO₂ and NO_x which can cause major respiratory ailments
- **Waste burning:** Crop residue (stubble) burning in neighbouring states – Punjab, Haryana, Uttar Pradesh transfers pollutants to Delhi.
- **Improper waste management:** Burning of waste at landfills and lack of waste segregation at source adds particulate matter into the atmosphere

Consequences:

- As the Air Quality Index increases, large percentage of the population is likely to experience severe adverse health effects.
- The alarming level of pollution in the city is detrimental for not only people suffering from respiratory illnesses but also for the normal population.
- There is an increase in the number of people who get a recurrent irritative cough, recurrent episodes of sinusitis and more frequent attacks of asthma and chronic obstructive pulmonary disease (COPD)
- Apart from smoke, crackers also release toxic metals in environment which are going to come back to use through food chain.

- According to a new report from UNICEF, about a third of the 2 billion children in the world, who are breathing toxic air, live in northern India risking serious health effects including damage to their lungs, brains and other organs.
- The value of work time lost due to the illness by the patient or the caregiver, or both
- Exposure to vehicular emission or air pollution result in a greatly increased probability of lung cancer

Measures needed:

- Create awareness among the masses by installing LED panels displaying pollution levels
- Preventive measures like hike in parking fees and slashing of metro fares.
- Need for implementing long-term measures as the use of nasal filters or air purifiers can provide short-term relief only.
- Residents must avoid stepping out or doing outdoor activities during the early morning and evening hours.
- Doctors must address school children about air pollution and its hazards.
- CPCB should direct local bodies to check open burning of solid waste and strictly enforce rules related to prevention of emission from construction activities.
- Mechanical sweeping with water wash and vacuum-assisted sweeping of roads to reduce road dust emission.
- There is great potential for making investments in paddy straw-based power plants which can help avoid stubble burning and create employment opportunities.
- The efforts of the MoEFCC, ministry of power, MNRE, MoRTH, MoHUA, MOHFW and a variety of non-governmental partners must come together for dealing with air pollution
- There must be political will for political parties and governments to firstly acknowledge the scale of this health emergency and then work together
- To regulate automobiles –stringent measures are needed. For example, Singapore has decided to stop registration of all new vehicles.

Conclusion:

The only freebie that matters is clear air; and our politicians who always aver the cause of the poor should remember that like income inequality pollution is hardest on those at the bottom of the pyramid.

What do you understand by Chhattisgarh model for disposal of agri-waste? Explain how it offers a solution to the pollution crisis.(250 words)

[Indianexpress](#)

Why this question:

The article explains in what way Chhattisgarh model for disposal of agri-waste offers a solution to pollution crisis.

Key demand of the question:

Explain what is Chhattisgarh model for disposal of agri-waste and in what way it offers a solution to pollution crisis.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In brief highlight the pollution caused owing to stubble burning across the Northern India.

Body:

First discuss what is the Chhattisgarh model for mitigating the harmful effects of stubble burning. Chhattisgarh has undertaken an innovative experiment by setting up gauthans. A gauthan is a dedicated five-acre plot, held in common by each village, where all the unused parali (pairain Chhattisgarhi) is collected through parali daan (people's donations) and is converted into organic fertiliser by rural youth. This provides them a living.

Discuss the benefits of such a process/model.

Conclusion:

Conclude with a positive note that it is a good step forward in mitigating the effects of stubble burning that has led to huge climate crisis in the country.

Introduction:

The pollution caused by burning of Parali (stubble or crop residue) is a unprecedented crisis which has held New Delhi and its citizens to a ransom. The agri-waste burning has not only choked Delhi or there is a 50 per cent rise in respiratory illnesses, be it COPD or asthma cases, in the National Capital Region (NCR) area, but also there is a loss of soil fertility and there is a rise in incidents of cancer in Punjab and Haryana. **Parali can be mixed with cow dung and few natural enzymes under MGNREGA to generate high-grade compost, and also reduce air pollution in North India.**

Body:

Air pollution crisis in NCR:

- Farmers in Haryana and Punjab burn up to 35 million tonnes of parali, which is responsible for significant percentage of Delhi-NCR's air pollution levels.
- One study estimates that crop residue burning released 149 million tonnes of carbon dioxide, nine million tonnes of carbon monoxide, 0.25 million tonnes of sulphur oxides and 1.28 million tonnes of particulate matter.

Chhattisgarh model for disposal of agri-waste:

- In Chhattisgarh, we have already undertaken this innovative experiment by setting up **gauthans**.
- A **gauthan** is a dedicated five-acre plot, held in common by each village, where all the unused parali (paira in Chhattisgarhi) is collected through parali daan (people's donations) and is converted into organic fertiliser by rural youth.
- This provides them a living.
- It involves an integrated regenerative rural development model **of narwa (rivulet regeneration), garuwa (cattle conservation), ghuruwa (composting) and baari (kitchen garden)** through a participatory process using MGNREGA.

- **Role of state Government in the initiative:**

- Farmers cannot do this alone as it involves capital expenditure.
- In Chhattisgarh, the government supports only the transportation of parali from the farm to the nearest gauthan.
- The state has successfully developed 2,000 gauthans.

Importance of recycling in Agriculture:

- Agriculture is a regenerative process, one which recycles.
- What we need is to utilise every product in the process and return it to the soil in one form or another.
- From 35 million tonnes of parali, we can obtain 21 million tonnes of high-grade organic fertiliser.
- The total amount of nitrogen, phosphorous, potassium and sulphur in the 23 million tonnes of parali annually burnt in Northwest India is about seven lakh tonnes, valued at Rs 1,000 crore.
- This apart, organic carbon is also destroyed during stubble burning.
- Thus, parali offers an important source for meeting the nutrient requirements of crops and improving soil health.
- These nutrients also reduce the risk of cancers in Punjab by reducing the levels of carcinogens in soil.

Way forward:

- Supreme Court could constitute a committee consisting of economists, agricultural experts, farmer delegates and bureaucrats to evaluate the parali burning crisis and explore the possibilities of expanding schemes like the MGNREGA to harvesting and composting.
- The state needs to step in and engage already-existing mechanisms like the MGNREGA for this purpose.
- To do this, the Centre needs to allow states to include activities like harvesting and composting in MGNREGA. This has been a longstanding demand of many states.

Conclusion:

A collective intervention using traditional wisdom and local resources and facilitated by sound administrative support can upturn this national problem.

Do you think Kyoto Protocol's emission trading mechanisms could become redundant after 2020? Analyse while presenting your view points on the upcoming challenge of deciding how markets can be deployed in the service of climate.(250 words)

[Indianexpress](https://www.indianexpress.com)

Why this question:

The article discusses that the Kyoto Protocol's emission trading mechanisms could become redundant after 2020. India needs to plan for the changed scenario.

**Key demand of the question:**

One must analyse the possibilities of the mechanism becoming redundant and present opinion about what should be the way ahead to deal with the emissions from the industries.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:**Introduction:**

In brief explain that the next climate conference to be held in Madrid in December has the challenge of deciding how markets can be deployed in the service of climate.

Body:

Discuss first why Most developed countries are strongly opposed to permitting the carryover of CDM projects and their credits into the Paris Pact's mechanisms.

Explain the stand taken by India.

Explain what does one do to help CDM find a place in the post-2020 markets?

Conclusion:

Conclude that CDM has been a useful source of finance to industry and we may build a viable domestic carbon market in future on the foundations of industry interest as well as environmental protection.

Introduction:

The **Clean Development Mechanism (CDM)** refers to a market mechanism for achieving greenhouse gas emissions reduction and is defined in **Article 12 of the Kyoto Protocol** – an international treaty for emissions reductions. CDM is a product of the Kyoto Protocol, is one such market instrument that can help industry as well as climate. Along with China and Brazil, India is a leader in CDM since its inception in 2007.

Body:

A number of small and medium projects in the field of energy efficiency and renewable energy, set up in India in the last two decades, owe their origin to the financing support available from CDM.

Dangers faced by CDM:

- The situation may change in 2021 when market mechanisms mandated under the Paris Agreement come into operation.
- Most developed countries are strongly opposed to permitting the carryover of CDM projects and their credits into the Paris Pact's mechanisms.
- The credits lying unsold with the CDM projects could lose their economic worth.
- Besides, the CDM projects will have to go through the process of validation and registration again with the new mechanism.
- This will involve additional financial and administrative costs.

India and CDM:

- India has about 250 million Certified Emission Reduction (CER) units under CDM issued by the UNFCCC, the global administrator of Kyoto mechanisms.
- The number of CDM projects registered in India is 1,376 (out of total 7,979 globally) and 89 per cent of these projects are still active.

- The demand in EU, which has been the largest market for CDM credits, has declined sharply over the last decade because of regulatory barriers.
- The unrealised value of CDM credits could be in the range of almost \$5 billion — estimated at a very conservative price of US \$20 per unit.
- India stands to lose substantially if the doors on the existing CDM projects and credits are closed in 2020.

Arguments against CDM:

- CDM has failed to demonstrate environmental benefits in addition to the “business as usual” scenario, or provide technological benefits.
- Its transition to new mechanisms will have adverse impacts on carbon prices and investor sentiments in future markets.
- Double counting could compromise global ambition on reducing GHG emissions.
- The argument that a full-scale transition of CDM credits may flood the market and lead to deterioration in the carbon prices in future markets is also over-stretched.

However, the arguments against CDM are not valid because:

- Credits for CDM projects are issued after their compliance with internationally approved criteria is ascertained.
- CDM project proponents should be free to choose available cost-effective technologies as long as the objective of emission reductions is achieved.
- “additionality” in CDM projects should not be judged solely on the criterion of technology; they are also about investments and overcoming market barriers.
- Validation and registration of projects under the new mechanism may take at least three years.
- Assuming that all CDM units available globally till 2020 are traded immediately, they may be fully absorbed by 2024 — as demand for credits for meeting the Paris commitments increases.
- More than 60 per cent of the credits may be used fully even before 2022 if we take into account the demand from airline operators to meet commitments under CORSIA — an emission reduction scheme for international civil aviation effective from 2021.

Conclusion:

A pragmatic assessment of likely gains and losses from competing approaches to CDM transition into new mechanisms is the need of the hour. CDM has been a useful source of finance to industry and we may build a viable domestic carbon market in future on the foundations of industry interest as well as environmental protection.

The annual ozone hole over the Antarctic has been found to be at its smallest since the 1980s. Explain what causes the hole, and what does the small area this year mean in the context of climate protection efforts?(250 words)

[Indianexpress](https://www.indianexpress.com)

**Introduction:**

An “**ozone hole**”, which builds up over the Antarctic region this time of the year, has been found to be the smallest since it was first discovered in the 1980s. This comes just a month after the UN Environment Programme said that the ozone layer was on track to be completely restored within “our lifetime” itself. Over the years, however, that threat has largely dissipated, as the world has banned the production and consumption of most of the “ozone-depleting substances”. However, it will take another 15-45 years for the ozone layer to be fully restored.

Body:

By absorbing the harmful ultraviolet radiations from the sun, the ozone molecules eliminate a big threat to life forms on earth. UV rays can cause skin cancer and other diseases and deformities, in plants and animals.

Causes for Ozone hole:

- The ‘ozone hole’ is not really a hole. It is a region in the stratosphere, directly above Antarctica, where the concentration of ozone has been measured to become extremely low in certain months.
- Depletion is not limited to that area and has happened in other regions of the stratosphere as well.
- A set of special meteorological and chemical conditions that arise over the Antarctica in the months of September, October and November make the problem much more acute there.
- NASA recently reported that this ozone hole, which usually grows to about 20 million sq. km in September, was less than half that size this year, the smallest it has ever been during this time after being discovered.

Reduction of Ozone hole size in terms of climate change efforts:

- **Montreal Protocol**, the 1989 global agreement, organised international consensus on phased elimination of these chemicals. In subsequent years, the agreement has ensured the phase-out of over 90 per cent of these chemicals.
- Two years ago, an amendment to the Montreal Protocol (**Kigali Amendment**) cleared the way for a faster elimination of another set of similar compounds, called hydrofluorocarbons, or HFCs, which were being used as temporary replacements for CFCs.
- Because of its success in eliminating ozone depleting substances, the Montreal Protocol is often cited as a model for the problem of climate change.
- The chemicals that were dealt with by the Montreal Protocol were used in only some specific sectors and their replacements were readily available, even if at a higher cost differential at that time.
- The economic impact of banning these chemicals, and the disruption it caused, was limited to these sectors. Over the years, these industrial sectors have managed a relatively smooth transition.

However, scientists refute that it's due to climate change efforts:

- NASA said that this could have happened because of extraordinarily high temperatures in the stratosphere this year, rather than the ongoing human efforts to contain the ozone depletion.
- Scientists have reported that temperatures in some areas of the stratosphere — usually over 100 degrees below zero — were 30° to 40°C higher than normal in September this year.
- At least two such extraordinary warming of the stratosphere has been observed in the past, and on both those occasions the ozone hole was also measured to be smaller than usual.

Conclusion:

Climate change, caused by greenhouse gas emissions, is a much more complex, and all-pervasive, problem. The emission of carbon dioxide happens from the most basic of all activity — production and consumption of energy. All other activities require energy to drive them, and therefore there is no escaping carbon dioxide emissions. Even the so called renewable energies have a carbon footprint. Reduction in carbon dioxide emissions affects economic activity and, in turn, the living standards of people. That is why climate change agreements like the Kyoto Protocol could achieve very little till now, while Paris Agreement faces an uphill task.

What is eco-anxiety? Discuss the causative factors of it and suggest solutions to overcome the same. (250 words)

The hindu

Why this question:

The article explains the new concept of eco-anxiety in detail.

Key demand of the question:

Explain what do you understand by eco-anxiety, what are its causative factors and in what way can it be overcome.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief define what eco-anxiety is; The feeling of being overwhelmed by the challenges of climate change and the fear about the state of the environment.

Body:

Discuss the concept in detail – eco-anxiety is the helplessness that makes us see ourselves as just one insignificant entity on the planet, unable to reverse the crisis. It is also the sense that no matter how hard we work, nothing will ever be enough.

One can use the case study of air pollution menace that the capital Delhi is facing and causing anxiety among people and making them insecure.

Suggest what needs to be done and how can one overcome this anxiety.

Conclusion:

Conclude that making climate change an integral and crucial factor in our lifestyle habits and consumption patterns can prove to be a key to the problem.

Introduction:

Eco-anxiety is the feeling of being overwhelmed by the challenges of climate change and the fear about the state of the environment. It is the helplessness that makes us see ourselves as just one

insignificant entity on the planet, unable to reverse the crisis. It is also the sense that no matter how hard we work, nothing will ever be enough. To feel powerless against a supposedly impending doom shoots up stress levels and causes anxiety, say medics. In 2017, the American Psychological Association referred to this condition as Eco-anxiety.

Body:

Causative factors:

- **Climate change:** The World Health Organisation regards climate change as “the greatest threat to global health in the 21st Century”.
- **Unprecedented and Extreme weather events** is a risk factor for mental illness, particularly in rural areas which are being hit the hardest by **unseasonal drought, fires and floods**.
- **Long-term environmental changes, including once fertile land turning to desert, erosion of soil and coastlines, and sea level rise**, are predicted to result in **large-scale displacement**, a major risk factor for mental illness.
- Many thousands of people around the world are **displaced** from their homes as a result of climate events, putting them at perhaps even higher risk of mental illness.
- The **existential dread of what the future holds** in the face of unmitigated climate change is having documented impacts on their mental health.
- A less obvious impact arises from the strong connection **between nutritional status and mental health**. Climate-related impacts on agriculture lead to reduced availability of nutritious foods, and poor nutritional intake can affect mental health.

Solutions:

- **Climate change adaptation strategies** aimed at **strengthening communities**, particularly rural communities most severely affected by drought.
- It will also be important to **invest in areas** where mental health services are under-resourced, which are often the rural areas where the mental health effects of climate change are likely to be most severe.
- **Public awareness** must be generated through the tireless work of advocacy groups and purposeful media reporting of farmers’ personal stories of distress.
- **Relaxation exercises** through yoga and meditation are the best sustainable options for a life with low stress.
- **Make climate change a factor in the decisions** you make around what you eat, how you travel, and what you buy (Lifestyle habits).
- Increasing awareness of the mental health effects of climate change across the community, private, and government sectors.
- Demand that politicians and companies make it easier and cheaper to do the right thing for the climate.

Conclusion:

There will be no single solution to address the mental health impacts of climate change; a broad perspective and a range of actions will be necessary. As the climate crisis continues to unravel in Australia and globally, this will require strong leadership and some innovative thinking.

“Our thirst for more water is making the ocean saltier”, in the light of the above statement discuss increasing salinity as one of the most important environmental issues of the 21st century. (250 words)

Reference

Why this question:

The article brings out the alarming water crisis facing the world and more so Specifically the drying of oceans due to increasing trends of de-salinization of ocean waters.

Key demand of the question:

Discuss the issue in detail and bring out the concerns associated and explain what steps need to be taken to overcome and mitigate the challenges.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Explain first the problem.

Body:

Discuss that, regions without enough drinking water often turns to desalination, the process of removing salt from seawater to make it drinkable. But researchers are now worrying that the process' salty byproducts could wreak havoc on the ocean's delicate ecosystems.

Explain what the crux of the issue is, highlight the contributing factors etc.

Discuss the potential consequences of the problem.

Conclusion:

Conclude with solutions to address the issue and emphasize on the need to have multi-faceted approach.

Introduction:

According to a U.N. backed study, desalination plants across the world produce highly salty waste water and toxic chemicals that are damaging the environment. This study was part of research into how best to secure fresh water for a rising population without harming the environment.

Desalination plants around the world are pumping out far **more salt laden brine** than previously believed. **Brine, water comprising about 5% salt, often includes toxins such as chlorine and copper used in desalination. By contrast, global seawater is about 3.5% salt.** The brine **raises the level of salinity** and poses a major risk to ocean life and marine ecosystems.

Body:

Desalination is the process of removing salts from water to produce water that meets the quality (salinity) requirements of different human uses. Seawater desalination can extend water supplies beyond what is available from the hydrological cycle, providing an “unlimited”, climate-independent and steady supply of high-quality water.

Reasons for increase in desalination plants:

- The “conventional” sources of water such as rainfall, snow-melt and river runoff captured in lakes, rivers, and aquifers are no longer sufficient to meet human demands in water-scarce areas.

- This is in direct conflict with Sustainable Development Goal (SDG) 6, aimed at ensuring the availability of clean water for current and future generations.
- While water demand mitigation approaches such as water conservation and improved efficiencies can somewhat close the water demand and supply gap, these approaches must be combined with supply enhancement strategies in order to combat water scarcity.
- Among the water supply enhancement options, desalination of sea-water and highly brackish water has received the most consideration and is increasingly seen as a viable option to meet primarily domestic and municipal needs.
- More than half the brine comes from four middle eastern countries. These are Saudi Arabia, the United Arab Emirates, Kuwait and Qatar, with Saudi Arabia alone responsible for 22% of the effluent.

Challenges posed:

- Since brine is denser than seawater, it **sinks to the seafloor and disrupts vibrant communities of life**, which find themselves wanting far less salt and far more oxygen.
- The brine reject tends to **create a sort of niche microhabitat with higher levels of salinity** around areas where they are let out.
- Brine reject from the plant is often let out directly onto the beaches and near coastlines, thus **eroding the coastline** and the livelihoods of locals, in addition to **turning the groundwater salty**.
- There is an increase in the temperature of this zone of the sea, together they **decrease the dissolved oxygen level**, which is called **hypoxia** and that impacts the aquatic life in that zone.
- **Hypoxia** often leads to the formation of dead zones in the oceans. These zones have quadrupled since 1950, mainly as a result of climate change. Now the excess salt is adding to these problems.
- Desalination requires **large amount of energy to process seawater**, which is met by burning fossil fuels contributing to global warming.
- Compounding the problem is the ongoing expansion of desalination as more and more countries turn to the technology in the face of climate change which is exacerbating water shortages.

Way forward:

- Desalination plants could dilute their leftover water with freshwater that's clean enough to dump back into the ocean, but not fit to drink.
- Brine is rich in salt content which can be harnessed for extraction of salt by setting up adequate infrastructure near desalination plants
- Instead of flushing brine near coastal areas, it can be channelized and stored underground or piped deep into ocean.

- Harnessing of sea water resources should be included in **the draft National Water Policy framework** released in 2016, with legal safeguards and provisions for management of desalination plants.
- Water rich states like Tamil Nadu receive ample rainfall from the monsoons and might not need large scale desalination plants.
- Setting small viable plants catering to small areas like individual villages using a different desalination technology called **electrodialysis**, powered by solar panels, could provide enough clean, palatable drinking water to supply the needs of a typical village.

Conclusion:

Clearly we have some kinks to work out in the desalination process. And with four billion people now facing water scarcity, we can't afford to waste any time in sorting them out. To meet drinking water needs of cities, conserving and protecting lakes and wetlands is a cheaper and environmentally better option than desalination.

The depleting lake resources lead to not only disturbed hydrology but also loss of local ecology. Analyse with suitable examples. (250 words)

Indianexpress

Why this question:

The article presents a detailed case study of deteriorating ecology at Sambhar Lake.

Key demand of the question:

One must analyse the impact of deterioration of lakes and their effect on the ecology and hydrology.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

In brief highlight the case of Sambhar lake.

Body:

Such answers are best explained with the use of a case study and in this question one can take hints from the article and discuss the case of Sambhar lake and highlight the issues concerning the local ecology and hydrology.

Highlight the need to prevent such depletion of resource, discuss the causative factors in detail and the effect of it.

Conclusion:

Conclude by suggesting solutions to address the problems.

Introduction:

Wetlands are water logged areas like swamps, lakes, salt marshes which have high significance in Environmental sustainability. India has a wealth of wetland ecosystems distributed in different geographical regions. As they support a variety of plant and animal life, biologically they are one of the most productive ecosystems. Over the last 10 days, thousands of migratory birds have been found dead at Sambhar Lake.

Body:

Threats posed due to depleting lake resources:

- **On hydrology:**

- Construction of canals and diversion of streams and rivers to transport water to lower arid regions for irrigation has altered the drainage pattern and significantly degraded the wetlands of the region.
- Might lead to increased greenhouse gases such as methane which tend to be trapped in wetlands.
- Sea water encroachment leading to reduction in availability of drinking water.
- Increased Flood incidents as wetlands will not be able to act as cushion.
- Increased erosion.
- **On local ecology:**
 - Habitat of large no. of flora and fauna will be affected. For example: Migratory birds like Pelicans.
 - Many wading birds and waterfowl like egrets, herons and cranes nest in wetlands. Wetlands also provide food and shelter for mammals.
 - They act as natural filters and help remove a wide range of pollutants from water, including harmful viruses from sewage and heavy metals from industries.
 - Mangrove forests are valued for production of fish and shell-fish, live-stock fodder, fuel and building materials, local medicine, honey and bees-wax and for extracting chemicals used in tanning leather, farming and fisheries production have replaced many mangrove areas.

Measures taken:

- **Ramsar Convention:** The convention is named after Ramsar in Iran in which the convention was ratified in 1971. The convention is aimed at augmenting national action and international cooperation for the conservation and wise use of wetlands and their resources.
- India is a signatory to the convention. So far, 27-sites have been designated as Wetlands of International Importance (Ramsar Sites) and 6 more are under the process of being designated.
- **National Wetland Conservation Programme (NWCP):** It was launched in 1985 to enable conservation and wise use of wetlands in the country so as to prevent their further degradation.
- **The Central Wetlands (Conservation and Management) Rules:** They were notified for the first time in 2010 for better management and regulation of wetlands across the country. It saw the formation of Central Wetlands Regulatory Authority (CWRA) whose term ended on 31 March 2015 and it wasn't reconstituted since then.
- **National Environment Policy 2006:** Recognising the importance of wetlands, it calls for developing a national inventory of such wetlands and implementing a wide spectrum of policies and plans for wetland conservation and their environmental impact assessment (EIA).
- **National Plan for Conservation of Aquatic Ecosystems (NPCA):** It was unveiled in 2015 to provide for policy framework and support to State Governments for integrated management

of wetlands. This initiative was launched by merging two separate Centrally Sponsored Schemes (CSS), namely the National Wetlands Conservation Programme (NWCP) and the National Lake Conservation Plan (NLCP).

- **Capacity Building:** in order to increase the capacity of wetland managers, up gradation of the existing Wetland Research and Training Centre of Chilika Development Authority at Barkul, Odisha into the National Capacity Development Centre for Wetlands is under consideration.

Way forward:

- Educate and communicate society at different levels (managers, community leaders, decision makers, public, children and youth, etc.) on the importance to preserve wetlands ecological integrity highlighting this attribute as a key to maintain healthy ecosystem services
- Stimulate research and knowledge on how sustainable use of renewable natural resources can foster more resilient wetlands
- Promote the conservation and enhancement of wetlands biologic biodiversity and habitat structure
- Promote an ecosystem-based approach to support wetlands management and planning policies, including stakeholder participation and suitable governance processes.
- Relate wetlands conservation with incoming climate changes in different world areas.
- Encourage specialist group participants to stimulate partnerships, collaboration and networking that address problems and visions related to wetlands conservation at large scale and transboundary monitoring.
- Provide guidance and technical skills to managers and other stakeholders (NGOs, CBOs, indigenous and local communities, etc.) interested in assessing and monitoring wetlands and their resources.

The growing intensity of wildfires and their spread to new corners of the globe raise fears that climate change is exacerbating the dangers. Explain how the recent reports commemorate the above fact. (250 words)

Indianexpress

Why this question:

As the leaders of the world's nations assemble in Madrid for the 2019 United Nations Climate Change Conference (COP25) beginning December 2, recent news on the global fight against climate change has been consistently disappointing.

Key demand of the question:

Discuss the growing intensity of wildfires and their spread to new corners of the globe raise fears that climate change is exacerbating the dangers.

Quote the significance of the reports highlighting the same.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In brief narrate the coming of recent reports that have highlighted the alarming situations across the world.

Body:

The United Nations Environment Programme (UNEP) flagship Emissions Gap Report, which went online on Tuesday (November 26), said in its executive summary: "The summary findings are bleak. Countries collectively failed to stop the growth in global GHG emissions, meaning that deeper and faster cuts are now required."

Despite scientific warnings and political commitments, GHG emissions continue to rise, including by China and the United States, the two biggest polluters.

GHG emissions have risen at a rate of 1.5 per cent per year in the last decade, stabilizing only briefly between 2014 and 2016.

Although the number of countries announcing net zero GHG emission targets for 2050 is increasing, only a few countries have so far formally submitted long-term strategies to the UNFCCC.

Discuss what needs to be done.

Conclusion:

Conclude with way forward.

Introduction:

The **National Institute of Disaster Management (NIDM), India** defines forest fire as an unclosed and freely spreading fire that consumes the natural fuels. When a fire burns out of control it is known as Wild Fire. The **Sentinel-3 World Fire Atlas** showed that, compared to August 2018, there were almost five times as many wildfires across the world in August 2019. This has led to increased GHG emissions across the globe. The collective failure of the global fight against climate change and the countries to stop the growth in global GHG emissions gains significance as the leaders of the world's nations assemble in Madrid for the 2019 United Nations Climate Change Conference (COP25)

Body:

Findings from the various climate reports:

▪ **The Emissions Gap Report by The United Nations Environment Programme (UNEP):**

- Despite scientific warnings and political commitments, GHG emissions continue to rise, including by **China and the United States**, the **two biggest polluters**.
- GHG emissions have risen at a rate of 1.5 per cent per year in the last decade, stabilizing only briefly between 2014 and 2016.
- Total GHG emissions, including from land-use change, reached a record high of 55.3 GtCO₂e [gigatonnes (thousand million tonnes) of carbon dioxide equivalent] in 2018
- Although the number of countries announcing net zero GHG emission targets for 2050 is increasing, only a few countries have so far formally submitted long-term strategies to the UNFCCC.
- The emissions gap is large. In 2030, annual emissions need to be 15 GtCO₂e lower than current unconditional NDCs [Nationally Determined Contributions; the heart of the 2015 Paris Agreement] imply for the 2°C goal, and 32 GtCO₂e lower for the 1.5°C goal.
- Dramatic strengthening of the NDCs is needed in 2020. Countries must increase their NDC ambitions threefold to achieve the well below 2°C goal and more than fivefold to achieve the 1.5°C goal.

▪ **World Metrological Organization:**

Telegram: <https://t.me/insightsIAStips>

Youtube: <https://www.youtube.com/channel/UCpocbcX9GEIwaile4HLjwA>

Facebook: <https://www.facebook.com/insightsonindia>

- The emissions of carbon dioxide, methane, and nitrous oxide — all major greenhouse gases — have increased in the atmosphere since the middle of the 18th century.
- **The Production Gap Report by UNEP:**
 - Governments are planning to produce about 50% more fossil fuels by 2030 than would be consistent with limiting warming to 2°C and 120% more than would be consistent with limiting warming to 1.5°C”.
 - The production gap is the largest for coal and by 2030, countries plan to produce 150% (5.2 billion tonnes) more coal than would be consistent with a 2°C pathway, and 280% (6.4 billion tonnes) more than would be consistent with a 1.5°C pathway.
 - Oil and gas are also on track to exceed carbon budgets as countries continue to invest in fossil fuel infrastructure that “locks in” oil and gas use.
 - The effects of this lock-in widen the production gap over time, until countries are producing 43% (36 million barrels per day) more oil and 47% (1,800 billion cubic metres) more gas by 2040 than would be consistent with a 2°C pathway.

Measures needed to tackle wildfires:

- The previous UNFCCC COP meetings have not hammered out the final rules on implementing the Paris climate accord. This should be finalized at COP25 in Madrid.
- At the national level, a cohesive policy or action plan should be formulated to set forth the guiding principles and framework for FFPM. The policy and programmes for forest fire management should incorporate the dimension of climate change
- Forest fire prevention and management practices used by state forest departments also need to be strengthened
- Incorporate Forest Fire Prevention and Management (FFPM) in existing policy and planning documents
- Establish National Forest fire Knowledge Network
- Capacity building of forest officials for better use of early warning systems
- Assess risk and prepare vulnerability and risk maps
- Document national and international good practices and utilise them for making forest fire management more effective and practical
- Increase community awareness

Conclusion:

The current increase in extreme fires in some regions is part of a global ecosystem shift driven by human-caused global warming. To minimize that risk as much as possible, very strong climate policy focussing on reducing the carbon emissions must be implemented.

The importance of Indigenous traditional knowledge can be applied to urban environments for sustainable ecosystem and future building structures. Elucidate. (250 words)

Indianexpress

Why this question:

The article brings out a recent research that has investigated the jing kieng jri or living root bridges structures and proposed to integrate them in modern architecture around the world, and potentially help make cities more environment-friendly.

Key demand of the question:

One must explain the significance that Indigenous traditional knowledge holds in ensuring sustainable ecosystem and future building structures.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In brief discuss the importance of traditional techniques, knowledge and practices.

Body:

Explain in detail with suitable examples across the country how traditional indigenous techniques can help and aid in forming a sustainable and viable ecosystem.

Take hints from the article and present the case of Meghalaya's root bridges built by the local tribes and in what way they are an amusement of traditional knowledge and technique.

Conclusion:

Conclude with significance of such knowledge.

Introduction:

Traditional knowledge (TK) refers to the knowledge, innovations and practices of indigenous and local communities around the world. Developed from experience gained over the centuries and adapted to the local culture and environment, traditional knowledge is transmitted orally from generation to generation. It tends to be collectively owned and takes the form of stories, songs, folklore, proverbs, cultural values, beliefs, rituals, community laws, local language, and agricultural practices, including the development of plant species and animal breeds.

The significance of traditional knowledge:

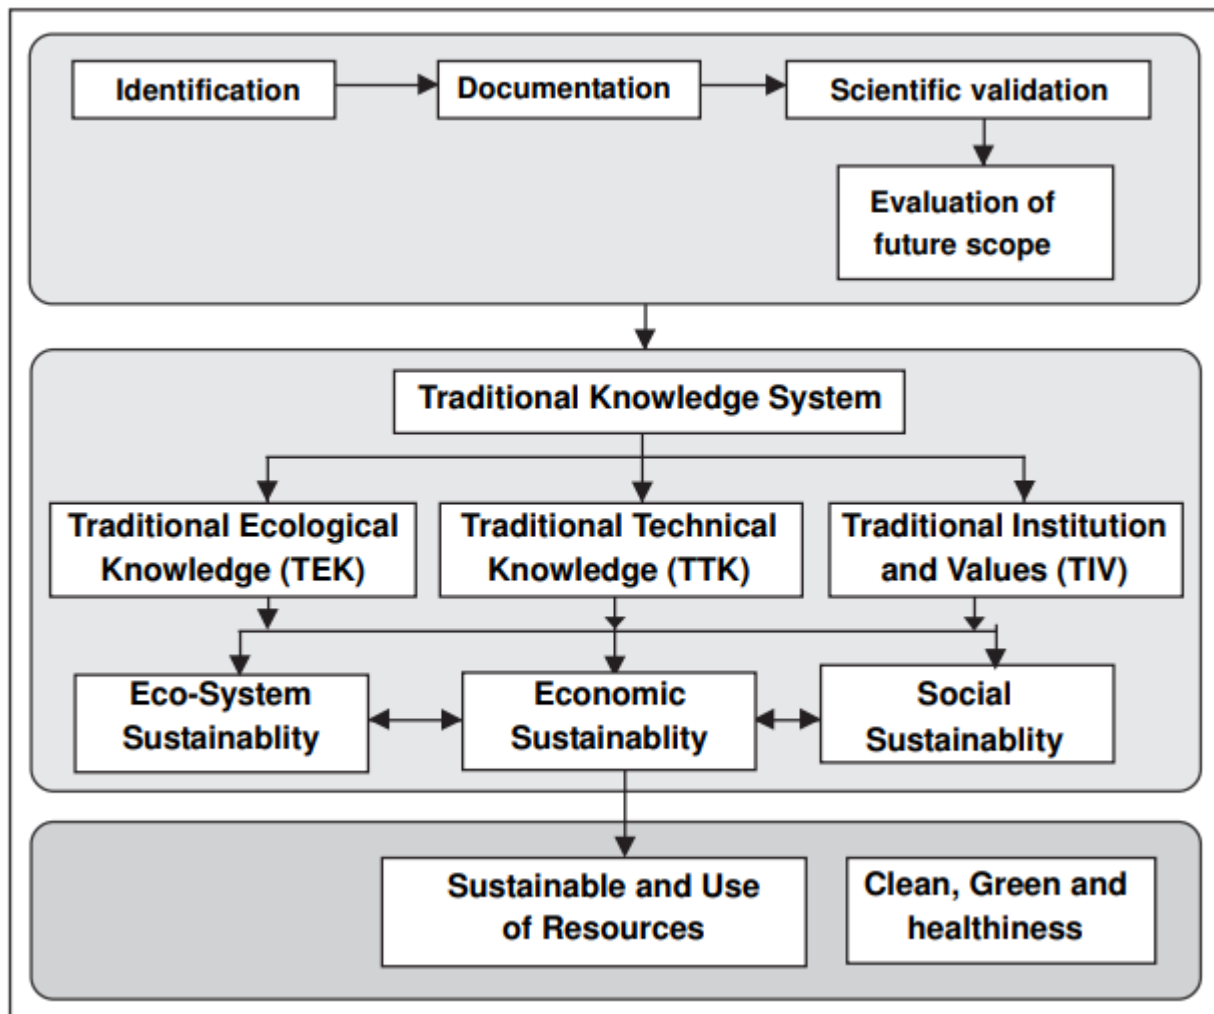

- Traditional knowledge (TK) is integral to the identity of most local communities. It is a key constituent of a community's social and physical environment and, as such, its preservation is of paramount importance.
- Attempts to exploit TK for industrial or commercial benefit can lead to its misappropriation and can prejudice the interests of its rightful custodians.
- In the face of such risks, there is a need to develop ways and means to protect and nurture TK for sustainable development in line with the interests of TK holders.
- The preservation, protection and promotion of the TK-based innovations and practices of local communities are particularly important for developing countries.
- Their rich endowment of TK and biodiversity plays a critical role in their health care, food security, culture, religion, identity, environment, trade and development. Yet, this valuable asset is under threat in many parts of the world.

- There are concerns that this knowledge is being used and patented by third parties without the prior informed consent of TK holders and that few, if any, of the derived benefits are shared with the communities in which this knowledge originated and exists.
- Such concerns have pushed TK to the forefront of the international agenda, triggering lively debate about ways to preserve, protect, further develop and sustainably use TK.
- Documenting and digitizing TK-related information in the form of a TKDL is proving to be an effective means of preserving TK and of preventing its misappropriation by third parties. India is a pioneer in this field.

Examples for Indigenous traditional knowledge practices:

- **Traditional Water harvesting practices:** There are many age-old-practices of harvesting water in the country, basically to collect rainwater, restore surface flow of water, ground water recharging, etc. These are based on simple technology and defined management principles
- **Traditional Housing - a reflection of STI:** Usually these are called Vernacular Architecture, which is an architectural style and design based on local needs, availability of construction materials and reflecting local traditions. Originally, vernacular architecture relied on the design skills and tradition of local builders/ skilled labours
- **Traditional agricultural practices:** In many areas of the country, traditional agricultural practices are still considered important. These practices are followed in selection of crop varieties, land selection, land preparation, soil fertility management, pest and disease management, irrigation, harvesting, post-harvest management, seed preservation, etc.
- **Weather Forecasting/ Prediction:** There are many methods of weather prediction practiced by the farmers in different parts of the country. *For example, farmers in Himachal Pradesh believe that if the honeybee flies toward northern hill there will be no rainfall, if they fly towards south there will be good rainfall.*
- **Traditional practices in animal husbandry:** Traditional knowledge regarding animal husbandry can be considered as old as domestication of various livestock species. But these practices are in vogue throughout rural India and those are documented little and hence, there are possibilities of eroding out of these knowledge systems. *For example, traditional practice of the feeding includes crop residues like straw, stalks, stoves, tops and crop thrush like wheat, paddy straw, etc as well as crop by-products that includes Bran, Husk, straw of Wheat, Rice, Bajra and Maize.*

Indigenous traditional knowledge holds in ensuring sustainable ecosystem and future building structures:

- New research investigates the jing kieng jri or living root bridges structures and proposes to integrate them in modern architecture around the world, and potentially help make cities more environment-friendly.
- Researchers from Germany investigated 77 bridges over three expeditions in the Khasi and Jaintia Hills of Meghalaya during 2015, 2016 and 2017. Taking into account structural properties, history and maintenance, morphology and ecological significance, the study, published in the journal Scientific Reports, suggests that the bridges can be considered a reference point for future botanical architecture projects in urban contexts.
- The findings relating to the traditional techniques of the Khasi people can promote the further development of modern architecture
- they are “not planning to create new living bridges for contemporary cities” right away, the researchers believe this extraordinary building technique can help facilitate “better adaptation to the impacts of climate change”.

- We can see a great potential to use these techniques to develop new forms of urban green in dense cities,”
- By understanding the growth history, we can learn how long the bridge has taken to grow to its current state and from there design future growth or repairs, or growth of other bridges,”
- A root bridge uses traditional tribal knowledge to train roots of the Indian rubber tree, found in abundance in the area, to grow laterally across a stream bed, resulting in a living bridge of roots.
- The process begins with placing of young pliable aerial roots growing from *Ficus elastica* (India rubber) trees in hollowed out Areca catechu or native bamboo trunks.
- These provide essential nutrition and protection from the weather, and also perform as aerial root guidance systems.
- Over time, as the aerial roots increase in strength and thickness, the Areca catechu or native bamboo trunks are no longer required.
- What is crucial for a root bridge to survive is the development of an ecosystem around it. “Specifically the entire biology, the entire ecosystem, and the relationship between the people and the plants, which have, over the centuries, kept it going,”
- Architectural structures made of *Ficus elastica* plants — is sound in urban environments. This is because of the robustness of the plant itself,”
- Traditional knowledge systems are today being gradually replaced with modern lifestyle preferences and unsustainable development practices. ***For instance, traditional architecture is fast becoming extinct due to the emergence of concrete structures; hydraulic technologies are being replaced by a network of pipes and hand pumps; traditional medicinal systems have given way to allopathic treatment; and, traditional metallurgy has been wiped out by non-stick cookware.***

Way forward:

- To ensure that indigenous and local communities obtain a fair and equitable share of the benefits arising from the use and application of their traditional knowledge;
- To ensure that private and public institutions interested in using such knowledge obtain the prior informed approval of indigenous and local communities;
- To regulate how impact assessments are carried out regarding any proposed development on sacred sites or on land and waters occupied or used by indigenous and local communities; and
- To assist Governments in the development of legislation or other mechanisms to ensure that traditional knowledge, and its wider applications, is respected, preserved, and maintained.

Disaster and disaster management.

India being one of the most flood affected nations in the world requires strong and healthy coordination between Centre and States for long term flood management.

Analyse. (250 words)

Financial Express

Why this question:

The article highlights the fact that Floods constitute 52% of all natural disasters in India. Thus the question aims to assess the need and significance of coordination between Centre and States for long term flood management in the country.

Key demand of the question:

One must explain the importance of coordination between Centre and States for long term flood management.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

In brief quote data suggesting the flood scenario in the country.

Body:

Explain that As per the National Emergency Response Centre (NIDM), 1,614 people were killed and 1.8 million displaced (as on September 25, 2019) in 14 states. Widespread floods have also damaged crops, houses and infrastructure.

India is one of the most flood-affected nations in the world, after Bangladesh. Floods constitute 52% of all natural disasters in India, and the costliest as well, with over 63% of all damages attributed to it. Between 1980 and 2017, 70,901 people were killed, 1,395 million affected, and 56 million houses damaged due to floods.

Discuss the causative factors, suggest what methods are required to overcome them and highlight the importance of healthy relations between centre and state to overcome the same.

Conclusion:

Conclude with way forward.

Introduction:

In an unnerving reminder of last year's devastating floods, **Kerala's** worst in about 100 years, incessant precipitation has deluged many districts, causing havoc, snapping communication lines and claiming several lives. Rains have battered **Karnataka and Maharashtra**, too, leaving many dead and several missing. Meanwhile, dramatic visuals from **Madhya Pradesh, Rajasthan and Gujarat** have revealed widespread distress. Parts of **Bihar and Assam** are also reeling under torrential rainfall, with a large number of people left battling grim circumstances. As per the National Emergency Response Centre (NIDM), 1,614 people were killed and 1.8 million displaced (as on September 25, 2019) in 14 states. Widespread floods have also damaged crops, houses and infrastructure.

Body:

Flood devastation in India:

- India is one of the most flood-affected nations in the world, after Bangladesh.

- Floods constitute 52% of all natural disasters in India, and the costliest as well, with over 63% of all damages attributed to it.
- Between 1980 and 2017, 70,901 people were killed, 1,395 million affected, and 56 million houses damaged due to floods.
- The economic losses due to this destruction stood at ₹3,686,340 million, which translates to 0.43% of GDP.
- The damages translate to 2.68% of the Centre's total expenditure every year.
- The average annual flood damage as a percentage of GSDP is the highest in Himachal Pradesh (2.35%), followed by Andhra Pradesh (1.62%), Odisha (0.9%) and Bihar (0.85%), with the lowest damage in Maharashtra (0.03%).

Measures needed for flood management:

- Policy measures:
 - State governments should focus on economic development by building flood-resilient infrastructure—monitoring embankments of key flood-prone rivers and improving river connectivity, apart from construction of canals, assumes significance.
 - Suitable techniques and methods should be in place to predict accurate rainfall, especially in low-lying areas, and appropriate rainfall warning systems be installed in vulnerable areas.
 - Long-term flood management requires a healthy coordination between the Centre and states. Unless concerted efforts are undertaken in these areas, the deluge will become a regular event.
- The dire need is for **watershed-based master planning and development legislated guidelines** for each major river basin, especially those that impact densely populated settlements.
- There must be a demarcation of ecologically sensitive zones using existing village survey maps and public participation.
- There must be clear land use plan for these zones specifying flood plains, protected forest areas, agricultural and plantation zones, with details of the types of crops, building usages permitted and the density of buildings permitted.
- To compensate owners in non-buildable areas, there must be strategies such as Transfer of Development Rights to buildable zones in cities.
- The master plan should focus on permitting only ecologically sensitive building strategies for these areas by proposing new construction techniques.
- Controlled development can be proposed using building height rules, floor area ratio control, and restrictions on cutting and filling natural land.
- Strategies to make sure that all infrastructure projects are carried out in a scientific manner with strict scrutiny must be specified.

- This should include roads built on difficult terrain and all public infrastructure projects in wetlands and the High Ranges.
- Copenhagen in Denmark, which faces a similar problem of repeated flooding, has come up with active cloudburst responsive planning as a process to develop the city in line with climate change needs.

Conclusion:

A complete overhaul of processes to hire technical expertise which allows access to necessary skills, and with a long-term vision of capacity building of local agencies, is the way forward. Long-term flood management definitely requires healthy coordination between Centre and states.

Linkages between development and spread of extremism.

India's claims to being a legitimate power in cyberspace have come under doubt following two recent revelations – the breach at Kudankulam Nuclear Power Plant and the recent WhatsApp spyware attack. Do you think these instances point out to a weakening of India's cyber sovereignty? Critically analyse. (250 words)

The hindu

Why this question:

The recent incidents of cyber security infringement cast serious doubts on the Indian state's claims to being a legitimate power in cyberspace, both due to the vulnerability of its critical information infrastructure and blatant disregard for the fundamental rights of its citizens online. Thus the question.

Key demand of the question:

One has to critically analyse the context of India's weakening cyber sovereignty, what has gone wrong and what needs to be done to tackle the situation.

Directive:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgment.

Structure of the answer:

Introduction:

Define what cyber sovereignty is.

Body:

Explain first the two recent incidents – The malware attack at the Kudankulam Nuclear Power Plant and the recent spyware attack by Pegasus on WhatsApp.

Discuss the glaring issues highlighted by these cases.

Explain in what way the apparent absence of robust cybersecurity capability is a serious cause for concern.

Suggest solutions and way forward.

Conclusion:

Conclude that If the Indian state plans to leverage offensive and defensive cyber capabilities, which are of course it's right as a sovereign power, it needs to get serious about cybersecurity.

Introduction:

The two recent incidents of cyber-attacks cast serious doubts on the Indian state's claims to being a legitimate power in cyberspace, both due to the vulnerability of its critical information infrastructure

and blatant disregard for the fundamental rights of its citizens online. In essence, the government has signalled that it has no qualms about weakening the security of civilian digital platforms, even as it fails to secure its strategic infrastructure from sophisticated cyberattacks.

Body:**Recent incidents of cyber-attacks in India:**

- On October 28, a user on VirusTotal identified a DTrack data dump linked with the Kudankulam Nuclear Power Plant — indicating that a system (or more) in the plant had been breached by malware. The Nuclear Power Corporation of India Ltd (NPCIL) confirmed the breach, doing a volte-face after an initial denial.
- Separately, WhatsApp sued the Israel-based NSO Group for the use of its 'Pegasus' spyware on thousands of WhatsApp users in the lead-up to the general elections.

Yes, it points to India's weakening of cyber-security due to the following issues:

- Contrary to what the NPCIL may claim, air-gapped systems are not invulnerable. Stuxnet crossed an air gap, crippled Iran's nuclear centrifuges and even spread across the world to computers in India's critical infrastructure facilities.
- It is also not enough to suggest that some systems are less important or critical than others — a distributed and closed network is only as strong as its weakest link.
- With the Indian military announcing that it will modernise its nuclear forces, which may include the incorporation of Artificial Intelligence and other cyber capabilities, the apparent absence of robust cybersecurity capability is a serious cause for concern.
- The surveillance of Indian citizens through WhatsApp spyware in the lead-up to the general elections highlights the vulnerability in the field of cybersecurity.
- It is in line with the government's ceaseless attempts at enforcing the "traceability" of end-to-end encrypted messages on WhatsApp. A backdoor, once opened, is available to any actor — good or bad.
- To use it without oversight belies reckless disregard for the integrity of electronic information.

However, Government has taken up multiple steps to secure the cyber-space:**Information Technology Act, 2000**

- The act regulates use of computers, computer systems, computer networks and also data and information in electronic format.
- The act lists down among other things, following as offences:
 - Tampering with computer source documents.
 - Hacking with computer system
 - Act of cyber terrorism i.e. accessing a protected system with the intention of threatening the unity, integrity, sovereignty or security of country.
 - Cheating using computer resource etc.

**Strategies under National Cyber Policy, 2013**

- Creating a secure cyber ecosystem.
- Creating mechanisms for security threats and responses to the same through national systems and processes.
- National Computer Emergency Response Team (CERT-in) functions as the nodal agency for coordination of all cyber security efforts, emergency responses, and crisis management.
- Securing e-governance by implementing global best practices, and wider use of Public Key Infrastructure.
- Protection and resilience of critical information infrastructure with the National Critical Information Infrastructure Protection Centre (NCIIPC) operating as the nodal agency.
- NCIIPC has been created under Information Technology Act, 2000 to secure India's critical information infrastructure. It is based in New Delhi.
- Promoting cutting edge research and development of cyber security technology.
- Human Resource Development through education and training programs to build capacity.

Cyber Surakshit Bharat Initiative: It was launched in 2018 with an aim to spread awareness about cybercrime and building capacity for safety measures for Chief Information Security Officers (CISOs) and frontline IT staff across all government departments.

National Cyber security Coordination Centre (NCCC): In 2017, the NCCC was developed. Its mandate is to scan internet traffic and communication metadata (which are little snippets of information hidden inside each communication) coming into the country to detect real-time cyber threats.

Cyber Swachhata Kendra: In 2017, this platform was introduced for internet users to clean their computers and devices by wiping out viruses and malware.

Training of 1.14 Lakh persons through 52 institutions under the Information Security Education and Awareness Project (ISEA) – a project to raise awareness and to provide research, education and training in the field of Information Security.

International cooperation: Looking forward to becoming a secure cyber ecosystem, India has joined hands with several developed countries like the United States, Singapore, Japan, etc. These agreements will help India to challenge even more sophisticated cyber threats.

Way forward:

- Real-time intelligence is required for preventing and containing cyber-attacks.
- Periodical 'Backup of Data' is a solution to ransomware.
- Using Artificial Intelligence (AI) for predicting and accurately identifying attacks.
- Using the knowledge gained from actual attacks that have already taken place in building effective and pragmatic defence.
- Increased awareness about cyber threats for which digital literacy is required first.
- India needs to secure its computing environment and IoT with current tools, patches, updates and best known methods in a timely manner.

- The need of the hour for Indian government is to develop core skills in cyber security, data integrity and data security fields while also setting stringent cyber security standards to protect banks and financial institutions.

Conclusion:

India must plan to leverage offensive and defensive cyber capabilities, by getting serious about cybersecurity. There must not be piecemeal approach: The security of a billion hand-held devices is of equal strategic value to the country's nuclear assets.

Extremism originating from the region can be fought successfully if the historical and sociological reasons for it are suitably addressed. Do you agree? Elucidate. (250 words)

The hindu

Why this question:

The article brings out a report that highlights the fact that Pakistan failed to "significantly limit" Punjab militant outfits like the Lashkar And the Jaish-e-Mohammed (JeM) which has posed significant threats to India's security interests.

Key demand of the question:

One has to explain in what way extremism originating from the region can be fought successfully if the historical and sociological reasons for it are suitably addressed.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In brief highlight the situation.

Body:

First explain what the reasons for increased militancy are in this region.

Discuss that Political marginalization, weak governance, economic neglect and glaring income inequity are also some of the main reason violent extremism in this region.

Discuss what needs to be done to overcome it.

Conclusion:

Conclude with solutions.

Introduction:

The U.S. Congress's just-released 'Country Reports on Terrorism' for 2018 has mentioned that Pakistan failed to "significantly limit" Punjab-based militant outfits like the Lashkar-e-Taiba (LeT) and the Jaish-e-Mohammed (JeM). Contemporary discussions on extremism originating from the province are mostly framed around the Pakistani military's support to these extremist groups.

Body:

Historical and Sociological reasons behind the extremism in J&K:

• The dominant province:

- Punjab overshadows other provinces in Pakistan primarily due to its size, resources and representation in elite institutions.

- It can be broken into three broad sub-cultural units: The Punjabi-speaking eastern and central Punjab; the Pothwari-speaking northern Punjab that includes Rawalpindi and Islamabad; and the Saraiki-speaking southern Punjab.
- a less-acknowledged fact in Partition studies is the massive outflow of Muslims from the plains of J&K, mostly the southern part i.e. Jammu, in 1947.
- **Seasonal water scarcity:**
 - Another issue used by militants to gain support is that of seasonal water scarcity.
 - The name 'Punjab' was derived from the Persian words panj (five) and ab (waters). The five rivers referred to here — Chenab, Jhelum, Beas, Sutlej and Ravi — flow through the Punjab's territory.
 - Whenever there is seasonal water scarcity, terrorist outfits such as LeT point fingers at India. The 'jihad in Kashmir' is presented as a necessity by organisations like the Jamaat-ud-Dawa (JuD) to save Punjab's agriculture.
 - In the past, Hafiz Saeed, LeT founder and alleged mastermind of the Mumbai attacks, has repeatedly tried rallying support of locals alleging that 'India is in the process of constructing several dams on Chenab, Jhelum and Indus rivers in a bid to completely stop the flow of water towards Pakistan'.
- **Political marginalisation:**
 - A 2016 International Crisis Group paper, written exclusively on violent extremism in southern Punjab, had stated that among the reasons for support for militancy in the "rural and relatively poorly developed" part of the province were "political marginalisation, weak governance, economic neglect and glaring income inequity".
 - the role played by economically poor Muslim migrants from India in the spread of a radical version of the Deobandi School of Islam.
 - The poverty of the Muslim migrants from India was in marked contrast to the prosperity of large landowners in rural areas, who were mostly Shias and Barelvīs and formed the political elite.

Measures needed:

- Deal with the separatist elements with a heavy hand and place a blanket ban on their conspiratorial confabulations with the Pak authorities, both in Delhi and in Islamabad.
- Any contacts with the terrorist outfits active in/ J&K should be dealt with under the Unlawful Activities (Prevention) Act.
- ensure comprehensive socio- economic development of the State, ensuring accountability in the utilization of funds;
- Initiate appropriate measures to bring back and rehabilitate the Kashmiri Pandits who were dislodged from their homes and forced to seek shelter in other parts of the country.
- Keep the issue of Pakistan Occupied Kashmir (PoK) alive and put pressure on China to withdraw from the areas it has occupied in J&K.

Conclusion:

Apart from dealing with the challenge posed by the deep state's support for these outfits, we also need knowledge of the sociological and historical nuances pertaining to the Punjab province. Such an understanding is necessary to develop a holistic response to counter the extremist threat.

Challenges to internal security through communication networks, role of media and social networking sites in internal security challenges, basics of cyber security; money-laundering and its prevention

Examine the position of data protection law in the country? After the recent WhatsApp breach, what should be the way forward? Comment. (250 words)

The hindu

Why this question:

The article discusses the recent incidents of data breaches and the compromised cyber security.

Key demand of the question:

Discuss the position of data protection law in the country and suggest way forward.

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

In brief discuss the security aspect of the country.

Body:

Explain in detail the data protection scenario of the country. Explain the legal routes to surveillance that can be conducted by the government.

Discuss the laws governing this.

Explain the laws regarding legal surveillance.

Discuss the Supreme Court verdict on privacy.

Conclusion:

Conclude with way forward.

Introduction:

The recent incident of Israeli software, Pegasus, which had been used to hack the WhatsApp accounts of — and spy on — numerous Indian human rights defenders, activists, and lawyers. It is yet to be determined who authorised this surveillance — and why — but the revelations placed a renewed spotlight upon the legal framework governing privacy and surveillance in India. The Government's reaction to messaging platform WhatsApp's revelation is inadequate and, more unfortunately, far from reassuring.

Body:

Legality of surveillance in India:

- There are legal routes to surveillance that can be conducted by the government.
- The laws governing this are the **Indian Telegraph Act, 1885**, which deals with **interception of calls**, and the **Information Technology (IT) Act, 2000**, which deals with **interception of data**.
- Under both laws, **only the government**, under certain circumstances, is permitted to conduct surveillance, and **not private actors**.

- **Hacking is expressly prohibited under the IT Act.**
- Section 43 and Section 66 of the IT Act cover the civil and criminal offences of data theft and hacking respectively.
- Section 66B covers punishment for dishonestly receiving stolen computer resource or communication.
- The punishment includes imprisonment for a term which may extend to three years.
- However, the Supreme Court laid down some guidelines that were later codified into rules in 2007. This included a specific rule that orders on interceptions of communication should only be issued by the Secretary in the Ministry of Home Affairs.

Position of Data protection laws:

- The Supreme Court in a landmark decision in August, 2017 (**Justice K. S. Puttaswamy (Retd.) and Anr. vs Union of India and Others**) unanimously upheld **right to privacy as a fundamental right under Articles 14, 19 and 21 of the Constitution**.
- It is a building block and an important component of the legal battles that are to come over the state's ability to conduct surveillance.
- But as yet a grey area remains between privacy and the state's requirements for security.
- In the same year, the government also constituted a **Data Protection Committee under retired Justice B.N. Srikrishna**.
- It held public hearings across India and submitted a draft data protection law in 2018 which Parliament is yet to enact.
- Experts have pointed out, however, that the draft law does not deal adequately with surveillance reform.

An U.K.-based security firm Comparitech did a survey of 47 countries to see where governments are failing to protect privacy or are creating surveillance states. They found that only five countries had "adequate safeguards" and most are actively conducting surveillance on citizens and sharing information about them. China and Russia featured as the top two worst offenders on the list. India was third on the list as data protection Bill is yet to take effect and there isn't a data protection authority in place

Other stringent measures needed to protect the Right to Privacy of individuals:

- Conscientious whistle-blowers, and a free and active press will be required.
- when cases of extra-legal and unauthorised surveillance come to light, the courts have a role to play in ensuring that the rule of law is upheld and vindicated.
- the State must not be permitted to take advantage of breaking the law and illegally snooping on citizens.
- In a country where data protection and privacy laws are still in a nascent stage, incidents such as this highlight the big dangers to privacy and freedom in an increasingly digital society.

- There is a need to bring in the **data protection bill** and the antiquated **1885 Telegraph Act, and its attendant rules** should be reformed.
- It is thus imperative that the Government sends a strong message on privacy, something that the Supreme Court in 2017 declared to be intrinsic to life and liberty and therefore an inherent part of the fundamental rights.

Conclusion:

The urgent need of the hour to bring in laws that limit the State's powers of surveillance only to those situations where it is strictly necessary and never conducted in bulk, upon the entire population. The more important, introduce stringent penalties for illegal surveillance, if — and when — that comes to light. The WhatsApp-Pegasus controversy affords a golden opportunity to do just that.

To what extent do you think Social media has reshaped caste mobilisation tendencies among people? And if so, in what possible ways? Critically analyse. (250 words)

Hindustantimes

Why this question:

The advent of social media has heralded a new era in public discourse. Popular social media platforms such as Facebook and Twitter have allowed the forging of new networks among like-minded people, and changed the contours of public debate and socio-political mobilisation.

Key demand of the question:

One must discuss how social media has reshaped caste imagination and mobilisation in the country.

Directive:

Critically analyse – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgment.

Structure of the answer:

Introduction:

In brief discuss social media, its key aspects.

Body:

First trace the mobilisation of caste historically in the absence of social media.

Then discuss the impact social media has shed upon the caste mobilisation factor.

Discuss both pros and cons.

Explain with examples how it is evident that the trends of mobilisation are changing with the influence of social media.

Conclusion:

Conclude with need to regulate social media with respect to caste mobilisation factor in a positive direction.

Introduction:

Popular social media platforms such as Facebook and Twitter have allowed the forging of new networks among like-minded people, and changed the contours of public debate and socio-political mobilisation. Since caste is omnipresent in India, it is not surprising that it has touched social media. According to a recent Lokniti-CSDS study, the spread of social media has largely been among the upper-castes in urban centres, followed by the Muslims. But there is an increasing presence of those belonging to the SC/ST and OBC communities in recent years.

**Body:**

All around the world, social media has given a voice to anyone who wants to speak. In India, it has empowered the country's most oppressed group, dalits (formerly known as untouchables), to speak their minds, without fear of punishment, for the first time in history.

Social media is reshaping Caste mobilization:

- Historically, the representation of the subaltern castes in the media has been negligible.
- Unable to find their voices and issues heard in the mainstream media space, they created an alternative space for information dissemination.
- While social media is often accused of being casteist and discriminatory, it is the only media space that has provided the subaltern castes with the freest and least-discriminatory platform to create their discourse and ideate.
- It has led to the organic growth of subaltern media, and explosion of a Dalit-Bahujan discourse, including that of the Pasmandas (the subaltern lower caste Muslims).
- Social media is replacing pamphlets in the political rallies of parties such as the Bahujan Samaj Party (BSP) as the preferred medium of dissemination of counterculture.
- The social media channels of Dalit-Bahujan groups have thousands of subscribers now, and their posts and videos are shared widely, even though they may be invisible in mainstream discourse.
- Social media has also reshaped caste imagination because now people can overcome the ghetto mentality, which was ingrained by caste-based socialisation.
- For a large number of youth in the villages and small towns, social media has provided an opportunity to interact with people who don't think like them and don't fit into their social worldview.
- This has sharpened the contrast between the subjective notions of the social status of their caste, with the objective reality, resulting in bitterness and aggression.
- This has enabled caste-based mobilisation on a far larger scale.

Recent instances of how social media is reshaping caste mobilization:

- Recently, protests broke out against Twitter over the allegations of a systematic denial of the blue tick verification to handles belonging to the Dalit and backward communities.
- Even the official handles of Prakash Ambedkar or the Bhim Army chief were not verified, while the handles of even the lesser-known members of liberal chatterati, with a few thousand followers, would have the blue tick.
- Hard-hitting Twitter hashtags trended for several days accusing the company of being a casteist enterprise, and asking it to either verify the handles of public figures of the Scheduled Caste/Scheduled Tribe (SC/ST) and Other Backward Classes (OBC) communities, or cancel blue ticks of all accounts.

- Caste mobilization using social media was visible during the April 2018 protests against an order of the Supreme Court on the Scheduled Caste and Scheduled Tribe (Prevention of Atrocities) Act, 1989.
- YouTube is also flooded with the new age songs of caste-assertion and caste-glorification, often descending into humiliating “others”.

Challenges faced:

- Despite having a rapidly-growing user base on social media platforms, these communities hardly find any representation in the organisations and policymaking of these companies.
- This has led to allegations of a systematic caste bias in the policies and the social media platforms’ ways of working.
- The top echelons of the social media companies are headed by the upper caste hindu people or foreigners.

Way forward:

- Social media companies need to have a transparent user policy and take action against caste-based abuse and demonetisation.
- Currently, the standard reply of Twitter to such abuse is that it doesn’t find a violation of rules in the reported content.
- There must also be more transparency in the parameters used in their algorithms and mechanisms adopted for decision-making.
- Suspension of accounts will go a long way in ensuring the credibility of these platforms amid allegations of ideological, political or social biases.

Effective counter-terrorism requires a more comprehensive strategy. It requires a constant process of evaluation and adjustment. Comment in the light of India’s “zero tolerance” policy on terrorism.(250 words)

The hindu

Why this question:

The article discusses the role of Counter Terrorism programme, NATGRID which is a post Mumbai 26/11 attack measure. It highlights the Israeli model of comprehensive strategy.

Key demand of the question:

Explain India’s strategy for counter terrorism in detail.

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

The current government has declared a “zero tolerance” policy on terrorism.

Body:

Present a brief background – India’s military responses in 2016 (surgical strikes) and 2019 (Balakot airstrikes) in the backdrop of terrorist attacks in Uri and Pulwama, were framed as attempts to impose costs on the Pakistani terrorist groups and their Army backers.

These responses mark a drastic change in India’s approach to counter-terrorism.

The present government has repeatedly declared that it will emulate Israel's apparently successful strategy in responding to cross-border terrorism.

Discuss the concerns associated.

Conclusion:

Conclude that Effective counter-terrorism requires a more comprehensive strategy. It requires a constant process of evaluation and adjustment – Israel does not have all the answers and relies on trial and error for different contexts.

Introduction:

Terrorism has become a global phenomenon posing major threat to international peace, security and stability. Access to advance technology, including cyberspace, sophisticated communications, global funding and military grade weapons has given such groups enormous strength. Terrorism constitutes one of the principal challenges at the global, regional and national levels and has become a key factor in national security planning.

The current government has declared a “zero tolerance” policy on terrorism. India's military responses in 2016 (surgical strikes) and 2019 (Balakot airstrikes) in the backdrop of terrorist attacks in Uri and Pulwama, were framed as attempts to impose costs on the Pakistani terrorist groups and their Army backers.

Body:

Key challenges in India's counterterrorism efforts:

- The present government's emulation of Israel's strategy in responding to cross-border terrorism seems to mischaracterize Israeli strategy.
- There is a place for punishment in counter-terrorism but India risks overemphasizing the narrow role of military punishment, and it fails to consider other elements of strategy, which Israel itself has embraced, that are critical to counter-terrorism effectiveness.
- The use of military action at best allows the punisher to manage the ongoing conflict, and communicate diminishing patience with the adversary.
- Providing sponsorship and safe havens have further played a major role in the phenomenal growth of global terrorism.
- In addition, State support has granted terrorist groups access to resources, guidance and logistics, which would normally be beyond their capabilities. Any effort to counter the activities of terrorist groups carries the danger of placing the victim nation in direct confrontation with the host nation and its resources.
- Terrorism is handled by different state police systems with no legal role by the central government under Schedule 7 of our Constitution. Similarly, the intelligence provided by the central government to the states is only of advisory nature.
- In many countries concurrent powers are given to the central government to intervene when a state fails to take security measures. Unfortunately, India does not have that system.
- Intelligence agencies which were once able to operate beyond their borders are finding it difficult to detect transnational tentacles, even within their country, of al Qaeda or IS.
- Lack of citizen participation and private sector participation in beefing up the security apparatus

- Absence of “bottom up” security architecture
- Lack of coordination between agencies
- India’s counter-terror efforts continue to be thwarted due to lack of international collaboration in respect of exchange of information and evidence or of extradition of the accused persons who are hiding outside India’s territory.
- The online propaganda of the terrorist groups is radicalising the youth for instance ISIS influencing the youth

Measures taken:

- India has taken steps for setting up of Joint Working Groups (JWGs) on counter-terrorism/security matters with key countries.
- Bilateral treaties on Mutual Legal Assistance (MLATs) in Criminal matters to facilitate investigation, collection of evidence, transfer of witnesses, location & action against proceeds of crime etc. have been signed with other countries.
- India boosted the security-related infrastructure at the border management by launching new schemes, and have been able to successfully minimize cross-border-infiltration.
- Similarly, Indian government has allocated substantial funds to the police modernisation programmes all over the country with a view to ensure quick and better response mechanisms.
- India has raised Regional Hubs of NSG battalions in important strategic locations, to meet any unforeseen challenges.
- India created a new Division in the Home Ministry exclusively to deal with Counter Terrorism.
- Stringent acts such as UAPA
- Coastal security was given high priority, and it is with the Navy/Coast Guard/marine police.
- A specialised agency to deal with terrorist offences, the National Investigation Agency, was set up and has been functioning from January 2009.
- The National Intelligence Grid (NATGRID) has been constituted to create an appropriate database of security related information.
- The Multi Agency Centre, which functions under the Intelligence Bureau, was further strengthened and its activities expanded.
- The Navy constituted a Joint Operations Centre to keep vigil over India’s extended coastline.
- **Financial Intelligence Unit-IND (FIU-IND)** is the central national agency responsible for receiving, processing, analysing and disseminating information relating to suspect financial transactions.
- A special **Combating Financing of Terrorism (CFT) Cell** has been created in the Ministry of Home Affairs in 2011, to coordinate with the Central Intelligence/Enforcement Agencies and the State Law Enforcement Agencies for an integrated approach to tackle the problem of terror funding.

**Way forward:**

- Capacities of the state police forces should be increased
- Dealing with the menace of terrorism would require a comprehensive strategy with involvement of different stakeholders, the Government, political parties, security agencies, civil society and media.
- There is a need for National Counter Terrorism Centre. A centrally co-ordinated Terrorism Watch Centre, which could also operate as a think tank with sufficient inputs from academic and private experts.
- A strategy for fighting terror in India has to be evolved in the overall context of a national security strategy. To tackle the menace of terrorism, a multi-pronged approach is needed.
- Socio-economic development is a priority so that vulnerable sections of society do not fall prey to the propaganda of terrorists promising them wealth and equity.
- A more comprehensive approach, as embodied in the proposed Convention on Countering International Terrorism (CCIT) is required in tackling the contemporary form of terrorism.

Conclusion:

Counter-terrorism is a national security issue and political parties must resist the attempts at politicizing them. Such policies only serve to sharpen public fears. Effective counter-terrorism requires a more comprehensive strategy. It requires a constant process of evaluation and adjustment – Israel does not have all the answers and relies on trial and error for different contexts.

Various Security forces and agencies and their mandate.

Discuss the framework of the security forces in India. List the security agencies in India and their respective mandates.(250 words)

[The hindu Reference](#)

Why this question:

The article highlights the attempt that is underway to shift the operational control of Assam Rifles from the Army to the Home Ministry.

Key demand of the question:

The question is straightforward and one must discuss in detail the framework of the security forces in India.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:**Introduction:**

In brief narrate the internal security scenario of the country.

Body:

Provide for a detailed overview of the system works, straightaway list the security agencies in India and their respective mandates.

Explain that there are external and internal threats to security of India and different specialized forces of India deal with these threats. The external threats are handled often by the Armed Forces under the Ministry of Defence, while internal threats are managed by the Ministry of Home Affairs.

Conclusion:

Conclude with their significance.

Introduction:

Reports suggest that an attempt is under way to shift the operational control of Assam Rifles from the Army to the Home Ministry. Having failed to convince the discerning political leaders, the current effort is to hijack Assam Rifles by transferring its full control to the Home Ministry, and replace Army officers with police officers.

Body:

In 2009, the draft Cabinet note for the Cabinet Committee on Security (CCS) was moved to amalgamate the Assam Rifles, a paramilitary force, with the Indo-Tibetan Border Police (ITBP), a Central Armed Police Force, and provide leadership from the police, replacing military leadership. This proposal was turned down by the CCS, understandably recognising the importance of the history and traditions of Assam Rifles, and the crucial role it continues to play in the security of the Northeast region.

Home grown challenges and threats from across international borders have taken different shapes, be it ethnic insurgency, militancy or terrorism that have weakened and damaged the nation.

Central Armed Police Forces: There are many divisions of Central Armed Police Force, which deal with internal threats.

- **Assam Rifles (AR):** The Assam Rifles contribution towards assimilation of the people of the North-East into the national mainstream is truly monumental. They perform many roles including the provision of internal security under the control of the army through the conduct of counter insurgency and border security operations, provision of aid to the civil power in times of emergency, and the provision of communications, medical assistance and education in remote areas.
- **Border Security Force (BSF):** Its operational responsibility is spread over 6385.36 kms. of international border along Indo-Pakistan, Indo-Bangladesh borders. BSF is also deployed on LoC in J&K under operational control of the Army.
- **Central Industrial Security Force (CISF):** Raised in the year 1969, CISF is presently providing security cover to important installations like space and atomic energy establishments, sea ports, airports, coal mines, steel plants, thermal and hydel power plants, oil and petrochemicals installations, heavy industries, defence establishments, security presses, museums and historical monuments. The charter of CISF has been expanded to provide security cover to VIPs as well as to provide technical consultancy services relating to security and fire protection to industries in public and private sectors.
- **Central Reserve Police Force (CRPF):** The Force is presently handling a wide range of duties covering law and order, counter insurgency, anti-militancy and anti-terrorism operations. The Force plays a key role in assisting States in maintaining public order and countering subversive activities of militant groups.
- **Indo Tibetan Border Police (ITBP):** ITBP plays an important role in organizing the annual Kailash Mansarovar Yatra besides providing assistance in disaster management in the central

and western Himalayan regions. New challenging role that has emerged for ITBP is disaster management as it is the first responder for natural Disaster in Himalayas. ITBP is in the forefront of movement for the preservation of Himalayan environment & ecology.

- **National Security Guard (NSG):** National Security Guard was raised in 1984, following Operation Blue Star and the assassination of Indira Gandhi, “for combating terrorist activities with a view to protect States against internal disturbances”. The primary role of this Force is to combat terrorism in whatever form it may assume in areas where activity of terrorists assumes serious proportions, and the State Police and other Central Police Forces cannot cope up with the situation.
- **Sashastra Seema Bal (SSB):** As a border guarding force and lead intelligence agency (LIA) for Indo-Nepal border and Indo-Bhutan border. To promote sense of security among the people living in the border area. To prevent trans-border crimes and unauthorized entries into or exit from the territory of India. To prevent smuggling and other illegal activities.

Challenges in moving AR from Defence to Home ministry guard:

- The Northeast is the most volatile and insurgency-affected region of India after Kashmir.
- Besides operating from within the region, militants surreptitiously operate from neighbouring countries by exploiting the free movement regime along the India-Myanmar border and inaccessible terrain.
- These borders, though settled, require specialised skills, not just mere policing functions.
- Recently China has brought its frontier troops, including those guarding its border with India, directly under the military command, removing civilian control over them.
- The India-Myanmar border, though manned by Myanmar’s Border Guard Police, is also controlled by Myanmar’s Army for conducting seamless operations against insurgent groups operating against the state.

Way forward:

- A more viable alternative for the Home Ministry would be to look inwards and merge ITBP with the Sashastra Seema Bal to space out the almost continuous high altitude tenures of ITBP personnel.
- Since both are being led by police officers, internal management would be easier.
- It is more prudent to have a specialised counterinsurgency force, which doubles as a reserve for conventional war.
- This is due to its continued functioning, manning and training under the Army with a similar ethos and structure.

Conclusion:

Downgrading Assam Rifles from its present status of paramilitary force by merging a part or whole of it with a Central Armed Police Force will not only impinge on national security but also affect the strength and morale of the force. Shifting Assam Rifles under a cadre which is looking to just create career opportunities places personal interests over national security

SECURE SYNOPSIS

MAINS 2020

GS-III

DECEMBER 2019

Indian Economy and issues relating to planning, mobilization of resources, growth, development and employment.

Economists and experts argue that India is now in classic Stagflation Territory. Analyse. What are the structural policies needed to curb the economic slowdown facing India?

[The Hindu](#)

[The Wire](#)

[The Economic Times](#)

Why this question:

The slowdown is three years in the making and it is now irrefutable that India is in a growth recession.

Key demand of the question:

One has to find the reasons for the economic slowdown facing India and provide the structural measures needed to overcome the same.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Define what is stagflation.

Stagflation, as defined by Princeton economist Alan S. Blinder, is “the simultaneous occurrence of economic stagnation and comparatively high rates of inflation”.

Body:

Discuss the reasons for the economic slowdown.

Provide data to substantiate your views.

According to the National Statistical Office (NSO), the Consumer Food Price Index increased from 5.11% in September 2019 to 7.89% in October 2019. The retail price inflation rate reached an annual high at 4.62%. The government itself has admitted that growth has slowed. The recent NSO estimates of gross domestic product (GDP) for the second quarter of 2019-20 reported a further reduction in the growth rate of GDP to 4.5%, the lowest since 2012-13.

Provide the various structural measures needed to overcome

like Higher liquidity and disposable income, and increased employment; reduction and reform of direct individual and corporate taxes, and indirect taxes. Labour laws also need to be amended to generate employment.

Conclusion:

Conclude with a way forward.

Introduction:

Stagflation, as defined by Princeton economist Alan S. Blinder, is “the simultaneous occurrence of economic stagnation and comparatively high rates of inflation”.

Body:

Economic scenario which point towards stagflation in India:

- According to the National Statistical Office (NSO), the Consumer Food Price Index increased from 5.11% in September 2019 to 7.89% in October 2019.
- The retail price inflation rate reached an annual high at 4.62%. The government itself has admitted that growth has slowed.

- The recent NSO estimates of gross domestic product (GDP) for the second quarter of 2019-20 reported a further reduction in the growth rate of GDP to 4.5%, the lowest since 2012-13.
- India's gross domestic product (GDP) growth has dropped to 4.5% in the July-September quarter of 2019-20, a free fall from the government's ambitious call for a double-digit growth not so long ago.
- The fall has been sudden although not entirely unexpected. In the first quarter of 2016-17, India registered a spectacular GDP growth of 9.4%. Today, it's struggling at a 26-quarter low.

Measures taken by the Government now:

- First it withdrew the super-rich surcharge levied on foreign portfolio investors and then rolled out a series of measures, including corporate tax cut and the proposal to set up a Rs 25,000 crore fund to revive the realty sector.
- The RBI, for its part, has already lowered its benchmark interest rate (repo rate) five times during this calendar year, taking the cumulative cuts to 135 basis points, from 6.5% in January to 5.15% in October, even as the Consumer Price Index (CPI)-based inflation shot.
- To avoid further economic turbulence, the Centre has pressed the pause button on banning single-use plastics as well as the quick replacement of fossil fuel-guzzling automobiles with electric vehicles.

Structural measures needed:

- The Reserve Bank of India (RBI) can quickly increase the amount of cash in the economy.
- Then banks, especially public sector banks, can use that together with interest rate policy to provide easy credit. A larger supply of credit should lead to cheaper credit.
- This will have to be supported by reduction of the administered price of credit, which is the RBI's repo rate.
- There could be hurdles to credit off-take due to fiduciary or prudential reasons, so those need to be tackled. Same for mismatched expectations.
- Higher liquidity and disposable income, and increased employment can pull us out of the quagmire.
- reduction and reform of direct individual and corporate taxes, and indirect taxes.
- Labour laws also need to be amended to generate employment.
- The government needs to hold granular conversations with the private sector.
- A skills and industrial policy which can make full use of an abundant pool of reasonably priced labour

Conclusion:

The current economic slowdown is an outcome of supply-side constraints and not demand-side constraints. We need to produce things that Indians earning minimum wages can afford, so that the aggregate demand will increase.

With successive cuts in the policy rates, the RBI has been sending a signal to the rest of the banking system that the lending rates should come down. However, the monetary policy transmission has been inefficient in India. Discuss. Suggest measures to tackle the issue.

The Hindu

The Hindu

Why this question:

The Monetary Policy Committee of the Reserve Bank of India (RBI) decided to keep the interest rate unchanged at 5.15% in the fifth bimonthly policy review, citing inflation concerns despite economic growth continuing to slow down. All the six members of the MPC voted in favour of keeping the interest rate unchanged.

Key demand of the question:

One must assess the reasons for poor transmission of the monetary policies, the implications of not doing so by the banks and the other measures needed

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly narrate the background of the issue. Between February and August, the RBI cut repo rate from 6.5% to 5.4%. But, the interest rate charged by banks on fresh loans fell just 27% of the amount by which the repo rate came down.

Body:

The answer should cover the following:

Discuss first the role of RBI's Monetary Policy.

Monetary Policy Process and Goals of Monetary policy.

Current issues facing RBI policies.

What needs to be done to address these issues and challenges?

Discuss the role of government policies is also of prime importance in handling such issues.

Conclusion:

Conclude with a way forward.

Introduction:

The monetary policy refers to a regulatory policy whereby the central bank maintains its control over the supply of money to achieve the general economic goals. Since February 2019, the Reserve Bank of India (RBI) has aggressively cut the repo rate. By cutting the repo rate, the RBI has been sending a signal to the rest of the banking system that the lending rates should come down.

The Monetary Policy Committee of the Reserve Bank of India (RBI) decided to keep the interest rate unchanged at 5.15% in the fifth bimonthly policy review (Dec 2019), citing inflation concerns despite economic growth continuing to slow down.

Body:

Monetary policy scenario in India:

- In India, the process of monetary policy transmission is inefficient.
- For example, between February and December, the RBI cut repo rate from 6.5% to 5.15%.
- But, the interest rate charged by banks on fresh loans fell just 27% of the amount by which the repo rate came down.

- Further, RBI has urged banks to link their lending rates to the repo rate

Reasons for policy rate cut:

- Since February, India's economic growth momentum has rapidly decelerated.
- Projections of GDP growth rate have come down.
- A lower interest rate regime is expected to help.
- The main issue is that people are not consuming at a high enough rate.
- At lower interest rates, people are expected to borrow and spend more, the more the money circulates in the economy, the greater would be the economic activity.
- If banks reduce their lending rates, they would also have to reduce their deposit rates.
- This, in turn, will incentivise people to save less and spend more.
- If banks reduce the interest rates on loans, more businesses are likely to be enthused to borrow new loans for investment

Reasons for poor monetary policy transmission:

- Repo rates have little impact on a bank's overall cost of funds.
- Reducing lending rates just because the repo rate has been cut is not feasible for banks.
- This is because, for banks to be viable, there must be a clear difference between the lending rate (charged on loans) and the deposit rate (given on deposits).
- The difference between the two has to be not only positive but also big enough for the bank to make profits.
- Notably, to attract deposits, banks pay a high deposit rate.
- Such deposits make up almost 80% of all banks' funds from which they then lend to borrowers.
- On the other hand, banks borrow a minuscule fraction from the RBI under the repo.
- So even sharply reducing the repo rate does not change the overall cost of funds for the banks.
- In effect, unless banks reduce their deposit rates, they will not be able to reduce their lending rates.
- However, if a bank were to reduce its deposit rates, depositors would shift to a rival bank that pays better interest rates.
- Otherwise, they would park more of their savings in small saving instruments (public provident fund, Sukanya Samriddhi Yojana, etc) that pay much higher interest rates.
- Also, 65% of total deposits are "term" deposits (fixed for a certain duration) and take, on an average, up to 2 years to get repriced at fresh rates.
- So, banks cannot always reduce deposit rates immediately as deposits take longer to get repriced.

- Moreover, if banks are under pressure to reduce the interest rate they charge on new loans, they could possibly push up the interest rates on old loans that allow for such flexibility.

Measures needed:

- Enabling effective monetary transmission would not only increase the credibility of the Central Bank but also help in strengthening the financial structure.
- Impounding of bank money by RBI is too high with 4% cash reserve ratio carrying no return whatsoever.
- To make transmission work, the least the RBI can do is to reduce CRR.
- Timely transmission of policy rates could be considerably improved if the banking sector's non-performing assets (NPAs) are resolved more quickly and efficiently.
- If the government wants to reduce lending rates, it could focus on bringing down its own fiscal deficit and public sector borrowing.
- At the current low levels of per capita income, the savers are far more risk-averse in India and unwilling to invest in higher-risk instruments other than bank deposits.
- For a repo-linked regime to work, the whole banking system in India would have to shift to that.
- In other words, along with banks' lending rates, their deposit rates too must go up and down with the repo.

Imports from China have curbed capacity creation and utilization over time. Do you think India's bane is its non-competitiveness? Analyse with relevant illustrations. (250 words).

Business Line

Why this question:

The question seeks to examine the levels of competitiveness India stands at owing to competition from China.

Key demand of the question:

One must examine closely the effects of Chinese market flooding Indian markets and in what way it has curbed capacity creation and utilization over time.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Explain the context of the question in brief.

Body:

Discuss the following aspects in the answer body:

Explain the relevance of competitiveness in general to an economy of a country.

Highlight the current trends in the world; discuss how the strategies of one country affect the other.

Discuss the case of India and China.

Take hints from the article and illustrate relevantly the context of the answer.

Conclusion:

Conclude with solutions as to what should India do to overcome these challenges.

Introduction:

Bilateral trade between India and China increased from USD 38 billion in 2007-08 to USD 89.6 billion in 2017-18. While imports from China increased by USD 50 billion, exports increased by USD 2.5 billion during the same period. This has widened India's trade deficit. Trade with China constitutes more than 40% of India's total trade deficit. Government of India has been taking continuous and sustained steps to bridge trade deficit by lowering the trade barriers for Indian exports to China.

Body:

Relevance of competitiveness to an economy of a country:

- Foreign Trade is the important factor in economic development in any nation.
- International trade is a crucial part of development strategy and it can be an effective mechanism of financial growth, job opportunities and poverty reduction in an economy.
- According to Traditional Pattern of development, resources are transferred from the agricultural to the manufacturing sector and then into services.

Case study of India's non-competitiveness:

Why is India lagging behind in ready-made garment exports? This is one sector where India has had a traditional advantage, and should have raced ahead, due to the low-cost space vacated by China. India is capable of investing in modern machinery and automation, as also in skilling its personnel, just like its competitors. But Bangladesh and Vietnam have now outpaced India even in absolute, not just relative, terms. Of course, a country like Bangladesh has greater labour flexibility, and allows three shifts even with women, who now dominate the garment sector in that country. It may be argued that Bangladesh has special duty-free access to the US and EU, accorded to low-income countries. Even then, however, it does not explain India's lacklustre performance.

India's bane is its non-competitiveness:

- India's competitiveness in the labour intensive export sectors has been on a declining path in the last decade and needs significant structural reforms that need to be addressed
- The **rigidity in labour laws, challenges associated with land acquisition, inadequate physical infrastructure (roads, ports and electricity), and poorly skilled manpower** have held back manufacturing sector growth
- The **limited diversification of India's export basket**, with the top 10 principal exports in terms of commodity groups accounting for as much as 78 per cent of total merchandise exports.
- In recent times the export performance of some of these goods has either deteriorated or been characterised by a lack of dynamism.
- Thus, for example, four of India's lead exports (Engineering goods, Gems and jewellery, chemicals and readymade garments) registered negative or near zero growth rates during 2015-16.
- The **absence of product patents** till the revision of the patent law in 2005 had helped India build the capability to manufacture of generic drugs that are substitutes for more expensive branded products.

- the industry had found a foothold in the patent-expired, generic drug market that accounts for around a third of the \$1 trillion plus global market for pharmaceutical products. This was reflected in high export growth figures, but those growth rates have collapsed more recently.
- in recent years, special circumstances have not only affected exports of some commodities, but because of the **low value on average of India's export trade**, allowed these 'special category' goods to find a slot among India's principal exports for a brief period. Typical examples are iron ore, rice and petroleum products

Way forward:

- India needs to take a hard look at its choices. India must move fast to renew its stalled trade negotiations with the European Union, RCEP etc.
- There is a need to focus on labour-intensive exports such as agriculture, textiles, footwear and tourism
- The **revealed comparative advantage (RCA)**, a measure of international competitiveness, for some of India's key export items has declined in the past decade should be increased as Most of these sectors have large employment multipliers.
- Creating global competitiveness and doing all that it takes to do so, including abandoning conventional ways of thinking, cannot be delayed.
- Better-functioning factor markets and reducing costs for businesses are overdue.
- Smarter, creative policies for developing and nurturing the nation's industrial and technological capacities need to be crafted.
- We must shun product- and market-specific incentives (which run afoul of World Trade Organization rules), but focus on regional or cluster subsidies, which benefit all producers, small or large, domestic or export oriented.
- steps including improving purchasing power across the board, bringing out favourable tax policies for the middle class, increasing investment and attracting FDI as well as maintaining global competitiveness.
- Economic nationalism and greater ambition is the need of the hour.
- Lastly, we should be committed to open borders, notwithstanding the pressure to raise trade barriers. It is not by protection that domestic industry will become world leaders in competitiveness. And that's an absolute prerequisite to winning in world markets.

Tourism has the potential to be one of the main pillars of India's economy. Examine. (250 words)

The Hindu

Why this question:

As the fourth largest city in the Tamilnadu, Tiruchi — projecting a fine blend of tradition and modernity — serves as a good base for visitors' keen on exploring tourist destinations in central Tamil Nadu. Yet a lot of potential has been left untapped, rue a section of stakeholders in tourism and travel industry.

Key demand of the question:

The question expects us to highlight the potential of tourism sector in India, the shortcomings in

the sector, the steps that India needs to take to boost tourism in the country. Finally, we need to mention the impact of focussing on tourism sector in India.

Directive word

Examine – When asked to ‘Examine’, we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer

Introduction:

Mention that there was a marginal growth of 5.6% in Foreign Tourist Arrivals (FTAs) during the period January-November 2018, as compared to the same period of the previous year. India's Tourism is ranked at 7th position in terms of its contribution to World GDP in World Travel and Tourism Council's report in 2017.

Body:

Discuss the status of tourism in India. Give facts and figures related to revenue and forex earnings, tourist footfalls. Also highlight the diverse nature of tourist circuits in the country. Highlight the areas where work is needed – security, infrastructure, connectivity and so on. give details of these three aspects

Mention the steps taken by the government in improving the aforementioned areas through schemes and programmes like PRASAD, e tourist visa etc.

Discuss the steps that need to be taken still to fill in the gaps

Conclusion:

Give your view on the potential of tourism sector in India and the impact it can have.

Introduction:

India is a large market for travel and tourism. It offers a diverse portfolio of niche tourism products – cruises, adventure, medical, wellness, sports, MICE, eco-tourism, film, rural and religious tourism. India has been recognized as a destination for spiritual tourism for domestic and international tourists.

Travel and tourism industry contributed a tenth of India's GDP in 2018 and accounts for 42 million jobs in the country, report says. In India, over Rs 16 trillion were created by this sector alone. The same is expected to double by 2029, reaching Rs 35 trillion mark. Also, the industry has given a major boost to the global economy as well with it contributing over 10% to the global GDP.

Body:

India's Tourism Industry:

- Currently India is the seventh largest tourism industry.
- 29 states, 4000 cities, rich history, incredible diversity
- India all set to become third largest in next 10 years.
- Tourism contribution to economy to double
- Expected to add 5.23 crore jobs in 2028
- India doing well in medical tourism, business tourism, ecological tourism, pilgrimage tourism, historical tourism, adventure tourism.

Tourism has the potential to be one of the main pillars of India's economy:

**Reasons why rural tourism need to be promoted:**

- Seeing the stressful urban lifestyles leading towards “counter-urbanization” syndrome
- Growing curiosity of urban people regarding rural culture and heritages
- Downfall of income level from agriculture and related works
- Lack of alternative way outs for earning sufficient money
- Scope for new business opportunities
- Changing attitude in Indian and global tourists behaviour in terms of nature awareness and increasing demand for niche tourism and green products. So it is evident that the future of Rural Tourism in India is going to be very promising one.

Maintaining the sustainable livelihood:

- It has a great impact in case of maintaining the sustainable livelihood of the rural population, promoting local culture and heritages, empowering local women, alleviating poverty, conserving and preserving natural resources, improving basic rural infrastructure, adopting new work culture and overall developing a better impression of locality and its people in tourists’ mind.

Reduces migration:

- Tourism facilitates the declining areas to be developed with basic infrastructure facilities and provides the host community alternative ways of employment and side by side it reduces out-migration.
- It fosters a closer relationship between city dwellers and rural communities.

Alternative Way of Earning:

- Tourism can be a potential tool to reduce over-dependency on cultivation especially in rural areas and it contributes to the overall economic development of an area that would otherwise be deprived.

Employment:

- Tourism creates a large number of semi-skilled jobs for the local population in not only local hotels and catering trades but also in other fields like transport, retailing, heritage interpretation etc.
- Moreover, it ensures revival of traditional arts, crafts, building art etc. and brings marketing opportunity for rural producers to sell their products directly to the tourists.
- It allows alternative sources of earning opportunities from non-agricultural sectors that improve living standards of the rural dwellers to some extent.

Job Retention:

- Cash flows generating from rural tourism can assist job retention in services such as retailing, transport, hospitality, medical care etc. It provides additional income for farmers, local fishermen and local suppliers
- Alternative Business Opportunities

- Tourism generates new business opportunities through developing close relationships with tourist facilities.
- For example, a number of tourists love to taste local cuisines of different tourist spots. Therefore, any restaurant serving ethnic foods can also attract tourists though many of these restaurants are not directly related to tourism business.

Poverty Alleviation:

- Rural Tourism is being admired all over the world because such form of tourism can shape up rural society both by economic and social terms.
- It brings both monetary and social benefits to the rural people.
- It alleviates poverty by creating alternative sources of earning.

Empowerment of Localities

- Tourism cannot be flourished without the involvement of local people in it.
- Accommodation facilities are being provided by local hotel owners whereas local suppliers supply food and beverages to the local hotels.
- Local producers produce locally made products as per tourists' demand and earn money by selling them in the local market.
- To entertain tourists, local organizers conduct different cultural programmes where local performers exhibit their art and culture through live performance.
- Not only that, people also become engaged in different decision-making processes. All such engagement actually empowers the localities.

Entrepreneurial scope:

- Tourism has increased career options for the young entrepreneurs.

Arts and Crafts Sale:

- Arts and crafts are the evidence of local culture and heritages of a community belonging from any region or any nation. The urban tourists, wherever they go, generally prefer to have a collection of local arts and crafts to make their trip-experience a remembering one.
- Such tendency motivates them to purchase local arts and crafts from the local producers and artists.
- Side by side it encourages the local community to sell their products in local market. Such practice opens an alternative way of earning to the rural people.

Environmental Improvement:

- Environmental improvements such as village paving and traffic regulation schemes, sewage and litter disposal can be assisted by tourism revenues and political pressures from tourism authorities.
- These help develop pride of place, important in retaining existing population and businesses, and in attracting new enterprises and families.

**Heritage Preservation:**

- Tourism brings a strong sense of emotion in everyone's (both community and tourists) mind to preserve and reserve the local culture and heritages to make any place attractive for the tourists to visit it and also for the host community to live in.
- Such sense is maintained through rural museums that play a significant role in local heritage preservation.

Source of Foreign Exchange Earnings:

- Tourism is an important source of foreign exchange earnings in India. This has favourable impact on the balance of payment of the country.
- The tourism industry in India generated about US\$100 billion in 2008 and that is expected to increase to US\$275.5 billion by 2018 at a 9.4% annual growth rate.

Challenges tourism industry faces:

- **Communication Skill:** The difference in languages and lack of basic education are the two basic obstacles.
- **Legislation Problem:** Generally, owners of licensed accommodation units pay taxes to the government. But it is kind of burden for the poor rural marketers to pay tax at a regular basis as they lack sufficient financial backing and many a time they face losses in business because of seasonal demand.
- **Insufficient Financial Support:** Most of the tourism marketers especially in rural areas come from the poor family background and not every time they are financially supported by the local banks or local government bodies through loan facilities.
- **Lack of Trained Human Resource:** Lack of trained human resource is a common issue that affects directly the tourism and hospitality industry badly. Moreover, the trained people from urban areas normally are not interested in going to rural areas to work due to lack of basic infrastructure facilities.
- **Lack of Proper Physical Communications:** Proper drinking water, sufficient electricity, good telecommunication, safety and security, etc. are the few basic needs of a tourist while he or she is visiting any place individually or in a group. It is unfortunate but true that nearly half of the villages in this country do not have all- weather roads and above said basic facilities.
- **Deprivation, Improper Communication Facilities and Embryonic Stage of Rural Market:**
 - Markets are often characterized by population and majority of them still come under below Poverty Line. These villagers are less involved in showcasing their culture and heritages in front of the tourists visiting their places as they are not very much aware of the potentiality of rural tourism that can act as an alternative source of earning
 - Moreover, most of the rural markets are underdeveloped with lots of hindrances like absence of proper mode of surface transportation, lack of basic infrastructure etc.

Steps to promote Tourism:

- Atithi Devo Bhavah Campaign

- Incredible India Campaign
- Swadesh Darshan Scheme
- PRASAD
- Reforms in Visa process
- Online option of applying for tourist visa
- E-visa facility available to citizens of 163 countries
- India ranks 8th among 100 countries on most valuable nation brands list

Way forward:

- Government should educate people to enhance their communication skill, create sense of ownership, make them aware of the value of their culture and heritages and motivate them to take active participation
- Encouraging local entrepreneurs, private enterprises, investors and other tourism stakeholders to come under a common umbrella for basic rural infrastructure development activities is also essential.
- Product development as per tourists changing demands.
- Proper planning and conservation of natural resources and local heritages for the sustainable development of Tourism.
- Educate the people and develop their communication skill and language proficiency.
- Creating awareness regarding rural tourism benefits.
- Democratic movement that helps rural people at all levels to participate in tourism development activities.
- Conduct regular Government and/or private sponsored skill development programmes in identified rural area to train the rural people appointed in tourism business.
- Encourage young and potential business entrepreneurs for their businesses.
- Government initiatives to support the young entrepreneurs by providing loans.
- FDI or Private investment to introduces latest technology.
- Taking Tourism Circuit development approach for overall regional development.
- Take necessary safety and security measures for the tourists.
- Share information to make better business decisions.
- Any museum or interpretation centre can be set-up to provide information to tourists.

As the years rolled by the “Twin Balance Sheet problem” morphed into a “four balance sheet challenge” — comprising banks, infrastructure, plus NBFCs and real estate companies — for the economy. Discuss. (250 words)

Indian Express
Economic Time

Hindustan Times

Why this question:

India is facing a “Great Slowdown” with its economy headed for intensive care unit primarily due to a “second wave” of the twin balance sheet crisis at banks, former Chief Economic Adviser Arvind Subramanian has said. In a new working paper published by Harvard University’s Center for International Development last week, Arvind Subramanian, who was India’s chief economic advisor between October 2014 and August 2018, and Josh Felman, former IMF resident representative to India, give a detailed understanding of how the Indian economy lost its way.

Key demand of the question:

The question is in the backdrop of India’s Great Economic Slowdown. One must provide the details for the economic slowdown and how the twin-balance sheet is now a four-balance sheet problem. Provide measures to tackle the issue.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer

Introduction:

In brief explain what the economic slowdown in India. TBS-1 was about bank loans made to steel, power, and infrastructure sector companies during the investment boom of 2004-11 turning bad. TBS-2 is largely a post-demonetization phenomenon, involving non-banking financial companies (NBFCs) and real estate firms.

Body:

Explain about the twin-balance sheet syndrome.

Now move on to discuss the reasons for the TBS to become four balance sheet challenge

Since the Global Financial Crisis, India’s long-term growth has slowed as the two engines propelling rapid growth — investment and exports — sputtered.

Today, the other engine — consumption — has also stalled. As a result, growth has plummeted precipitously over the past few quarters

Dwelling into the current problem facing the economy, he said, after demonetization, considerable amounts of cash made their way to banks, who on-lent a major part of that to NBFCs. The NBFCs, in turn, channelled this money to the real estate sector. By 2017-18, NBFCs were accounting for roughly half of the estimated Rs 5 lakh crore of outstanding real estate loans.

The collapse of IL&FS in September 2018 was a “seismic event” not only because of the Rs 90,000 crore-plus debts of the infrastructure-cum-lending behemoth, but also its “prompting markets to wake up and reassess the entire NBFC sector

Provide measures to tackle it.

Conclusion:

Conclude by suggesting what should be the way forward.

Introduction:

India is facing a “Great Slowdown” with its economy headed for intensive care unit primarily due to a “second wave” of the twin balance sheet crisis at banks, former Chief Economic Adviser Arvind Subramanian has said. In a new working paper published by Harvard University’s Center for International Development last week, Arvind Subramanian, who was India’s chief economic advisor between October 2014 and August 2018, and Josh Felman, former IMF resident representative to India, give a detailed understanding of how the Indian economy lost its way. TBS-1 was about bank loans made to steel, power, and infrastructure sector companies during the investment boom of 2004-11 turning bad. TBS-2 is largely a post-demonetization phenomenon, involving non-banking financial companies (NBFCs) and real estate firms.

**Body:**

According to the paper, Indian economy is facing both **structural** (that is, more long-term issues related to the overall framework of the economy such as the flexibility or inflexibility of labour laws etc.) and **cyclical** (that is, more short-term issues such as a bad monsoon that disrupts production of food articles etc.) **challenges**.

Twin-balance sheet problem:

- In the Economic Survey of 2017-18 that the economy was facing a TBS problem. The two balance sheets he referred to belonged to **the Indian banks** (especially public sector banks or the government-owned banks) and the **corporate sector**, respectively.
- The balance sheets of Indian banks were burdened by a high proportion of non-performing loans and the balance sheet of corporates were clogged because they had over-borrowed and were unable to pay.
- The origins of India's TBS was traced to the economic boom that happened between 2005 and 2009.
- This was a period when economic prospects were rosy and the economy was growing at near double-digit growth rates.
- As such, companies threw caution to the wind and borrowed heavily in the hope of making profits in the future.
- The banks, especially the government-owned ones, too, ignored prudential norms and lent a lot of money to companies in the hope that this would help boost economic growth.
- The Economic prospects collapsed quite sharply after the Global Financial Crisis (GFC) and a high proportion of companies found that their projects were no longer viable.
- The end result was that the companies were left with huge loans they could not pay back in time and the banks were left with huge loans that had turned duds.
- This essentially meant that neither the Indian companies were in position to invest nor were the Indian banks in a position to lend.

Economy kept going from 2014 to 2018:

- even though the TBS problem remained unsolved yet, thanks to a sharp fall in crude oil prices, Indians experienced an income boost.
- government funded economic activity in the country not directly but indirectly through government backed institutions such as Food Corporation of India and National Highways Authority of India.
- These are called "off-budget" items which should ideally be counted in the fiscal deficit but are not.
- India's growth was boosted by a lending spree provided by non-banking financial companies (NBFCs) like IL&FS and DHFL.
- NBFCs took over the leading role of lending to the economy because banks were still struggling with NPAs and were largely unwilling to lend directly to businesses.

- The credit provided by NBFCs fuelled both private consumption and business investment, and through this route fuelled GDP growth.
- The authors state that these factors papered over the disruptions caused by demonetisation and GST introduction.

Towards “Four Balance Sheet” challenge:

- In short, there are two broad but interlinked reasons. One, the unresolved TBS problem, and two, the fall of NBFCs and the real estate sector. Together, they make for the **Four Balance Sheet Challenge for the Indian economy**.
- even after the introduction of the Insolvency and Bankruptcy Code (IBC) in December 2016. The data shows that the IBC resolution has been much slower than expected. Moreover, the recovery rates are nowhere near what were hoped for.
- while the unresolved TBS problem provided a progressively weakening ecosystem of banks and companies, the collapse of some of the leading NBFCs has proven to be trigger for the sharp growth deceleration.
- ILFS was a behemoth, with Rs. 90,000 crores of debt, so its failure sent shockwaves throughout the financial system.
- The failure was completely unexpected, prompting markets to wake up and re-assess the entire NBFC sector.
- Much of the NBFC lending had been channelled to one particular sector, real estate. And that sector itself was in a precarious situation.
- The real estate story is about builders launching numerous projects since the start of mid-2000s in the hope that these flats would be lapped up.
- But after the Global Financial Crisis, the demand for flats as well as bank funding for builders collapsed.
- The real estate sector was unable to pay back to the NBFCs, which, in turn, starting defaulting.

Measures needed:

- The first major action — almost a pre-condition for righting the economy — could be a **Data Big Bang**, which instil confidence and produce a reliable basis for policy making.
- This must comprise the **publication of unreleased reports together with a strategy for improving official statistics in at least three areas: the real sector** (GDP, consumption, and employment), **fiscal accounts**, and **stressed assets** in the banking system.
- A new asset quality review to cover banks and NBFCs must be conducted.
- Also changes to the Insolvency and Bankruptcy Code (IBC) be made to ensure that participants actually have incentives to solve the problem.
- Creation of two executive-led public sector asset restructuring companies (bad banks), one each for the real estate and power sectors, while at the same time strengthening oversight, especially of NBFCs.

- Recapitalization of banks should be linked to resolution and reforms such as shrinking public sector banking should be undertaken.
- The private final consumption expenditure, or spending by individuals, government spending, private investment and net exports. These engines need a spark in the upcoming Budget to be presented on February 1.

‘Government has no business being in business’. Examine in light of the India’s approach to disinvestment since liberalisation. Analyse whether there is a need to relook at the policy of disinvestment? (250 words)

The Hindu

The Hindu Business Line

Why this question:

Last month, the Cabinet approved sale of the government’s stake in Bharat Petroleum Corporation Limited, a navratna public sector company with oil refining and marketing operations. BPCL’s stake alone is expected to raise about ₹60,000 crore for the exchequer this year, and given the fiscal pressures the government is facing on the tax revenue front, such large-scale disinvestment will help.

Key demand of the question

One needs to examine the India’s path of disinvestment since liberalisation, discuss the macro features of the policy of disinvestment and analyse whether there is a need to have a relook at it.

Directive word

Examine – When asked to ‘Examine’, we have to look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Analyse – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer

Introduction:

In a few introductory lines brief define the disinvestment. Give the context of recent sale of stakes in BPCL.

Body:

The question must discuss the following points:

Present the evolution of disinvestment in India.

Discuss how the disinvestment has fared and loopholes/challenges for disinvestment.

Mention the cases of air India sale, and the hesitant approach in case of IDBI etc. shows the reticence of government towards disinvestment.

Examine whether disinvestment has yielded results. Whether private management can take PSUs to bigger scales.

Also discuss why there is a need to remain cautious with respect to disinvestment and measures to attain the same.

Conclusion:

Give a balanced way forward.

Introduction:

Disinvestment, or divestment, refers to the act of a business or government selling or liquidating an asset or subsidiary or the process of dilution of a government’s stake in a Public Sector Undertaking (PSU). Last month, the Cabinet approved sale of the government’s stake in Bharat Petroleum Corporation Limited, a navratna public sector company with oil refining and marketing operations. BPCL’s stake alone is expected to raise about ₹60,000 crore for the exchequer this year, and given

the fiscal pressures the government is facing on the tax revenue front, such large-scale disinvestment will help.

Body:

India's approach to disinvestment since liberalisation:

- In the **Interim Budget of 1991-92**, it was announced that the Government would disinvest up to 20% of its equity in selected PSEs in favour of mutual funds and financial and institutional investors in public sector.
- In the **Budget speech of 1992-93**, the cap of 20% was reinstated and the list of eligible investors was enlarged to include FIIs, employees and OCBs.
- In April **1993**, the Rangarajan Committee recommended disinvesting up to 49% of PSEs equity for industries explicitly reserved for the public sector and over 74% in other industries. But the then Government did not take any decision on the Committee's recommendations.
- In **1996**, as per the Common Minimum Programme (CMP), the Budget speech of 1996-97 announced the setting up of Disinvestment Commission for 3 years (For more details about the Disinvestment Commission, click here). CMP also emphasized adding more transparency to the disinvestment process and examine the non – core areas of public sector.
- In the **Budget speech of 1998-99**, it was announced that the Government shareholding in CPSEs should be brought down to 26% on case-to-case basis, excluding strategic CPSEs where the Government would retain majority shareholding. The interest of workers was to be protected in all the cases. For this purpose, on 16 March 1999, the Government classified the PSEs into Strategic and Non-Strategic areas. It was decided that Strategic PSEs would be those in areas of:
 - Arms and ammunition and allied items of defence equipment, defence aircraft and warships
 - Atomic energy (except in the areas related to the generation of nuclear power and applications of radiation and radio-isotopes to agriculture, medicine and non-strategic industries)
 - Railway transport
 - All other PSEs were to be considered Non-Strategic.
- In the **Budget speech of 1999-2000**, it was announced that the Government would continue to strengthen the Strategic units and “privatizing” the Non-Strategic ones through gradual disinvestment or strategic sale and devise viable rehabilitation strategies for weak units.
- **The 2000-01 Budget speech** focused on restructuring and revival of viable CPSEs, closure of PSEs which cannot be revived; bringing down Government shareholdings in Non-Strategic CPSEs to 26% or lower, if necessary, and protection of the interest of workers. The receipts from disinvestment would be used for the social sector, restructuring of CPSEs and for retirement of public debt.

- In the suo motu statement of **2002**, specific aim was given to the Disinvestment Policy- modernization and upgradation of PSEs, creation of new assets, generation of employment and retiring of public debt.
- In the **Budget speech of 2003-04**, the Government announced details regarding the setting up of Disinvestment Fund and Asset Management Company to hold, manage and dispose the residual holdings of Government.
- In **2004**, with the change in the Government, there was a change in the outlook of Disinvestment Policy.
- In **2005**, the government formed a National Investment Fund or NIF, to which the proceeds of disinvestment were channelled. The mandate of the Fund, managed by professional investment managers, was to utilise 75% of annual funds in social sector schemes to promote education, health and employment.
- But with the **economic slowdown of 2008-09**, and later a drought, this was waived for three years — and later, in **2013**, restructured to provide flexibility in using the Fund.
- The NDA government has enjoyed the best of market conditions, with equities soaring in its first year, but like many previous governments, is yet to carry out asset sales consistently over a fiscal year — pushing it till the end, with resultant impact on valuation and proceeds.

India's current disinvestment policy (2014 onwards):

- Public Sector Undertakings are the wealth of the Nation and to ensure this wealth rests in the hands of the people, promote public ownership of CPSEs
- While pursuing disinvestment through minority stake sale in listed CPSEs, the Government will retain majority shareholding, i.e. at least 51 per cent of the shareholding and management control of the Public Sector Undertakings
- Strategic disinvestment by way of sale of substantial portion of Government shareholding in identified CPSEs upto 50 per cent or more, along with transfer of management control.

Outcome of disinvestment policy:

- While strategic sale deals in the past have seen a few mis-steps, they've also yielded convincing success stories like Hindustan Zinc's, which has seen a hundred-fold increase in its profits on the back of a six-fold expansion in capacities, since its takeover by Vedanta in 2002.

Need to relook at the policy of disinvestment:

- Government has mostly used disinvestment for fiscal reasons rather than growth objectives.
- Process of disinvestment is not favoured socially as it is against the interests of socially disadvantaged people.
- Loss making units don't attract investment so easily.
- Over the years the policy of divestment has increasingly become a tool to raise resources to cover the fiscal deficit with little focus on market discipline or strategic objective.

- Government presence in non-strategic sectors not only distorts competitive dynamics for private players, it also results in consumers and taxpayers bearing the brunt of inefficient PSU operations.
- Sometimes with the emergence of private monopolies consumer welfare will be reduced.
- Mere change of ownership from public to private does not ensure higher efficiency and productivity.
- It may lead to retrenchment of workers who will be deprived of the means of their livelihood.
- Private sector governed as they are by profit motive has a tendency to use capital intensive techniques which will worsen unemployment problem in India.

Way forward:

- Define the priority sectors for the government based on its strategic interests.
- Investment in PSU's has to be in terms of generation of adequate social and strategic returns.
- Financial return cannot be the sole reason for investment in PSUs. They have to serve social/strategic purposes. The key role of a PSU is to maintain competition in the sector and limit excessive monopoly.
- Government ownership is required for sectors with strategic relevance such as defence, natural resources, etc. The government should, therefore, exit non-strategic sectors such as hotels, soaps, airlines, travel agencies and the manufacture and sale of alcohol.
- The outlook towards strategic divestment should move from the current policy of emphasizing on public ownership and retaining majority shareholding to looking at the strategic interest.
- It is important to realize that ownership is not a substitute for regulation. Therefore, instead of creating PSUs in non-priority sectors, the government should look into strengthening the regulatory framework that ensures efficient market conditions. The regulations should also ensure that the basic necessities of the consumers are met.

Stagflation is said to happen when an economy faces stagnant growth as well as persistently high inflation. Is India facing stagflation? Analyse with suitable justifications for your answer. (250 words)

Indian Express

Why this question:

Last week, Finance Minister Nirmala Sitharaman refused to comment on queries on stagflation. But with fast decelerating economic growth and sharply rising inflation, there is a growing murmur about India facing stagflation.

Key demand of the question:

One has to analyse the context of Stagflation currently witnessing the Indian economy.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

In first define what stagflation is – Stagflation is a portmanteau of stagnant growth and rising inflation. Typically, inflation rises when the economy is growing fast.

Body:

Explain the concept of stagflation in detail.

Discuss the past experiences of stagflation in the Indian economy; The most famous case of stagflation happened in the early and mid-1970s when OPEC (The Organization of Petroleum Exporting Countries), which works like a cartel, decided to cut supply and sent oil prices soaring across the world. On the one hand, the rise in oil prices constrained the productive capacity of most western economies that heavily depended on oil, thus hampering economic growth.

Discuss what needs to be done.

Conclusion: *Conclude with way forward.*

Introduction:

Stagflation, as defined by Princeton economist **Alan S. Blinder**, is “the simultaneous occurrence of economic stagnation and comparatively high rates of inflation”. It is said to happen when an economy faces stagnant growth as well as persistently high inflation

Body:

Stagflation:

- Stagflation is a portmanteau of stagnant growth and rising inflation.
- Typically, inflation rises when the economy is growing fast.
- That’s because people are earning more and more money and are capable of paying higher prices for the same quantity of goods.
- When the economy stalls, inflation tends to dip as well – again because there is less money now chasing the same quantity of goods.
- Stagflation is said to happen when an economy faces stagnant growth as well as persistently high inflation.
- That’s because with stalled economic growth, unemployment tends to rise and existing incomes do not rise fast enough and yet, people have to contend with rising inflation.
- So people find themselves pressurised from both sides as their purchasing power is reduced.

Current economic scenario in India:

- According to the National Statistical Office (NSO), the Consumer Food Price Index increased from 5.11% in September 2019 to 7.89% in October 2019.
- The retail price inflation rate reached an annual high at 4.62%. The government itself has admitted that growth has slowed.
- Over the past 6 quarters, economic growth in India has decelerated with every quarter.
- The recent NSO estimates of gross domestic product (GDP) for the second quarter of 2019-20 reported a further reduction in the growth rate of GDP to 4.5%, the lowest since 2012-13.

- India's gross domestic product (GDP) growth has dropped to 4.5% in the July-September quarter of 2019-20, a free fall from the government's ambitious call for a double-digit growth not so long ago.
- The fall has been sudden although not entirely unexpected. In the first quarter of 2016-17, India registered a spectacular GDP growth of 9.4%. Today, it's struggling at a 26-quarter low
- Inflation for the rest of the financial year is expected to stay above the RBI's comfort level of 4%.
- So, with growth decelerating every quarter and now inflation rising up every month, there are growing concerns of stagflation in India

Indian economy and stagflation:

- Although it appears so at the first glance, India is not yet facing stagflation.
- India is not growing as fast as it had in the past or as fast as it could.
- However, it is still growing at 5%, and is expected to grow faster in the coming years.
- India's growth has not yet stalled and declined.
- In other words, year on year, India's GDP has grown in absolute number, not declined.
- However, it is true that retail inflation has been quite high in the past few months.
- But, the reason for this spike is only temporary.
- It has been caused by a spurt in agricultural commodities after some unseasonal rains.
- So, with better food management, food inflation is expected to come down.
- The core inflation (inflation without taking into account food and fuel) is still in the safe zone.
- Moreover, retail inflation has been well within the RBI's target level of 4% for most of the year.
- So, a sudden spike of a few months, which is likely to flatten out in the next few months, is a premature criterion for the stagflation claims or concerns.

Measures taken by the Government now:

- First it withdrew the super-rich surcharge levied on foreign portfolio investors and then rolled out a series of measures, including corporate tax cut and the proposal to set up a Rs 25,000 crore fund to revive the realty sector.
- The RBI, for its part, has already lowered its benchmark interest rate (repo rate) five times during this calendar year, taking the cumulative cuts to 135 basis points, from 6.5% in January to 5.15% in October, even as the Consumer Price Index (CPI)-based inflation shot.
- To avoid further economic turbulence, the Centre has pressed the pause button on banning single-use plastics as well as the quick replacement of fossil fuel-guzzling automobiles with electric vehicles.

Structural measures needed:

- The Reserve Bank of India (RBI) can quickly increase the amount of cash in the economy.
- Then banks, especially public sector banks, can use that together with interest rate policy to provide easy credit. A larger supply of credit should lead to cheaper credit.
- This will have to be supported by reduction of the administered price of credit, which is the RBI's repo rate.
- There could be hurdles to credit off-take due to fiduciary or prudential reasons, so those need to be tackled. Same for mismatched expectations.
- Higher liquidity and disposable income, and increased employment can pull us out of the quagmire.
- reduction and reform of direct individual and corporate taxes, and indirect taxes.
- Labour laws also need to be amended to generate employment.
- The government needs to hold granular conversations with the private sector.
- A skills and industrial policy which can make full use of an abundant pool of reasonably priced labour

Conclusion:

The current economic slowdown is an outcome of supply-side constraints and not demand-side constraints. We need to produce things that Indians earning minimum wages can afford, so that the aggregate demand will increase.

Time has come to have a re-look at the whole policy for Dairy sector and move from white revolution 2.0 to 3.0 and device steps so that the interests of the Indian farmers and consumers are protected. Elucidate in the backdrop of the statement where in unveiling White Revolution 2.0 is projected to amalgamate the milk production in the country and make India as a global leader. (250 words)

Financial Express

Why this question:

Niti Aayog estimates that the country is expected to increase its milk production to 330 million metric tonnes (mt) in 2033–34 from the current level of 176 mt.

Thus the question aims to analyse the prospects of white revolution 3.0 in the country.

Key demand of the question:

One must discuss the prospects and future of the Dairy sector and the possibility of moving forward to white revolution 3.0.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In 2019, India emerged as the largest milk producer and consumer. Discuss the facts brought out by the NITI Aayog.

Body:

Explain the prospects of white revolution in the country.

Bring out the transition from past to present.

Explain the key features of white revolution 2.0 and discuss in detail how India can move forward to white revolution 3.0.

Discuss the possible challenges and how they can be addressed.

Conclusion:

Conclude with way forward.

Introduction:

The huge increase in milk supply through concerted efforts on a cooperative level is known as the **White Revolution**. Forty-eight years after **Operation Flood** – that made India the world's largest milk producer – India continues to be on the lookout for the next breakthrough in agricultural produce and productivity. White Revolution 2.0 has effectuated dairy firms' marketing strategy for milk and milk products, resuscitating the outlook of product-market mix.

Body:

Milk production in India:

- India emerged as the largest milk producer and consumer in 2019.
- Niti Aayog estimates that the country is expected to increase its milk production to 330 million metric tonnes (mt) in 2033–34 from the current level of 176 mt.
- Currently India has 17% of world output of dairy products, surpassing USA in 1998 as world's largest producer of dairy. All this was achieved by operation Flood which was launched in 1970's.
- According to market research company IMARC, the milk and dairy products industry reached Rs7.9 lakh crore in 2017.
- In 2016, the milk sector alone was valued at Rs3 lakh crore and is projected to scale Rs7.3 lakh crore by 2021.
- The per capita milk availability in India has gone up from 126 gm per day in 1960 to 359 gm per day in 2015.

Potential of White Revolution 2.0:

- Post-liberalisation and Milk and Milk Products Order (2002) was abolished, dairy businesses observed a radical shift toward a strategic product diversification towards functional and traceable foods like nutrition-based health drinks, packaged milk products (such as paneer), and frozen/probiotic products and so on.
- Market structure, conduct, and performance has dramatically changed post 2000s. Besides the established cooperative federations like Amul, other state cooperative federations and multinationals (namely, Nestle, Danon, and Lactalis) are aggressively harnessing the untapped business potential.
- White revolution 2.0 can strengthen the scope of vertical integration between cattle feed industries, dairy machinery firms, producer cooperatives unions, state marketing federations, advertising and marketing firms, logistics and distribution agencies.

- The dairy industry in India is unique. With six lakh villages housing about 90 crore people, dairying is not just a large economic activity but also an integral part of our social and cultural heritage
- Can help small farmers to reduce dependence on crop sales
- Can increase source of income of farmers in low yielding areas like Marathwada, Bundelkhand etc
- India is surrounded by countries and regions that are milk-deficient, such as the Middle East, South Asia and Southeast Asia.
- There is ample scope for export of value-added milk products to Bangladesh, China, Singapore, Thailand, Malaysia, Philippines, Japan, the UAE, Oman and other gulf countries, all of which are located close to India.
- At present, the population of South Asia alone is growing at 1.3 per cent a year; it is likely to be 2.2 billion by 2050. This presents an opportunity for India's dairy industry

Challenges to White Revolution 2.0:

- The Indian cows and buffaloes are generally low yielding and non-descript because of the lack of healthy cattle-feed and fodder, tropical heat and diseases.
- Despite lack of water and gradually declining arable land, dairy farming is on the rise.
- Free trade agreements, or FTAs, for instance, will allow EU government-subsidised products to be imported from Europe with little entry barriers. This will pose a big challenge to cow-farmers.
- Due to unhygienic production, handling conditions and high temperatures, the quality of milk is adversely affected.
- Because of inadequate marketing facilities, most of the marketable surplus is sold in the form of ghee which is the least remunerative of all milk products.

Measures needed:

- Increase in the market share depends on how dairy firms' capabilities and their resources are utilised given the opportunities and threats emanating from emerging markets economies.
- Contract/corporate dairying and emerging global dairy trade are required to rope in dairy supply chains stakeholders in order to expand their outreach and "on-the-go" product positioning into the target segment.
- Digital technology-enabled dairy firms need to identify their compatible partners and competitors for co-creation through product-process innovation via relationship/value-based marketing.
- Freshness in milk, and convenience to store milk or milk products can be a technology innovation brought in by large dairy firms in association start-ups.
- Education and Training at Panchayat level for small and medium size farmers
- Subsidizing cattle production and encouraging cattle markets

- Facility of logistics for produced milk
- Improved Veterinary facility specially in artificial insemination of cattle
- Encouraging private sector firm to procure dairy produced at rural level
- Low interest loans for small and medium scale farmers for cattle purchase
- Encouraging rural women to take up animal husbandry
- Insurance of cattle against diseases like Anthrax, Foot and Mouth, Peste des Ruminantes, etc.
- Nurture dairy entrepreneurs through effective training of youth at the village level coupled with dedicated leadership and professional management of farmers' institutions.
- Agricultural practices, sanitation, quality of drinking water & fodder, type and quality of pipelines – all of these need to be aligned to the goal of healthy milk

India Post will have to shed its half-hearted attempts to transform itself into a payments bank if it wants to convert itself into a digitally enabled, pure deposit-taking bank.

Discuss in detail the issues faced by India post and suggest way forward. (250 words)

The Hindu

Why this question:

The article explains that If India Post can shed its half-hearted attempts to transform itself into a payments bank and convert itself into a digitally enabled, pure deposit-taking bank; it can render a yeoman service both to the government and small savers of this country.

Key demand of the question:

One must explain the trends that have recently witnessed in the Indian post and the challenges it has been facing. Also suggest solutions to address the same.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Explain the current case – The confidence that ordinary Indian savers repose in guaranteed return products has been subjected to hard knocks off late.

Body:

One must provide for a detailed analysis of the issues and challenges posing the India Post despite it taking the path of digitization, online services.

Discuss the positive prospects it can have in future if the challenges are addressed.

Mention the challenges and concerns currently being faced.

Suggest solutions to the same.

Conclusion:

Conclude with way forward.

Introduction:

The Department of Posts (DoP), trading as **India Post**, is a government-operated postal system in India, which is a subsidiary of the Ministry of Communications. Generally called “the post office” in India, it is the most widely distributed postal system in the world. Founded in 1854 by Lord

Dalhousie who laid the foundation for the modern Indian postal service. With **155,015 post offices**, India Post has the most widely distributed postal network in the world. The country has been divided into **23 postal circles**, each circle headed by a Chief Postmaster General.

Body:**Issues with the IndiaPost:**

- **Issue of financial literacy:**
 - it is quite impossible to follow for a majority of households in India which have a subsistence level of income and scant access to financial literacy.
 - A survey on financial literacy among Indian savers by the **Tarun Ramadorai committee** in 2015, found that over 30% of savers did not grasp the concept of compound interest.
- **Lack of Options:**
 - Indian savers have felt a need for 10-year or 20-year fixed return instruments to park their long-term money.
 - Investors who would like a longer-term option have just two choices — the Public Provident Fund (PPF, 15 years) and Kisan Vikas Patra (KVP, 9 years), as the Sukanya Samriddhi Yojana is restricted to those with a girl child.
 - most post office schemes offer tax breaks on the principal invested under Section 80C but their returns are taxed at income tax slab rates (the only exceptions being PPF and Sukanya Samriddhi).
- **Poor customer service:**
 - The foremost reason savers cite in shying away from post office schemes — despite their safety and reasonable returns — is the woefully poor customer service that they need to deal with.
- Most post office schemes offer tax breaks on the principal invested under Section 80C but their returns are taxed at income tax slab rates
- **Lack of Digitization:**
 - India Post continues to rely on archaic modes of working in dealing with customers.
 - Its insistence on a paper application process, old-fashioned passbooks, cheque payments and branch visits ensures a process that is time-consuming and arduous for those seeking to invest their money with it.

Measures needed:

- the crying need for Indian savers to have access to simple fixed return products that offer complete safety of capital without their having to dig into balance sheets.
- There is a need for Small savers to have the predictability of a fixed return for the long term. But given their limited savings, they also need early exit options in case they are beset by an emergency.

- Doing away with bureaucratic rules for investors to get their hands on their own money is critical to make post office schemes more attractive to their target audience
- Re-introducing National Savings Certificates in the 10, 15 and 20-year tenors can meet this need while helping the Central government source long-term funds for capital spending.
- IndiaPost must learn from the private organizations who make deposit investing such a seamless experience for their customers.

Conclusion:

IndiaPost has the potential to convert itself into a digitally enabled, pure deposit-taking bank, it can render a yeoman service both to the government and small savers of this country.

Discuss the concept of monetary transmission mechanism. Explain in what way it can facilitate RBI in ensuring the pass-through of its policy decisions. (250 words)

Economic Times

Why this question:

The question is based on the concept of Monetary transmission and the article provides a detailed analysis of the concept as applied to the Indian economy.

Key demand of the question:

Explain and discuss the concept of monetary transmission in detail, explain its importance to the context of Indian economy.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define what Monetary transmission mechanism is.

Body:

The monetary transmission mechanism is the process by which asset prices and general economic conditions are affected as a result of monetary policy decisions. Such decisions are intended to influence the aggregate demand, interest rates, and amounts of money and credit in order to affect overall economic performance.

The traditional monetary transmission mechanism occurs through interest rate channels, which affect interest rates, costs of borrowing, levels of physical investment, and aggregate demand. Additionally, aggregate demand can be affected through friction in the credit markets, known as the credit view. In short, the monetary transmission mechanism can be defined as the link between monetary policy and aggregate demand.

Monetary transmission is the process through which RBI's policy actions reach its effective end goal of tackling inflation and addressing growth concerns.

Take hints from the article and explain why monetary transmission is important to Indian context.

Conclusion:

Conclude with the benefits of inculcating such mechanism.

Introduction:

The monetary policy refers to a regulatory policy whereby the central bank maintains its control over the supply of money to achieve the general economic goals. Since February 2019, the Reserve Bank of India (RBI) has aggressively cut the repo rate. By cutting the repo rate, the RBI has been sending a signal to the rest of the banking system that the lending rates should come down.

The Monetary Policy Committee of the Reserve Bank of India (RBI) decided to keep the interest rate unchanged at 5.15% in the fifth bimonthly policy review (Dec 2019), citing inflation concerns despite economic growth continuing to slow down.

Body:

Monetary policy scenario in India:

- In India, the process of monetary policy transmission is inefficient.
- For example, between February and December, the RBI cut repo rate from 6.5% to 5.15%.
- But, the interest rate charged by banks on fresh loans fell just 27% of the amount by which the repo rate came down.
- Further, RBI has urged banks to link their lending rates to the repo rate

Reasons for poor monetary policy transmission:

- Repo rates have little impact on a bank's overall cost of funds.
- Reducing lending rates just because the repo rate has been cut is not feasible for banks.
- This is because, for banks to be viable, there must be a clear difference between the lending rate (charged on loans) and the deposit rate (given on deposits).
- The difference between the two has to be not only positive but also big enough for the bank to make profits.
- Notably, to attract deposits, banks pay a high deposit rate.
- Such deposits make up almost 80% of all banks' funds from which they then lend to borrowers.
- On the other hand, banks borrow a minuscule fraction from the RBI under the repo.
- So even sharply reducing the repo rate does not change the overall cost of funds for the banks.
- In effect, unless banks reduce their deposit rates, they will not be able to reduce their lending rates.
- However, if a bank were to reduce its deposit rates, depositors would shift to a rival bank that pays better interest rates.
- Otherwise, they would park more of their savings in small saving instruments (public provident fund, Sukanya Samridhi Yojana, etc.) that pay much higher interest rates.
- Also, 65% of total deposits are "term" deposits (fixed for a certain duration) and take, on an average, up to 2 years to get repriced at fresh rates.
- So, banks cannot always reduce deposit rates immediately as deposits take longer to get repriced.
- Moreover, if banks are under pressure to reduce the interest rate they charge on new loans, they could possibly push up the interest rates on old loans that allow for such flexibility.

Measures needed:

Telegram: <https://t.me/insightsIAStips>

Youtube: <https://www.youtube.com/channel/UCpocbcX9GEIwaile4HLjwA>

Facebook: <https://www.facebook.com/insightsonindia>

- Enabling effective monetary transmission would not only increase the credibility of the Central Bank but also help in strengthening the financial structure.
- Impounding of bank money by RBI is too high with 4% cash reserve ratio carrying no return whatsoever.
- To make transmission work, the least the RBI can do is to reduce CRR.
- Timely transmission of policy rates could be considerably improved if the banking sector's non-performing assets (NPAs) are resolved more quickly and efficiently.
- If the government wants to reduce lending rates, it could focus on bringing down its own fiscal deficit and public sector borrowing.
- At the current low levels of per capita income, the savers are far more risk-averse in India and unwilling to invest in higher-risk instruments other than bank deposits.
- For a repo-linked regime to work, the whole banking system in India would have to shift to that.
- In other words, along with banks' lending rates, their deposit rates too must go up and down with the repo.

The present economic slowdown is a consequence of both cyclical and structural factors. Comment. (250 words)

The Hindu

Why this question:

India is now in the midst of a significant economic slowdown, the International Monetary Fund has said, urging the government to take urgent policy actions to address the current prolonged downturn.

Key demand of the question:

Explain the recent trends being witnessed in the economy and provide for an analysis as to in what way it is the result of both cyclical and structural factors.

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

Briefly discuss what a cyclic slowdown is; A cyclical slowdown is a period of weak economic growth that occurs at regular intervals. A structural slowdown is a more deep-rooted phenomenon signifying weak economic growth for over a long time.

Body:

Discuss first the structural factors responsible for these issues ranging from investment, Failure of the Insolvency and Bankruptcy Code (IBC), Unemployment etc.

Discuss then the cyclical factors – consumption, savings factor etc.

Explain the recent steps taken by the govt. and the RBI.

Suggest way forward.

Conclusion:

Conclude by suggesting solutions and suggestions as to what can be done to address these issues.

Introduction:

According to a research paper by former Chief Economic Adviser Arvind Subramanian, Indian economy is facing both **structural** (that is, more long-term issues related to the overall framework of

the economy such as the flexibility or inflexibility of labour laws etc.) and **cyclical** (that is, more short-term issues such as a bad monsoon that disrupts production of food articles etc.) **challenges**.

Body:

Reasons for economic slowdown:

Cyclical factors:

- Poor policy making like FPI surcharge, angel tax, penalizing for non-compliance of Corporate Social Responsibility (CSR) have deterred investments in the economy thereby affecting the GDP growth.
- Tightening monetary and fiscal policies have left little room for the government to increase its spending to pump-prime the economy.

Shadow banking stress (NBFC crisis):

- NPAs of Banks and Too Much Debt on corporates affecting investment cycle- NPAs have resulted tightening of lending leading to a freeze on investment by industrial houses and corporates. The IL&FS crisis also triggered the Non-Banking Financial Companies' (NBFC) credit crunch in 2018.
- While the unresolved TBS problem provided a progressively weakening ecosystem of banks and companies, the collapse of some of the leading NBFCs has proven to be trigger for the sharp growth deceleration.
- The failure was completely unexpected, prompting markets to wake up and re-assess the entire NBFC sector.
- Much of the NBFC lending had been channeled to one particular sector, real estate. And that sector itself was in a precarious situation.

Weaker global demand:

- India is a net commodity exporter and thus there has been a slump in the volumes of exports due to global slowdown.
- With rising retreat of globalization like Brexit, Trump's protectionist policies and the US-China trade war, global sentiments have remained poor making the prospects of an export led growth bleak.

Structural factors include:

- The slowdown is also part of a longer-term structural shift wherein the Economy is shifting gears from the high investment era to a low investment era as well as a transition from being cash-driven economy to a digitally enabled economy.
- Irregular monsoonal pattern causing droughts in some parts and floods in another has severely affected the agricultural output, transportation facilities leading to imbalance in trade of commodities thereby affecting the economic growth.
- Demonetization and GST has led to a collapse in private consumption as consumers suddenly prefer to hoard cash or keep it in the bank and investments have also been

affected mainly by the small and medium businesses (SMEs) as they are forced to withhold inventories until they are compliant with the new rules and regulations.

- The rates of savings and investment in the Indian economy have declined, as also exports and total credit.
- This has led to a slowdown among the major industries, like the automobiles, diamond, textiles industry, and several Micro, Small and Medium Enterprises (MSME) are experiencing a continuous decline, which has led to the retrenchment of 3.5 lakh workers so far.
- Agriculture is in crisis today on account of rising costs of inputs and low prices of produces, and low public investments in this sector.
- Apart from it, there is income stagnation in urban areas.
- The slowdown in consumption is the major worry for India's economic slump (consumption has been the main driver of India's growth).
- There is a sharp fall in Private Consumption and as well as Public Expenditure.

Measures needed:

- The Reserve Bank of India (RBI) can quickly increase the amount of cash in the economy.
- Then banks, especially public sector banks, can use that together with interest rate policy to provide easy credit. A larger supply of credit should lead to cheaper credit.
- This will have to be supported by reduction of the administered price of credit, which is the RBI's repo rate.
- There could be hurdles to credit off-take due to fiduciary or prudential reasons, so those need to be tackled. Same for mismatched expectations.
- Higher liquidity and disposable income, and increased employment can pull us out of the quagmire.
- reduction and reform of direct individual and corporate taxes, and indirect taxes.
- Labour laws also need to be amended to generate employment.
- The government needs to hold granular conversations with the private sector.
- A skills and industrial policy which can make full use of an abundant pool of reasonably priced labour

Critically examine the double trouble Indian economy is facing – the problem of decreasing economic growth rate and increasing. (250 words)

The Hindu

Why this question:

The article brings out a detailed discussion of the double whammy Indian economy is facing.

Key demand of the question:

Discuss in detail the double trouble Indian economy is facing – the problem of decreasing economic growth rate and increasing

Directive:

Critically examine – When asked to 'Examine', we have to look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question.

While doing so we should explain why these facts and issues are important and their implications. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgment.

Structure of the answer:

Introduction:

Define inflation and the trends of growth witnessing the Indian economy.

Body:

Uneven inflation and sluggish growth present serious dilemmas for policymakers in the country as prices in the economy continue to rise even as economic growth has plummeted to well under 5%. Food inflation, now in double-digits, has caused significant pain. The International Monetary Fund on December 23 called for "urgent" policy measures to reverse the current slowdown that has weighed down global economic growth.

Discuss the causative factors in detail.

Explain what needs to be done to overcome the issue.

Conclusion:

Conclude by suggesting solutions to the problem.

Introduction:

India's GDP growth rate has been decreasing. From the level of 8.1% in the fourth quarter of 2017-18, its quarterly GDP growth has fallen to 5% in the second quarter of 2019-20 (six-year low).

Uneven inflation and sluggish growth present serious dilemmas for policymakers. The prices in the economy continue to rise. Food inflation, now in double-digits, has caused significant pain.

Body:

GDP growth rate has contracted for six quarters

Concerns:

- the non-uniform nature of the current price rise.
- food inflation has crossed the 10% mark for the first time in many years
- Even as food prices have risen rapidly, sectors such as manufacturing have witnessed mild deflation as demand for products drops.
- The central bank's hands have been tied down by the recent spike in inflation, and it has halted its rate cut spree that began in February this year.
- Policymakers, however, tend to view the economy as an entity with a general price level that responds in predictable ways to their policy actions. Such an assumption is likely to cause practical difficulties in implementing policy.

- Indian economy just witnessed a debt-fueled boom followed by a sharp bust in growth rates, it is natural to expect the prices of various goods to adjust in accordance with underlying consumer desires to varying degrees.

Inflation – real or anomaly:

- RBI has termed the recent spike in inflation as a transient phenomenon.
- the rise in food prices may just be an anomaly amid widespread low inflation in the rest of the economy.
- The current food price inflation may be the result of seasonal factors that have affected crop production.
- If so, it should certainly be a transient phenomenon that will not trouble policymakers for anything beyond a few quarters.

Way forward:

- The Reserve Bank of India (RBI) Governor has called for countercyclical measures and structural reforms to help the economy.
- The government should concentrate on the supply-side reforms to both rein in inflation and reverse the economic slowdown.
- Exports can help to stimulate the economy since exports are influenced by the state of the economy in the rest of the world.
- A focused increase in capital expenditures of the Government and the Central public sector undertakings (PSUs) may help to apply the brakes on the slowdown. It might also help to “crowd in” private investment.
- Reform of the Goods and Services Tax (GST) is very much needed.

Deliberate upon the reform measures that can aid India to rise in terms of economic growth to the baseline medium-term potential and help drive growth in a sustainable way. (250 words)

Business Standard

Economic Times

Why this question:

The article is in the backdrop of the recent IMF that has listed reform measures that might help India increase economic growth to the baseline medium-term potential of 7.3 percent.

Key demand of the question:

Explain the necessity of reforms that can help India to increase economic growth to the baseline medium-term potential and help push up growth in a sustainable way.

Directive:

Deliberate – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In general discuss the persistent issues brought out by the IMF.

Body:

Briefly discuss the suggestions made by the IMF.

What are the issues with the economy in the country?

Suggest what reforms can be made to overcome the challenges.

Conclusion:

Conclude by suggesting reforms – both long term and for short term.

Introduction:

India is in the midst of a significant economic slowdown. Declining consumption and investment, and falling tax revenue, have combined with other factors to put the brakes on one of the fastest growing economies in the world. The IMF has listed reform measures that might help India increase economic growth to the baseline medium-term potential of 7.3 per cent.

Body:

Reasons for growing slowdown despite measures:

- Although the government has infused a significant amount of capital into PSBs, there is practically no movement in terms of governance reforms.
- In the absence of such reforms, PSBs would remain prone to the same errors and undermine an efficient allocation of credit, which will affect overall economic growth in the medium term.
- crowding out caused by higher public sector borrowing requirement, which exceeds the net household financial savings of 6.6 per cent of GDP.
- the Reserve Bank of India has started managing yields by buying longer-dated bonds and selling short-tenor bonds, which would also help the government borrow at lower rates. However, measures like these have limitations and could unnecessarily complicate policy management of the central bank.
- the policy space on the fiscal side is virtually non-existent and there are limitations to the extent monetary policy can support growth in the given macro environment

Reform measures:

- the clean-up of bank balance sheets should be completed along with strengthening governance in public sector banks (PSBs) and better oversight of non-banking financial companies (NBFCs).

- the central bank will need to augment regulatory capacity for better oversight of the system, including the NBFC sector.
- fiscal consolidation in the medium term should be anchored to the recommendations of the Fiscal Responsibility and Budget Management Act review committee.
- the use of off-budget financing, which makes the headline deficit number less meaningful. There is an urgent need to improve transparency.
- fiscal stimulus should be avoided at this stage, as evidently, a significantly higher level of government borrowing will push up the cost of money.
- The government would need to be mindful of the risks associated with fiscal slippage at this stage.
- to boost growth, among other things, the government should focus on reforms in product, labour and land markets.
- the government should focus on wider reforms that will help increase growth in the medium term

Conclusion:

India's substantial growth potential depends critically on the implementation of the growth-enhancing structural reforms. Further, there is a strong case for trade liberalization to support growth and employment. The economy clearly needs policy intervention to help push up growth in a sustainable way. There is a need for urgent steps to reverse slowdown while continuing with credible fiscal consolidation and cautioning against fiscal measures to support growth.

A refreshed 'Digital India' programme will play critical role in the pursuit of \$5 trillion economy. Comment.(250 words)

The Hindu

Why this question:

The question is in the context of Finance Minister's announcement on waiver of Merchant Discount Rate (MDR) on digital payments.

Key demand of the question:

The question expects one to comment upon the role of Digital India programme and the essence of it to \$5 trillion economy.

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

Discuss that In the past few years, digital technology has become a vital factor in accelerating the pace of India's economic growth, in promoting social and economic equity by enhancing access for all to information, markets and public services; and in overcoming the country's infrastructure deficit.

Body:

Explain the idea behind digital India.

Discuss the steps taken by the government in this direction.

Discuss the benefits of the programme.

Analyse the challenges and concerns associated.

Conclusion:

Conclude by reasserting its role in augmenting the dream of \$5 trillion economy.

**Introduction:**

According to a recent study by industry association Internet and Mobile Association of India (IAMAI), **Digitization of services will be an essential step towards achieving the \$5 trillion goal.** True to the tenets of the fourth industrial revolution, the next phase of India's prosperity will be driven by digitalization with next-generation technologies. The nation's naturally tech-savvy demography – **1.2 billion mobile phone connections, 560 million internet subscriptions, and over 350 million smartphones** – will serve as the fulcrum of an inclusive digital transformation.

Body:

India's **digital consumer base is the world's second-largest**, as well as the **second-fastest growing among 17 major economies**, as per findings of the latest **India Economic Survey**. And this base is core to the creation of future economic value and societal empowerment as digital solutions backed by new-gen technologies such as artificial intelligence (AI), internet of things (IoT) and automation become ubiquitous.

Digital India:

- The 'Digital India' initiative was launched by Prime Minister Narendra Modi on 1 July 2015.
- It has been launched with an aim of transforming the country into a digitally empowered society and knowledge economy.
- It would ensure that Government services are available to citizens electronically.
- It would also bring in public accountability through mandated delivery of government's services electronically
- Four years on, there have been dramatic improvements in all of its three key facets: in the **creation of pervasive national digital infrastructure**, in the **electronic delivery of public services** and **financial succour to citizens**, and in **enhancing digital awareness and literacy**.

Steps taken by the Government of India in promotion of Digital India:

- **Digilockers:** it is a "digital locker" service operated by the Government of India that enables Indian citizens to store certain official documents on the cloud. The service is aimed towards reducing the need to carry physical documents.
- **BHIM app:** It is an app to enable digital payments. BHIM app was used to facilitate 913 million transactions in 2017-18.
- **JAM Trinity**, a union of Jan Dhan-Aadhaar-Mobile number will better contribute to nation-building and overall economic progress. Digitalization has already helped disburse over \$86.4 billion directly to the bank accounts of beneficiaries spanning over 430 government schemes since 2015 while saving around \$15.3 in the process by plugging channel inefficiencies.
- **Pradhan Mantri Gramin Digital Saksharatha Abhiyan** to make citizen digitally literate. The project is expected to be one of the largest initiatives of the country with an overall target of training 6 crore students until the financial year, 2019. The government has accepted 250,000 Gram Panchayats to register at least 200-300 candidates each.

- **India's digital economy** will touch \$1 trillion by the year 2022. India would be \$10 trillion economy by 2030 and half of it would be the digital economy.
- More than 12,000 rural post office branches have been linked digitally and soon payment banking would also become a reality for them.
- The government also plans to make 'digital village' across the country, by linking all schemes with technology. The 'digital village' would be powered by LED lighting, solar energy, skill development centres and e-services like e-education and e-health.
- Electronic transactions related to e-governance projects in the country have almost doubled in 2015, owing to the Digital India Programme. According to government website electronic transaction aggregation and analysis layer (**eTaal**), 3.53 billion transactions took place in 2014, which almost doubled in 2015 to 6.95 billion.
- The progressive policies and aggressive focus on 'Make in India' have played a significant role in the resurgence of the electronics manufacturing sector.
- Implementation of **Aadhaar** – the biometric digital identity program spanning 1.2 billion citizens, and **the Goods and Services Tax (GST)** – which brought more than 10 million businesses online – have been the hallmarks of large-scale digitalization in India.

Need for a refreshed Digital India:

- One of the most promising outcomes of India's digital transformation experiment is its role in catalyzing the energies and in meeting the blossoming aspirations of India's youth, who have a natural flair for technology.
- Apart from the iconic start-ups that have metamorphosed into unicorns, thousands of technology enterprises and BPOs are sprouting across small-town and rural India.
- With the government's 365,000 Citizen's Service Centres [CSCs] providing employment to a million small entrepreneurs, as well as access to information and services to millions.
- The creation of a nationwide digital infrastructure, allied with potent new tools and technologies that are on the anvil: AI, Big Data, and the Internet of Things [IOT].
- These are expected to galvanize sectors that affect the well-being of every Indian, ranging from agriculture, that can benefit from the infusion of technological intelligence, to natural-resource management, energy-use, transportation, urban-infrastructure and manufacturing.
- Indeed, there is practically no aspect of modern life that cannot be improved by the application of intelligent digitization. India is striving to become one of the early adopters of 5G technology, and its induction is expected to multiply possibilities and opportunities across the spectrum in ways that we cannot fathom now.

Challenges:

- The BharatNet project has been delayed several times which proposes to give internet connection to 2.5 lakh villages.
- Delayed roll-out of Wi-Fi hotspots and the slow speed, in comparison to other developed nation.
- Most small and medium scale industry is struggling to adapt to modern technology.

- Entry level smartphones have limited capabilities for smooth internet access, and the outreach of the 'smartphones' is limited.
- There is an absence of enough skilled manpower in digital technology.
- Lack of user education and there are limited facilities to train personnel. India needs over one million cybersecurity experts to check and monitor the growing menace of digital crime.

Measures needed:

- There is a need for bridging the digital gap in rural areas.
- Websites and portals should be more compliant to standardization.
- Local language portals can be established to cater to the needs of diverse Indian population.
- External audits by NIC and increase of physical infrastructure to increase reach of internet services is necessary.
- Participative regulatory models will not only help us address emerging challenges in India's digital economy, but will also allow us to position ourselves as a technology-friendly jurisdiction.
- There should be an appetite for innovative structures such as regulatory sandboxes and a willingness to enhance regulatory capacity and measure performance

Conclusion:

India in the 21st Century must strive to meet the aspirations of its citizens where government and its services reach the doorsteps of citizens and contribute towards a long-lasting positive impact. The Digital India Programme aims to transform India into a digitally empowered society and knowledge economy by leveraging IT as a growth engine of new India.

What do you mean by shadow banking system? How does the crisis in the shadow banking industry affect the common man? Explain. (250 words)

Reference:

Why this question:

The question is based on the concept of Shadow banking and its effect on the common man.

Key demand of the question:

Discuss in detail the concept of shadow banking; explain the concerns associated and its impact on common man.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Define what shadow banking is – The shadow banking system is a term for the collection of non-bank financial intermediaries that provide services similar to traditional commercial banks but have different regulatory guidelines.

Body:

Briefly explain what is shadow banking system and its role.

Enumerate the challenges faced by it in India.

Suggest ways to address these challenges.

**Conclusion:**

Conclude that the challenges of shadow banking system have to be addressed at multiple levels.

Introduction:

Shadow banks are those institutions that do not collect deposits but still provide loans. These include a variety of institutions, ranging from trusts, investment funds etc. It facilitates the creation of credit but they are not subject to regulatory oversight. As a result, many of the institutions and instruments have been able to employ higher market, credit and liquidity risks, and do not have capital requirements commensurate with those risks. There are concerns that over lending and default in such institutions can destabilize the financial system.

Body:**Importance of Shadow banking:**

- in the context of the developing countries, the shadow banking sector plays an important role in promoting financial inclusion.
- They are very customer friendly, market oriented, innovative and flexible.
- The main advantages of shadow banks lie in their ability to reduce transaction costs, their quick decision making ability, and customer orientation and prompt delivery of services.
- Similarly, in India, the NBFC sector performs an exceptional role in providing credit in the rural areas. Hence, the sector is carefully regulated by the RBI in recent years.

Implications of Shadow banking:

- Shadow lending has played a major role in the build-up to the Great Financial Crisis in 2008.
- In India's case, shadow banking primarily consists of NBFCs and housing finance companies (HFCs).
- A 2017 report by the RBI said that 99.7% of shadow banking in India involves making long-term loans against short-term funding, primarily carried out by NBFCs and housing finance companies.
- Problems arise when such NBFCs become too big, invest in assets of dubious quality and are interconnected with other financial institutions, as demonstrated in the case of IL&FS.
- Additionally, NBFCs, owing to the nature of their business, are also more prone to risks from business cycles, excess leverage and over-reliance on wholesale funding.
- Concentration risks—too much exposure to some sectors—can also be a headache.
- In its recently released Global Financial Stability Report, the International Monetary Fund warned of systemic risks associated with such shadow banking practices which might spill over to banks.
- Such warnings are especially relevant for India as the size of its shadow banking sector appears to be on the higher side, when compared to many other large economies, as per the estimates by Basel, Switzerland-based Financial Stability Board (FSB).

- the recent IL&FS episode, the related lapse on the part of ratings agencies, and the looming threat of a liquidity squeeze across the NBFC sector have raised concerns of spillover, with exposure of banks and mutual funds to NBFCs rising in recent years.

Conclusion:

India also must end the regulatory arbitrage that allows shadow banks to raise most of their funds from retail investors and deposit-taking banks. Either shadow lenders should come out of the dark and be turned into banks, or a firewall will have to be erected around them to protect the rest of banking.

Discuss the need for greater collaboration between the government and the private sector for developing trade-smart schemes that can ensure long-term sustainability for the growth of Indian industry.(250 Words)

Financial Express

Why this question:

The recent WTO panel report highlights the fact that India needs a fresh debate on trade policy framework.

Key demand of the question:

One must analyse the need for greater collaboration between the government and the private sector for developing trade-smart schemes that can ensure long-term sustainability for the growth of Indian industry.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief trace the Recent global events that have had significant implications for reshaping India's trade policy framework.

Body:

First discuss in short the trade policy currently being practiced by the country.

Bring out the policies that the government in power has been trying to aim.

Emphasize on the fact that India's trade policy of the future ought to consider distinct approaches for trade in goods and trade in services.

Present case studies of successful collaborations of the government with private entities in the business scenario.

Conclusion:

Conclude that Greater collaboration between the government and the private sector, for developing trade-smart schemes and incentives that have long-term sustainability and contribution to the growth of Indian industry, is the only sensible way forward.

Introduction:

Recent global events have significant implications for reshaping India's trade policy framework. Supplementing this, the recent WTO panel report also highlighted the fact that India needs a fresh debate on trade policy framework.

Body:

Need for changes in the trade policy framework:

- In 2013-14 when India's per capita GNI (Gross National Income, earlier referred to as GNP or Gross National Product), assessed by the World Bank, breached the threshold of \$1,000.
- This development had a ripple effect in India's status as a 'developing country' under the WTO's Agreement on Subsidies and Countervailing Measures (ASCM), which regulates, among other aspects, export subsidies.
- In 2017, after three consecutive years of India's per capita GNI exceeding \$1,000, India graduated out of the list of 'developing countries' under Annex VII of the ASCM, which basically meant losing the space for foreign trade policy maneuverability that India had enjoyed till then as a developing country.
- A dispute challenging India's export subsidy schemes that was initiated by the US at the WTO in March 2018.
- The initial consultative phase did not lead to any resolution, and therefore the US sought the establishment of a panel for dispute settlement at the WTO in May 2018.
- At the core of the dispute was the contention that 'export incentives' granted by India under the DFIS, EOU, EPCG, MEIS and SEZ schemes are 'export subsidies' that are prohibited under the ASCM.
- The WTO dispute panel recommended that India should withdraw these schemes in a time-bound manner.

Steps undertaken by the Government so far:

- The government has also announced December 31, 2019, as the sunset date for the MEIS (Merchandise Exports from India Scheme).
- There is also anticipation of the launch of a new scheme, the RoDTEP (Remission of Duties or Taxes on Export Products).
- Another significant initiative by the Indian government was the setting up of a group consisting of SEZ stakeholders under the chairmanship of Baba Kalyani, which has made significant recommendations for SEZ reforms that the government is considering.

Measures needed:

- There is a need for emphasis that Indian industry should reduce its reliance on export incentives.
- India has to reinvent itself by increasing its competitiveness in the global market based on increased productivity of resources, improved quality, better efficiency and increasing reliance on data-driven business strategies.
- India's trade policy of the future ought to consider distinct approaches for trade in goods and trade in services
- The distinction between goods and services will also enable designing separate incentives and subsidies for services exports, which neither the WTO nor India's FTAs currently regulate.
- a meaningful trade policy framework needs to be rooted in an evidence-based approach, and rely on microeconomic data from the industry to enable targeted decision-making based on trade data analytics.

- Indian industry will also need to be proactive and establish appropriate mechanisms to capture data at the granular level, through innovative changes in accounting systems, IT systems and MIS, as well as ensure auditable record-keeping of the information required to benefit.
- the trade policy of the future will have to forego its three-decade old preoccupation with export obligations and foreign exchange earnings. The shift from **export growth to broad-based employment and economic growth** was highlighted in the Baba Kalyani report as well.
- Large industry houses, especially, will need to be better equipped with research and appropriate skill-sets, and apportion resources to be able to compliment and supplement government efforts.

Conclusion:

Indian industry should reduce its reliance on export incentives and has to reinvent itself by increasing its competitiveness in the global market based on increased productivity of resources, improved quality, better efficiency and increasing reliance on data-driven business strategies. Greater collaboration between the government and the private sector, for developing trade-smart schemes and incentives that have long-term sustainability and contribution to the growth of Indian industry, is the only sensible way forward.

Inclusive growth and issues arising from it.

“It is important not only to know how to counter the economic stagnation but also how not to counter it”. Deliberate upon the statement in the context of rapidly increasing fiscal deficit of Centre and states in the country. (250 words)

The Hindu

Why this question:

The Centre and the States are so short of resources that their fiscal deficit is burgeoning. The Prime Minister, at a function of the Associated Chambers of Commerce and Industry of India recently, was optimistic but the Reserve Bank of India (RBI) Governor was less positive, admitting that the country's economic problems are also structural. Thus the question.

Key demand of the question:

Discuss the current economic conditions of the country. Explain in detail the causes and concerns of the fiscal deficit of the states and the country. Suggest methods and measures to overcome it.

Directive:

Deliberate – Weigh up to what extent something is true. Persuade the reader of your argument by citing relevant research but also remember to point out any flaws and counter-arguments as well. Conclude by stating clearly how far you agree with the original proposition.

Structure of the answer:

Introduction:

Explain what economic stagnation is.

Body:

Give a brief introduction about the increase of Centre and state's fiscal deficit in the recent times.

Explain the recent steps to contain the situation.

Give the defects in taking such steps.

Suggest requires ways to be taken in this regard.

Give a futuristic way forward for the same.

Conclusion:

Conclude with solutions and way forward.

Introduction:

A **fiscal deficit** occurs when a government's total expenditures exceed the revenue that it generates, excluding money from borrowings. The difference between total revenue and total expenditure of the government is termed as fiscal deficit. It is an indication of the total borrowings needed by the government. Generally fiscal deficit takes place either due to revenue deficit or a major hike in capital expenditure. The Centre and the States are so short of resources that their fiscal deficit is burgeoning. The fiscal deficit at all levels of government is already high so a policy decision is needed on how much more it can be.

Body:

Fiscal Deficit of Centre:

- The government calculated tax revenues on the assumption of a 12% nominal growth. But, it has been around 9%, both last and this year. So, in 2018-19, tax revenue was short by about ₹1.5 lakh crore.
- Given that the base for calculating tax revenue this year was wrong and the rate of growth is incorrect, the revenue shortfall for the Centre will be even larger than last year — around ₹2 lakh crore

Increasing fiscal deficit of states:

- The States get 42% of this revenue so they will get ₹84,000 crore less.
- Further, the concessions in corporate taxation of ₹1.45 lakh crore will also mean ₹58,000 crore less revenue for the States.
- While the Centre has obtained ₹1.76 lakh crore from the RBI's reserves, no such succour is available to the States.
- The Centre will also get the proceeds of disinvestment but that is not shared with the States.
- In brief, the States will have a larger shortfall in resources than the Centre.
- The States have also been complaining that they are not getting the funds that are due to them from the Centre.
- The Centre has partly responded to this by transferring more, but that raises its deficit.
- One of the big contributors to GST has been the auto sector, but with sales falling over the last 10 months collections have declined.
- The Centre is apparently holding back the States' share of IGST and arguing that the cess collection is inadequate to compensate the States for their shortfall.

However, Economic stagnation cannot be countered by the following:

- Income-tax rates cannot be raised now since that would be seen as inequitable — rich corporates will pay a lower tax rate than the middle classes, who pay income-tax.
- There is pressure to reduce income-tax rates to boost demand in the economy.
- But a cut in income-tax rates will largely benefit less than 2% of the citizens who pay a significant amount of income-tax.
- They are well-to-do and unlikely to increase consumption.

- Similarly, the cut in corporate tax rates will not boost demand since neither investment nor consumption will rise.

Challenges posed by Fiscal Deficit:

- It can mean that the Government is spending money on unproductive programmes which do not increase economic productivity. (For example MNREGA, most of the money is eaten midway by the Sarpanch and Local officers.)
- As government borrows from RBI which meets this demand by printing of more currency notes (called deficit financing), it results in circulation of more money. This may cause **inflationary pressure in the economy**.
- When Government keeps borrowing and borrowing to fill up the fiscal deficit pothole, then bond yield will increase. It is not good because more and more of taxpayers' money (i.e. Government's incoming money) will go in repaying that bond interest rate rather than going into education or healthcare.
- State finances become important because of state governments increased reliance on market borrowings.
- The widening of state fiscal deficit now has more direct implications for interest rates in the economy.
- Fiscal deficits may cause macroeconomic instability by inflating the economy as money supply rises.
- Government may be compelled to borrow to finance even interest payment leading to emergence of a **vicious circle and debt trap**.
- Fiscal deficit "Crowds out" investment from private sector as Government borrows most of the cash.
- Borrowing is in fact financial burden on future generation to pay loan and interest amount which retards growth of economy.
- Large deficits even if they do not spill over into macroeconomic instability in the short run will require higher taxes in the long term to cover the heavy burden of internal debt.

Strategies to Reduce Fiscal Deficit:

- There is a need to implement **NK Singh committee recommendations** with respect to Fiscal deficit for a stable economy.
 - Suggested a fiscal deviation band of 0.5%.
 - This means that the government can deviate by 0.5% from the fiscal Deficit target if the economy is in slowdown.
 - The flexibility has been allowed for the government to create space for stimulus to pump-prime the economy.
- On the other hand, when the economy is doing well, the deficit can be compressed by 0.5%.
- A deficit is usually financed through borrowing from either the central bank of the country or raising money from capital markets by issuing different instruments like treasury bills and bonds.
- A drastic reduction in expenditure on major subsidies. Reduction in expenditure on bonus, LTC, leaves encashment, etc. Austerity steps to curtail non-plan expenditure.
- Tax base should be broadened and concessions and reduction in taxes should be curtailed. Tax evasion should be effectively checked. More emphasis on direct taxes to increase revenue. Restructuring and sale of shares in public sector units.

- Famous economist John Maynard Keynes opined that deficits actually assist nations in climbing out of economic recessions.
- However, fiscal conservatives believe that deficits should be avoided by the government which should be inclined towards a balanced budget policy.

Inclusive growth is expected to reduce poverty faster in the sense that it has to have a higher elasticity of poverty reduction. Do you agree? Analyse. (250 words)

Indian economy by Dutta and Sundaram.

Why this question:

The question is based on the Inclusive growth and its relations to Poverty reduction.

Key demand of the question:

Discuss the importance of inclusive growth and its relations with Poverty reduction and in what way it has links with higher elasticity of poverty reduction.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Discuss what inclusive growth is.

Body:

Highlight the features of inclusive growth. The growth is inclusive growth when it is socially inclusive, regionally balanced, which enables every state to do better than in the past, which narrows the gap between different communities, which also brings in our concern for gender equality, upliftment of women, improving their educational condition and social status.

Discuss its relations with higher elasticity of poverty reduction.

Conclusion:

Conclude with detailed analysis and its effects and significance.

Introduction:

The concept of **inclusive growth focuses on equitable growth for all sections of society**. This involves ensuring that fruits of growth and development reach the poor and marginalized sections as well. Inclusiveness is a multi-dimensional concept. Inequalities that include, social exclusion, discrimination, restrictions on migration, constraints on human development, lack of access to finance and insurance, corruption – are sources of inequality and limit the prospect for economic advancement among certain segments of the population, thereby perpetuating poverty.

Body:

Inclusive Growth leads to Poverty Reduction:

- Growth elasticity of poverty (GEP) is the percentage reduction in poverty rates associated with a percentage change in mean (per capita) income.
- Countries with a more equal distribution of income experience a greater reduction in the poverty rate for a given increase in per capita income.
- Economic growth has to be inclusive to ensure the wellbeing of the entire population. Inclusive growth requires full respect for human rights.
- Rapid and sustained poverty reduction requires inclusive growth that permits people to contribute to and benefit from economic growth.
- The main instrument for a sustainable and inclusive growth is assumed to be productive employment.
- Employment growth generates new jobs and income for the individual - from wages in all types of firms, or from self-employment, usually in micro firms - while productivity growth has the potential to lift the wages of those employed and the returns to the self-employed.
- The ability of individuals to be productively employed depends on the opportunities to make full use of available resources as the economy evolves over time.
- Inclusive growth generates decent jobs, gives opportunities for all segments of society, especially the most disadvantaged, and distributes the gains from prosperity more equally.
- Inclusive Growth lessens the fast growth rate of poverty in a country and upsurges the participation of people into the development of the country.

Measures needed:

- Lowering the incidence of poverty and inequality requires a comprehensive strategy.
- Important steps need to be taken like framing policies to improve health, nutrition and education.

- Labour market reforms and reforms of direct taxation will have redistributive effects on the system.
- Schemes like National Rural Employment Guarantee Scheme (NREGS), provide 100 days or more of employment at a wage determined by government are already in progress but there is a need to check the cost effectiveness of these schemes
- Reforms to plug the leakages in the PDS, introduction of GPS tracking, activating vigilance committees, must be undertaken across the country.
- Research needs to be carried out by government agencies to document the 'best practices' in the implementation of government schemes.
- Minorities and other excluded groups, including the poor in upper castes, also need special programmes to bring them into the mainstream.

Conclusion:

To achieve inclusiveness, all these dimensions need to be looked into. Institutional and attitudinal changes should be brought about though this will take time. Awareness about inclusiveness and empowerment is required to be created. Reducing poverty is to be taken as key element in our inclusive growth strategy and there has been some progress in that regard.

Issues related to direct and indirect farm subsidies and minimum support prices; Public Distribution System- objectives, functioning, limitations, revamping; issues of buffer stocks and food security; Technology missions; economics of animal-rearing.

The government, which aims to double farmers' incomes, cannot possibly allow the passage of the seeds bill 2019 that strikes at the very roots of farmer survival. Examine.

The Hindu

Hindustan Times

Why this question:

There is a draft seeds bill awaiting Parliament, which seeks to replace the old Seed Act of 1966. A law regulating seed production and trade is needed to ensure that farmers are protected against spurious seeds, and that seed producers are obliged to put only seeds of good and reliable quality on the market.

Directive word

examine – When asked to 'Examine', we have to look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer

Introduction

One can start off with explaining about the Parliament's plan to introduce the new Seeds bill 2019 and how the previous two versions had created a lot of heated debates.

Body

Highlight the objectives and provisions of the New seeds bill 2019

Discuss the rationale behind the new Seeds bill 2019.

Discuss the challenges posed by the bill.

the Seeds Bill insists on compulsory registration of seeds. However, the PPVFR Act was based on voluntary registration. As a result, many seeds may be registered under the Seeds Bill but may not under the PPVFR Act.

as per the PPVFR Act, all applications for registrations should contain the complete passport data of the parental lines from which the seed variety was derived, including contributions made by farmers. This allows for an easier identification of beneficiaries and simpler benefit-sharing processes. Seeds Bill, on the other hand, demands no such information while registering a new variety.

And so on.

Provide measures to tackle the challenges posed.

Conclusion

Give a fair and balanced conclusion and discuss the way forward.

Introduction:

The **revised draft Seeds Bill 2019**, which the Ministry of Agriculture and Farmers' Welfare placed in the public domain recently for suggestions and comments, seems to be a watered-down version of a draft prepared. The Bill is aimed at **ensuring supply of modern, high quality, cutting edge seed technologies to the farmers** which will help them in enhancing their productivity and profitability. The Bill amends the Seed Act 1966 and Seed Rules 1968. It is evident that the seed industry has been at the center of the significant advances made in agriculture in the last four decades and will continue to do in the years to come.

Body:

Background:

- After the 'Green Revolution', India was quick to introduce the Seed Act 1966 as the first act to govern matters of seed and seed quality.
- It was modelled on the US legislation and aided by a later enactment of the Seed Rules 1968, which were also developed with the collaboration of the US.
- The seed industry in India has been governed by several legislative & policy frameworks such as Seed Act (1966), Seed Rules (1968), Seed (Control) Order (1983), New Policy on Seed Development (1988), Plants, Fruits & Seeds (Regulation of Import into India) Order (1989), Protection of Plant Varieties and Farmers' Right Act (2001), and the Essential Commodities Act, 1955 including Seeds (1955), National Seed Policy (2002), and Seed Bill (2004).
- The Seed Bill (2004) was proposed to replace the Seed Act (1966), however, owing to several shortcomings it was not passed. The 2019 draft version tries to overcome the drawbacks of the 2004 Bill.

Highlights of New seeds bill:

- It is an important legislation to **ensure the supply of modern, high quality, cutting edge seed technologies** to the farmers which will help them in **enhancing their productivity and profitability**.
- All varieties of **seeds for sale have to be registered** and are required to meet certain prescribed minimum standards. For instance, for transgenic varieties of seeds, registration is to be obtained under the Environment (Protection) Act, 1986. This can bring greater accountability to seed companies.
- Exempt farmers from obtaining registration for varieties developed by them. However, if the farmer sells such seeds for a monetary consideration, then that sale needs to be registered. This is to protect the interests of other farmers who buy seeds from such a farmer.

- Farmers are allowed to sow, exchange or sell their farm seeds and planting material without having to conform to the prescribed minimum limits of germination, physical purity and genetic purity (as required by registered seeds). However, farmers cannot sell any seed under a brand name.
- In the proposed Bill, there is a differentiation between the seed producer, seed processor and seed dealer for the purpose of licensing. However, there is no recognition of National Level Integrated Seed Companies with R&D capabilities.
- Currently, a large percentage of seed is sold under a self-certification programme called Truthfully Labelled (TL) seeds. The certification process has been kept voluntary.
- The bill empowers the government to fix prices of selected varieties in case of 'emergent' situations such as seed.
- The bill differentiates the agronomic performance of the seed, its physical quality and the supply of spurious seed, and consequently penalizes the offences and prescribes punishment.

Concerns or challenges posed:

- The Seeds Bill **insists on compulsory registration of seeds**. However, the PPVFR Act was based on voluntary registration. As a result, many seeds may be registered under the Seeds Bill but may not be under the PPVFR Act.
- If a seed variety could have been developed by a breeder, but derived from a traditional variety. In this case, the breeder will get exclusive marketing rights. But no gain will accrue to farmers as benefit-sharing is dealt with in the PPVFR Act, under which the seed is not registered.
- private seed companies can re-register their seeds. They can do this for an infinite number of times after the validity period. Given this "ever-greening" provision, many seed varieties may never enter the open domain for free-use.
- The provision for regulation of seed prices is vague in the bill. Farmers' have also demanded an official body to regulate seed prices and royalties. In its absence, they feel, seed companies may be able to fix seed prices as they deem fit, leading to sharp rises in costs of cultivation.
- According to the bill, the disputes on compensation have to be decided as per the Consumer Protection Act 1986. Consumer courts are hardly ideal and friendly institutions that farmers can approach.
- According to the Seeds Bill, farmers become eligible for compensation if a plant variety fails to give expected results under "given conditions". However, "given conditions" is almost impossible to define in agriculture.

Way forward:

- Quality seeds are India's lifeline. Farming, food and the livelihood of over 60 per cent of the Indian population depend on them.
- A failed harvest has the potential to curtail our GDP and force millions of Indians into poverty and hunger until the next harvest. Overall, India depends on seeds to sustain life.

- The present government has a chance to seed a unique and progressive Seed Bill or plagiarize from others.
- We are sure our government will not let us down in their decision, and ensure their seed bill will give plentiful harvests for Indian farmers and industry.
- Ultimately, the quality seed will be available to the farmers at competitive prices subject to a vibrant growth of the seed industry in an enabling environment.
- Healthy seed industry will lead to enhanced quality seed availability at affordable prices to the farmers.

Effects of liberalization on the economy, changes in industrial policy and their effects on industrial growth.

Embracing the new dogma of globalization without a cost-benefit analysis is equally dangerous, examine in the backdrop of India not joining the Regional Comprehensive Economic Partnership (RCEP). (250 Words).

The Hindu

Why this question:

The question is in the backdrop of India not joining the Regional Comprehensive Economic Partnership (RCEP).

Key demand of the question:

One must examine the relevance of globalisation and the limitations it comes with.

Directive:

Examine – When asked to ‘Examine’, we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

In short explain the concept of globalisation, trace the history of its coming.

Body:

Explain what has been the issue with RCEP and India.

Discuss the pros and cons of globalisation.

Explain the effects of trade with China and its implications on Indian economy.

Highlight that India needs to take a hard look at its choices. Creating global competitiveness and doing all that it takes to do so, including abandoning conventional ways of thinking, cannot be delayed. Better-functioning factor markets and reducing costs for businesses are overdue.

Conclusion:

Conclude that Smarter, creative policies for developing and nurturing the nation’s industrial and technological capacities need to be crafted. Economic nationalism and greater ambition is the need of the hour.

Introduction:

Prime Minister recently announced that India would not sign on to the Regional Comprehensive Economic Partnership (RCEP) agreement. The agreement, which is dubbed as the world’s biggest trade agreement, is expected to proceed with the 15 other members of the agreement, including

Australia, China, Japan, New Zealand, South Korea, and the 10 member states of the Association of Southeast Asian Nations (ASEAN).

Body:

In defending **India's withdrawal from the RCEP**, the government has articulated **three key concerns**:

- The first is the negative impact of joining the agreement in key constituencies in India, particularly farmers and small business owners.
- The second is the lack of concessions within the final agreement on key demands for India such as work visas and liberalisation in services.
- The final is regarding India's trade deficit, and how those deficits would expand under the RCEP, given that India currently runs deficits with 11 of the 15 other member states.
- This concern is particularly acute when it relates to China, with India fearing an influx of cheap Chinese imports into India.
- These concerns, particularly on the fears of Chinese imports and its impact on Indian domestic manufacturers, are legitimate and well-founded.

However, the answer to these concerns is not India's withdrawal from the agreement.

- India's absence in both of **Asia's two key economic architectures (the RCEP and the Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP))** will take away from India's goals as a regional and Indo-Pacific power, as well as a prospective global power.
- Given **India's own ambitions to generate growth and jobs** through spurring manufacturing within India, and becoming a key player and rule-maker on the world stage, India's decision to withdraw from the RCEP is not ideal.
- As academician James Crabtree has noted: "India had already won concessions, including implementation delays stretching into decades and safeguards to protect sensitive sectors like agriculture."
- Moreover, as Arvind Panagariya, former Vice Chairman of NITI Aayog, stated that existing WTO rules "allow us to impose safeguard duties and anti-dumping," which India has used and can continue to use against China when it comes to unfair trade practices.
- Value Chain Integration with Global Markets will yield Sustained Economic Growth.
- Returning to India's articulation of its national interest, this delay in integrating with global value chains will impact India's internal and external ambitions.
- The World Bank found that when coupled with domestic reforms, joining such global value chains can "boost growth, create better jobs, and reduce poverty".
- India's own evidence shows that jobs linked to global value chains earn one-third more than those jobs focused on the domestic market.
- The inability to accede to the RCEP and ensure India's integration into these emerging global value chains means India will lose out on a key opportunity to create such high-quality, high-paying jobs.

Conclusion:

India's decision to withdraw at this stage, particularly in light of India's own articulation of its national interest and its ambitions internally and on the world stage, reflects an inability to translate ambitions into action.

Way Forward:

- The government must focus on the mechanisms through which India can create globally competitive sectors that can demand market access in India's partner countries.
- India will have to accelerate reforms to make exports more competitive.
- Making available round-the-clock good quality electricity, cheap and efficient logistics, and access to cheaper and quality capital.

Science and Technology- developments and their applications and effects in everyday life; Achievements of Indians in science & technology; indigenization of technology and developing new technology.

The Supreme Court has asked government to look into the feasibility of hydrogen-based tech to deal with vehicular air pollution in capital. In light of the above statement, Discuss the hydrogen fuel cells technology and its applications. Also evaluate India's preparedness to adopt it. (250 words)

Indian Express

Why this question:

Supreme Court has asked government to look into the feasibility of hydrogen-based tech to deal with vehicular air pollution in capital. India is looking closely at Japan, which has made progress in this field. The article provides deep insight into hydrogen fuel cell technology which are going to become the preferred mode of transportation in the days and years to come.

Key demand of the question :

The question expects us to explain how hydrogen fuel cells battery work. Thereafter, we need to highlight the pros and cons of technology, its possible applications. Further we need to analyse India's steps to accept and adopt the technology to combat the pollution issues. And finally give a fair and balanced view regarding the future of these technologies.

Directive word

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer

Introduction:

Explain that electric vehicles are the way forward because of threats of climate change

Body:

Explain how hydrogen fuel cell batteries work

At the heart of the fuel cell electric vehicles (FCEV) is a device that uses a source of fuel, such as hydrogen, and an oxidant to create electricity by an electrochemical process. Put simply, the fuel cell combines hydrogen and oxygen to generate an electric current, water being the only by-product. Like conventional batteries under the bonnets of automobiles, hydrogen fuel cells to convert chemical energy into electrical energy. From a long-term viability perspective, FCEVs are billed as vehicles of the future, given that hydrogen is the most abundant resource in the universe.

Discuss the pros and cons of HFC technology

Discuss the various applications of the technology.

Finally, talk about how far is India ready to adopt the FCEV technology.

Conclusion:

Give your opinion on which technology is the future and what should India do.

Introduction:

Fuel cell electric vehicles (FCEV) is a device that uses a source of fuel, such as hydrogen, and an oxidant to create electricity by an electrochemical process. Put simply, the fuel cell combines hydrogen and oxygen to generate an electric current, water being the only by-product. Supreme Court has asked government to look into the feasibility of hydrogen-based tech to deal with vehicular air pollution in capital. India is looking closely at Japan, which has made progress in this field.

Body:

Hydrogen-Fuel Cells:

- Fuel cells are **electrochemical devices** that convert chemical energy in fuels into electrical energy directly.
- A fuel cell produces electricity, water, and heat using fuel and oxygen in the air.
- An electrochemical reaction between hydrogen and oxygen, catalysed by platinum, to produce energy.
- Water is the only emission when hydrogen is the fuel.

Advantages:

- A fuel cell operating on pure hydrogen emits zero emissions at the source.
- Fuel cells provide a much longer operating life than a battery, and since fuel cells have a higher energy density, they are lighter than an equivalent battery system.
- Fuel cells create energy electrochemically, and do not burn fuel, they are fundamentally more efficient than combustion systems.

- They do not require recharging and is a renewable source of energy.
- Hydrogen can be produced from domestic resources, eliminating the need to import foreign oil. It gives energy security.
- Fuel cells are modular, and can be scaled up depending on the power needs of a facility. Larger fuel cells can be linked together to achieve multi-megawatt outputs

Challenges:

- While widely available, hydrogen is expensive. it takes a lot of time to separate the hydrogen element from others.
- The transport and storage of hydrogen is deemed impractical.
- Since it is a very powerful source of fuel, hydrogen can be **highly inflammable**.
- Other non-renewable sources such as coal, oil and natural gas are needed to separate hydrogen from oxygen. As a result, carbon dioxide is also emitted in the air and makes global warming worse.

Global scenario:

- China, far and away the world's biggest auto market with some 28 million vehicles sold annually, is aiming for more than 1 million hydrogen fuel cell vehicles (FCVs) in service by 2030. That compares with just 1,500 or so now, most of which are buses.
- Japan, a market of more than 5 million vehicles annually, wants to have 800,000 FCVs sold by that time from around 3,400 currently.
- South Korea, which has a car market just one third the size of Japan, has set a target of 850,000 vehicles on the road by 2030. But as of end-2018, fewer than 900 have been sold.

Progress in India:

- In India, so far, the definition of EV only covers BEVs; the government has lowered taxes to 12%.
- At 43%, hybrid electric vehicles and hydrogen FCEVs attract the same tax as IC vehicles.
- The Ministry of New and Renewable Energy, under its Research, Development and Demonstration (RD&D) programme, has been supporting various such projects in academic institutions, research and development organisations and industry for development.
- Fourteen RD&D projects on hydrogen and fuel cells are currently under implementation with the support of the Ministry. Between 2016-17 and 2018-19, eight projects were sanctioned and 18 completed.
- The Ministry of Science and Technology has supported two networked centres on hydrogen storage led by IIT Bombay and Nonferrous Materials Technology Development Centre, Hyderabad. These involve 10 institutions, including IITs, and IISc, Bangalore.

Conclusion:

The **FAME India** is a part of the **National Electric Mobility Mission Plan** whose main thrust is to **encourage electric vehicles by providing subsidies**. India must however make a concerted attempt to incentivize both EVs and FCEVs.

India needs to formally come up with its national strategy on synthetic biology — both policy and regulatory. Discuss. (250 words)

The Hindu Business line

Why this question:

India established the Department of Biotechnology during the late 1980s to harness the emerging science to the benefit of the country. However, there has been a long-standing lack of clarity and consensus among scientists, policymakers, industry, farmers and civil society organisations on how India needs to deal with synthetic biological methods like the genetic modification technology in areas like agriculture.

Key demand of the question

The question expects us to explain the concept of Synthetic biology. Thereafter, we need to highlight the pros and cons of technology, its possible applications. Further we need to analyse India's need to come up with a policy to regulate the affairs in synthetic biology. And finally give a fair and balanced view regarding the kind of policy needed.

Directive word

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer

Introduction

Explain the term Synthetic biology and need to come up with a policy on the same in India. Synthetic biology is a field of science that involves redesigning organisms for useful purposes by engineering them to have new abilities. This technology, of developing new life forms, is being pursued by industry despite there being no regulatory framework in place

Body

Explain the concept in detail.

Discuss the various applications of the technology. genetic modification technology in areas like agriculture

Cloning technologies

In less than nine years, synthetic biology has caught the imagination of scientists and the industry's market of \$11 billion in 2016 is expected to grow to \$100 billion by 2025.

Discuss the pros and cons of Synthetic biology.

Finally, talk about need for India to come up with a policy on synthetic biology.

The lack of policy is a cause of serious concern after decades of work in this area compromising research, investments and decision-making.

In the absence of India undertaking a proactive approach to this technology, there is ample chance that we will end up having the same, if not more, contentious debates about synthetic biology organisms and products as those on genetically modified organisms.

Conclusion

Give your opinion on what kind of policy should India come up with respect to synthetic biology.

Introduction:

Synthetic biology is a field of science that involves redesigning organisms for useful purposes by engineering them to have new abilities. Synthetic biology combines chemical synthesis of DNA with growing knowledge of genomics to enable researchers to quickly manufacture catalogued DNA sequences and assemble them into new genomes. Synthetic biology researchers and companies around the world are harnessing the power of nature to solve problems in medicine, manufacturing

and agriculture. This technology, of developing new life forms, is being pursued by industry despite there being no regulatory framework in place.

Body:

Some examples of what scientists are producing with synthetic biology are:

- **Microorganisms harnessed for bioremediation** to clean pollutants from our water, soil and air.
- **Rice modified to produce beta-carotene**, a nutrient usually associated with carrots, that **prevents vitamin A deficiency**. Vitamin A deficiency causes blindness in 250,000 – 500,000 children every year and greatly increases a child's risk of death from infectious diseases.
- **Yeast engineered to produce rose oil** as an eco-friendly and sustainable substitute for real roses that perfumers use to make luxury scents.
- **Biosensors**: an engineered organism that is capable of reporting some ambient phenomenon such as the presence of heavy metals or toxins.
- **Cell transformation**: Cell transformation is used to create biological circuits, which can be manipulated to yield desired outputs. i.e., make antimalarial drug by modifying yeast molecules.
- **Space exploration**: Synthetic biology could help to produce resources for astronauts from a restricted compounds sent from Earth.
- **Access to food**: Synthetic biology was viewed initially by the public as a tool to tackle food scarcity. But concerns exist that large corporations could patent developments, create monopolies and leave developing countries dependent on the West.

Need to come up with national strategy on Synthetic biology:

- India established the Department of Biotechnology in 1986 to harness the emerging science to the benefit of the country. However, there has been **a long-standing lack of clarity and consensus** on how India needs to deal with genetic modification technology in areas like agriculture.
- **Potential of synthetic biology:**
 - It was the Craig Venter Institute, US, that created the first artificial life form and called it 'Synthia' in 2010.
 - In less than nine years, synthetic biology has caught the imagination of scientists and the industry's market of \$11 billion in 2016 is expected to grow to \$100 billion by 2025.
- The scope of technology foresight comprises not only technologies and their applications but also public policies and societal challenges.
- **Involvement of Private sector:**
 - It is surprising to note the number of interventions the private sector is undertaking to focus on product development using synthetic biology in India.

- Currently, there is no consolidated information on who does what, how, for how much, and when the technology will be commercialised with what policy prescriptions.
- Global policy-making favours treating synthetic biology products and organisms on similar lines as living (read genetically) modified organisms.
- There is ample chance that we will end up having the same, if not more, contentious debates about synthetic biology organisms and products as those on genetically modified organisms.
- Projects that propose to synthesize entire genomes **raise important ethical questions** about potential harms and benefits to society.

Way forward:

India's policy and regulatory framework needs to focus on the following:

- defining what constitutes the science of synthetic biology;
- what kinds of research and development priorities will be made for public sector;
- guidance for private sector in synthetic biology research in the future that considers all relevant policy frameworks, including those in intellectual property rights;
- how India will regulate the development and use of this technology, considering issues related to environment and socio-economics.

Awareness in the fields of IT, Space, Computers, robotics, nano-technology, bio-technology and issues relating to intellectual property rights.

Explain how Big data can play a significant role in enhancing our capabilities to manage disasters. (250 Words).

HAL Archives

Why this question:

The question is pertaining to the role of Big data in managing disasters.

Key demand of the question:

The question wants us to write at length about the role big data technologies can play in disaster management. What are the areas of application and hurdles if any involved.

Directive:

***Explain** – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.*

Structure of the answer:

Introduction:

write a few lines about the increased incidences of disasters, their relevance for all the nations etc. Also mention that technologies like Big data, AI etc. can play a huge role in helping us manage the disasters in a better way.

Body:

Define disaster management- e.g. Disaster management is a systematic process with primary aim to reduce the negative consequences and effect of disasters, hence safeguarding people and social infrastructure.

Discuss in points, how big data can play a role in disaster management. E.g Big data generated from geo-informatics and remote sensing platforms can contribute to early warning systems for disasters. Geographical Information Systems (GIS), Global Positioning Systems (GPS) and environmental monitoring sensors with cloud services have a potential to predict disasters; Geoinformatics information along with transportation network data can benefit to understand human mobility patterns during disasters; social data sets; financial data sets etc.

Discuss the challenges involved in the process. E.g. Understanding how to link different datasets with different kinds of disasters, early phase of research and application of big data; protection of personal privacy and information etc.

Conclusion:

Conclude with way forward.

Introduction:

Disaster management is a systematic process with primary aim to reduce the negative consequences and effect of disasters, hence safeguarding people and social infrastructure. Effective management as well as monitoring of disasters is a global challenge.

As the number and access to different datasets is expanding rapidly, the potential and utility of big data is growing for disaster management. Big Data has already saved lives and proven effective within the emergency management field

Body:

Need for Big Data in Disaster Management:

- The storage and processing of large volumes of disaster data are the biggest challenges faced by civil defence, police, fire departments, public health and other government organizations.

- It is very crucial for these organizations to get processed real-time disaster data as quick as possible in order to react and coordinate efficiently.
- Big data tools and techniques can assist disaster management officials to optimize decision-making procedures.
- Effective planning and management hugely depends on the quality as well as quantity of the data available.
- Emergency personnel can minimize their search time and maximize their recovery time when they have access to real-time information

Role of Big Data in Disaster management:

- Empower decision-makers to make accurate assessment during a disaster.
- Big data generated from geo-informatics and remote sensing platforms can contribute to early warning systems for disasters.
- Integration of different data streams, along with data processing and storage is effective for disaster preparedness.
- Help in the development of effective strategies and contribute to minimize the potential effects of disasters.
- Significance of big data analytics to predict occurrences of the floods and for flood management.
- It will help for timely humanitarian response to different disasters.
- Using geospatial datasets along with big data paradigm can provide location based services to avoid hazardous situations.
- It will also benefit in the identification of regions which need the most urgent attention.
- Enhance disaster recovery by utilizing community information and connecting victims with emergency responders and family.
- Connecting Missing People with Their Families
- With big data, safety professionals can better prepare disaster simulations for more accurate implementations.
- Big Data opens up new career opportunities for those who want to find innovative ways to help others.

Limitations:

- Understanding how to link different datasets with different kinds of disasters.
- The potential of big data technology has not been fully explored for disaster management.
- Not all big data is public and freely available.
- Network security threats and vulnerabilities.
- Challenges related to protection of personal information and privacy.

**Way Forward:**

- Integration of datasets along with providing access to information to agencies managing disasters is crucial to enable effective decision making.
- It's important to protect individuals' identifications and efforts should be put to anonymize the collected datasets.
- Leverage techniques from artificial intelligence (AI) and machine learning (ML) to understand, correlate and draw findings from the disaster related data.
- Analysis from processed disasters information can help to identify the most effective strategies to respond future disasters.
- Ensure data consistency, accuracy and completeness for decision making processes.
- Need to investigate data mining challenges as well for disaster management.
- Security as well as privacy issues in data transmission and storage also need to be under constant investigation.

One of the parameters of assessing societal development of a country is the extent to which there has been penetration of information and communications technology (ICT); in this regard explain what do you understand by digital divide? What are its implications? Suggest measures to overcome it. (250 words)

The Hindu

Why this question:

The government on Tuesday announced a new 'mission' aimed at providing broadband access in all villages in the country by 2022, entailing investments of around ₹7 lakh crore from various stakeholders.

Key demand of the question:

One must discuss the concept of digital divide; bring out the issues involved in the Indian scenario and suggest way forward.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:**Introduction:**

Define what digital divide is; A digital divide is an economic and social inequality with regard to access to, use of, or impact of information and communication technologies (ICT).

Body:

Start with the significance of penetration of information and communications technology (ICT). Discuss the impact of it on the society.

Explain that Government of India has been pursuing e-governance initiatives to bring in transparency accountability, speed in delivery of public services. Digital divide has been the major hindrance in path of these e-governance initiatives.

Provide for suggestions.

Conclusion:

Conclude with way forward.

Introduction:

Digital divide refers to the **gap between demographics and regions** that have access to modern information and communications technology, and those that don't or have restricted access. It is an **economic and social inequality** with regard to access to, use of, or impact of information and communication technologies (ICT).

To bridge this gap, the government recently announced **The National Broadband Mission**, which is aimed at providing broadband access in all villages in the country by 2022, entailing investments of around ₹7 lakh crore from various stakeholders.

Body:

Digital divide scenario in India:

- The report, titled Internet in India 2017, was released by the Internet and Mobile Association of India.
- In December 2017, internet penetration in urban India was at 64.84 percent as compared to 60.6 per cent in December 2016. In rural India, however, internet penetration was at 20.26 percent in December 2017, from 18 percent in 2016.
- According to a 2017 global survey by the Pew Research Centre, only one in four Indian adults report using Internet or owning a smartphone.
- despite the booming economy, India's progress in smartphone penetration has been slow.
- in India and Tanzania, less than one-quarter report owning smartphones, the lowest among the countries surveyed.
- A Deloitte India report released in January 2018 revealed that with only 17 percent internet penetration, rural India is lagging behind in connectivity owing to challenges in deployment of fixed broadband networks.

Implications of Digital divide:

- Increasing penetration of digital technology by bridging the existing digital divides is associated with greater social progress of a country.
- **Social capital:** Once an individual is connected, Internet connectivity and ICTs can enhance his or her future social and cultural capital.
- Economic disparity is created between those who can afford the technology and those who don't.
- A direct correlation between a company's access to technological advancements and its overall success in bolstering the economy.
- Countries with less digital gap are benefitted more than the ones with more digital gap.
- **Education:**
 - The digital divide also impacts children's ability to learn and grow in low-income school districts.
 - Without Internet access, students are unable to cultivate necessary tech skills in order to understand today's dynamic economy

- **Lack of information:**
 - Almost all India's socio-economic problems had links to the "digital divide", which had come to stay during the era of digital revolution and then again during the era of internet revolution in India.
 - Rural India suffered from information poverty. Information is controlled by a few at the top of the pyramid who restrict its percolation down to those at the bottom.
- Political empowerment and mobilisation in the age of social media is difficult when there is digital divide.
- **Transparency and accountability are increased** when digitalised for instance people filing taxes online, single window mechanisms for delivery of services ensures good governance as well.

Measures needed:

- To bridge the digital divide, there is a need to **accelerate execution**.
- **Meaningful collaborations with the private sector**, technological innovations and following a consistent focused approach towards the larger objective are necessary.
- Utilisation of multiple modes of transactions such as **Unstructured Supplementary Service Data (USSD), Unified Payment Interface (UPI), Immediate Payment Service (IMPS), and Point-of-Sale (POS) machines**, need to be strengthened
- India also needs easing of regulations to **allow inter-operability of wallets** to ensure easy transfer of funds for merchants as well as for consumers.
-
- A framework comprising both is needed:
 - A **positive obligation** to create infrastructure for a minimum standard and quality of Internet access as well as capacity-building measures which would allow all citizens to be digitally literate.
 - A **negative obligation** to protect citizen's right to privacy.
- The government should invest the resources saved by moving services online, to create Digital infrastructure.
- The definition of digital literacy today must include the ability to access and act upon resources and information found online.
- Internet access and digital literacy are dependent on each other, and creation of digital infrastructure must go hand in hand with the **creation of digital skills**.
- Apart from it, there is a need to **strengthen telecom regulations**, so as to ensure market competition and make the **internet affordable to all**.
- **Zero-rated services for mobile data access**, could be an intermediate step to fully open and affordable Internet access for the poorest, provided that the choice of selecting services is transparent and inclusive.

Extra information:

The National Broadband Mission

- The vision of the national broadband mission is to **fast-track growth of digital communications infrastructure, bridge the digital divide, facilitate digital empowerment and inclusion, and provide affordable and universal access of broadband for all.**
- It will facilitate universal and equitable access to broadband services across the country, especially in rural and remote areas.
- It will also aim at significantly improving quality of services for mobile and internet.
- Under the mission, the government plans to lay incremental 30 lakh route km of Optical Fiber Cable, while also increasing tower density from 0.42 to 1 tower per thousand of population by 2024.
- The mission envisages stakeholder investment of \$100 billion (₹7 lakh crore), including ₹70,000 crore from **Universal Service Obligation Fund (USOF)** in coming years.
- It tries to address policy and regulatory changes required to accelerate the expansion and creation of digital infrastructure and services.
- the Centre will work with States and UTs for having consistent policies pertaining to expansion of digital infrastructure including for **Right of Way (RoW) approvals** required for laying of optical fibre cable.
- **A Broadband Readiness Index** will be developed to measure the availability of digital communications infrastructure within a State/UT

India has achieved remarkable success in unmanned space missions till date; with Gaganyaan it has now ventured into manned space missions Discuss the significance of the Gaganyaan mission to India, what are the major challenges in the manned mission to space? Explain. (250 words)

The Hindu

Why this question:

The Indian Space Research Organization (ISRO) planning its first unmanned test mission of the Gaganyaan mission.

Key demand of the question:

Discuss the significance of the Gaganyaan mission to India and the challenges it has been facing in going ahead with an unmanned mission in space.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Discuss the background of the Mission Gaganyaan; Gaganyaan will be the first manned space mission of ISRO which is proposed to be launched by 2022.

Body:

Deliberate upon the manned and unmanned missions of the past in brief first. Explain what the mission Gaganyaan is.

Gaganyaan is an Indian crewed orbital spacecraft intended to be the basis of the Indian Human Spaceflight Programme.

Gaganyaan is expected to carry three people into space for seven days. The largely autonomous capsule will orbit the Earth in the low earth orbit of 300-400 Km.

The crewed vehicle is planned to be launched on ISRO's GSLV Mk III in December 2021. HAL has manufactured the crew module.

With this, India could potentially become the fourth country to send a man to space, after the erstwhile USSR, the US and China. Denmark also has a manned space flight scheduled for 2022.

Highlight the challenges faced.

Conclusion:

Conclude with way forward.

Introduction:

The Prime Minister of India in his Independence Day address announced that an Indian astronaut would go into space by 2022, when India celebrates her 75th year of Independence. In pursuance of this, Indian Space Research Organization (ISRO) plans to fly the first unmanned test mission ahead of its ambitious crewed Gaganyaan mission by the end of 2020, according to ISRO Chairman.

Body:

Mission Gaganyaan:

- India's first manned space flight Gaganyaan is expected to send three persons into the space for seven days and the spacecraft will be placed in a low earth orbit of 300-400 km.
- Two unmanned Gaganyaan missions will be undertaken prior to sending humans.
- The total programme is expected to be completed before 2022 with first unmanned flight within 30 months.
- The mission is estimated at 9000 crore.
- It would raise scientific and technological temper across the country and inspire youngsters.
- When it achieves the mission, India would be the fourth nation to circle Earth after the Soviets, the Americans and the Chinese.

Challenges:

- For a manned mission, the key distinguishing capabilities that ISRO has had to develop include the ability
 - to bring the spacecraft back to Earth after flight
 - to build a spacecraft in which astronauts can live in Earth-like conditions in space
- India is yet to perfect fool-proof launch vehicle technology, the basic requirement for a manned space mission.
- The Polar Satellite launch vehicle and the Geosynchronous Launch vehicle, the two Indian spacecraft deployed to launch satellites and modules into space, are yet to be man-rated.
- India does not even have the facilities to train astronauts.

- ISRO has not been able to put in place India's own Global Positioning System in spite of completing the NavIC due to dysfunctional atomic clocks in the satellites, rendering the fleet a dud.
- The launchpad at the Sriharikota spaceport, the Satish Dhawan Space Centre, will have to be enhanced for the human mission.
- While the launch vehicle, crew module, re-entry technology, crew escape system are in place, monitoring and tracking systems, Environmental Control & Life Support System (ELCSS), space suit and crew support systems are still in the developmental phase.

Way forward:

- It is important to ensure engagements at political level to obtain long term commitment for India's human space flight missions
- Financial implications of a long-term human space-flight programme development should be assessed and the returns and benefits should be clearly articulated
- It is important to overcome the technological challenges to ensure a safe, successful manned space mission. International collaboration in this domain can help India ensure a robust technology for its HSF programme.
- Selection of Indians for astronauts will be an important step. Procedures and specifications for astronauts and a rigorous selection process is suggested.

Conservation, environmental pollution and degradation, environmental impact assessment

The idea that 'green technology' can help save the environment is dangerous because it glosses over the alternatives' ills. Analyse.

The Wire

Why this question:

The world is grappling with the consequences of climate change and environmental degradation. A number of solutions have been posed and several of them are current being implemented. However it has been seen that many of those solutions while addressing one aspect create further problems for environment and our climate. It is therefore important to discuss those solutions and their effects.

Directive word:

Analyze-here we have to examine methodically the structure or nature of the topic by separating it into component parts, and present them as a whole in a summary.

Key demand of the question:

The question wants us to dig deep into the solutions being posed and implemented to address the issue of climate change and environmental degradation and how they in turn affect the environment in a negative way.

Structure of the answer

Introduction:

write a few introductory lines highlighting environmental degradation, biodiversity loss and climate change. E.g Industrialists around the world have been extracting a wide array of minerals and metals to build electric vehicles and 'cleaner' batteries, simply replacing one injustice with another. present some related statistics and mention that a number of solutions have been currently in vogue to address those issues.

Body:

In a bid to reduce the extraction of hydrocarbons for fuel as well as to manufacture components for more efficient electronic and mechanical systems, industrialists around the world have been extracting a wide array of minerals and metals, destroying entire ecosystems and displacing hundreds of thousands of people. It's as if one injustice has replaced another.

Discuss how the extraction of minerals for development of Green technology has been leading to environmental pollution, taking the cases of Guinea, Congo etc.

Discuss Biofuels as alternatives to fossil fuels and challenges posed by them.

Wind farms vs biodiversity loss and air pollution.

Challenges posed by recycling.

Conclusion:

Based on your discussion, form a fair and a balanced conclusion on the given issue

Introduction:

The climate change and environmental degradation has posed some grave threats to the environment. According to **UN Water**, some 1.1 billion people worldwide lack access to water, and a total of 2.7 billion find water scarce for at least one month of the year. The recent **IPCC's "Special Report on Global Warming of 1.5°C"** revealed that the impacts and costs of 1.5 degrees Celsius of global warming will be far greater than expected. The Intergovernmental Panel on Climate Change says a **1.5°C average rise may put 20-30% of species at risk of extinction**. If the **planet warms by more than 2°C, most ecosystems will struggle**. Coral reefs are projected to **decline by a further 70-90% at 1.5°C**.

Body:

In a bid to reduce the extraction of hydrocarbons for fuel as well as to manufacture components for more efficient electronic and mechanical systems, industrialists around the world have been extracting a wide array of minerals and metals, destroying entire ecosystems and displacing hundreds of thousands of people. It's as if one injustice has replaced another.

The salt flats 3,600 meters above sea-level in Bolivia and Chile hold nearly half of all the lithium in the world. Lithium is another important metal required to manufacture energy storage devices. (This year's Nobel Prize for chemistry was awarded to researchers who invented the lithium-ion battery.) But the rush to control Bolivia's resources quickly destabilised the local socialist government, which had intended to regulate mining and distribute profits among the population. The right-wing government in place now is likely to reopen negotiations with foreign mining companies that its predecessor had nixed.

- **Desalination technology:** Desalination has become a solution for many cities located in coastal areas. The saline water from the sea is treated and the water is made potable. More than 16,000 desalination plants are scattered across the globe producing fresh water, according to a **first global assessment of the sector's industrial waste**.
- **Challenges posed:** The plants produce more briny toxic sludge than fresh water. For every litre of fresh water extracted, a litre-and-a-half of salty, chemical-laden sludge called brine is dumped—in most cases—into the ocean. That's enough to cover the state of Florida in a 30-centimetre (one-foot) layer of slime.
- **Hydro Fluoro Carbons to protect ozone depletion:** The **1987 Montreal Protocol** banned industrial chemicals (CFCs) dissolving stratospheric ozone, which protects us from the Sun's

dangerous ultraviolet rays. To replace the forbidden molecules, used in aerosols and refrigerants, scientists invented a new category known as HFCs.

- **Challenges posed:** But there was a small problem that didn't emerge until much later: the substitutes—while harmless to the ozone layer—were **dangerous greenhouse gases**, thousands of times more potent than carbon dioxide or methane. That meant a new, protracted round of negotiations over an amendment calling for the phase of HFCs, which was finally adopted in 2016.
- **Bio-fuels:** The rise in oil prices in the 1970s, and later the looming threat of climate change, boosted the production of bio-fuels made from corn, sugarcane and palm oil. It seemed like a great idea: planet-warming CO₂ released into the atmosphere when the bio-fuels were burned would be partially offset by the CO₂ absorbed while the plants were growing.
- **Challenges posed:** The energy needed to transform and transport plant-based fuels undercuts their original purpose. To make matters worse, the newly emerging market created a perverse incentive to cut down tropical forests—far more efficient at soaking up CO₂—to make way for sugarcane and palm oil trees. When it comes to climate change, projections for how humanity can cap global warming under two degrees Celsius (3.6 degrees Fahrenheit) assume a major role for bio-fuels. But recently scientists have calculated that an area up to twice the size of India would be needed to cultivate them, which may not leave enough land to grow food.
- **Wind farms:** There are some 350,000 wind turbines scattered across the globe producing more than 500 gigawatts of clean, green energy and supplying four percent of global electricity demand.
- **Challenges posed:** According to one estimate, one wind turbine requires 900 tonnes of steel, 2,500 tonnes of concrete and 45 tonnes of plastic. For every tonne of steel produced, 780 kg of coal is used during the extraction phase. The production of every tonne of concrete emits 1.25 tonnes of carbon dioxide. But wind farms are also bird killers: up to 328,000 birds—especially those that fly at night—are felled every year by fast-spinning blades in the United States alone, where there are some 50,000 turbines. They also **disrupt ecosystems**.
- **Case Study:** A scientific study of **wind farms in the Western Ghats**, a UNESCO-listed range of mountains and forest spanning India's west coast, found that predatory raptor birds were four times rarer than in adjacent areas. Their absence cascaded down the food chain and radically altered the density and behaviour of the birds' prey. There was, in particular, an explosion in the raptors' favourite meal: fan-throated lizards.
- **Solar energy:** Photovoltaic solar panels absorb sunlight to generate electricity. This has powered many homes in developing and under-developed countries. It has shown the potential to reduce the consumption of coal for electricity generation.
- **Challenges posed:** conventional methods of solar panel manufacturing release nitrogen trifluoride, a greenhouse gas 17,200-times more potent than carbon dioxide and with an atmospheric tenancy of over seven centuries. High-voltage power generation and transmission requires the use of sulphur hexafluoride, which is 23,500-times more potent than carbon dioxide and lingers in the atmosphere for a millennium.
- **Recycling** is also energy-intensive and can often salvage only a fraction of spent resources. For example, the world produces about 360 million tonnes of plastic a year but only about

9% of all plastic waste is recycled. If production continues to grow at its current rate, recycling a tenth of it will soon be rendered meaningless.

Conclusion:

The need of the hour is to create solutions that are sustainable. The solutions themselves shouldn't pose further challenges, easily scalable and cost saving. Better Research and Development techniques with right validation is the way ahead before deployment on large scale

Case Studies:

- *The Republic of Guinea in equatorial Africa hosts 30% of the world's bauxite reserves as well as large quantities of iron ore. Some 98% of the country is also covered by forests. Aluminium from bauxite is required to make electric cars and high-capacity electric cables. Steel is the most commonly used metal and is used to make windmills and for structural use in urban infrastructure. Imagine the plight of Guinea's forests in the face of rising demand for both these materials.*
- *The Congo, its neighbour, is home to 60% of the world's cobalt. This metal is a critical component of batteries that power smartphones and electric vehicles. Contractors are thought to employ some 35,000 children, forced to work in pitiable conditions, to extract this metal. The mines erected to service this industry have destroyed large tracts of savannah and agriculture land and eliminated the livelihoods of thousands. As the demand for cobalt increases, as it is bound to, the Congo's rainforests are likely to be the next big casualty.*

It is evident that our challenges related to the environment are interwoven with challenges from societal, technological and philosophical perspectives. Analyse.

Livemint

Why this question:

Mankind's progress has had unintended consequences on the environment. These include climate change, extreme weather events and the reduced availability of potable water.

Key demand of the question:

One has to find the reasons for reduced availability of potable water due to human actions, climate change and extreme weather events.

Directive:

Analyse – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Start off with how Unintended consequences of human progress over the past decades have begun to adversely impact the environment we live in, which provides the basic conditions for life on earth to exist.

Body:

Present the various environmental challenges that is posed to us today like lack of potable water etc. Discuss how we can get an understanding to our current environmental challenges can only come from studying them in the context of technology, society and philosophy. Provide solutions to tackle the same.

Conclusion:

Conclude with a way forward.

Introduction:

During last decade, environmental issues have been receiving increasing attention in all spheres of life, including greater coverage in the media. There is also a growing awareness of the need and importance of involving people actively in the protection of environment and management of the natural resources of their locality. Unintended consequences of human progress over the past decades have begun to adversely impact the environment we live in, which provides the basic conditions for life on earth to exist.

Body:**Environmental challenges faced today:**

- The layer of ozone in the upper atmosphere, which protects us from harmful radiation, is being depleted due to our excessive use of aerosol chemicals.
- Predictions made back in the 1980s about climate change are starting to come true. Extreme weather events around the world appear to be more common than before.
- Cities like Chennai and Mumbai get flooded during the monsoon, and yet run out of water later in the year.
- One of the most critical crises that we face today is access to potable water.
- There are three kinds of access problems. The first one is where there are no systems in place for the regular supply of water; for example, in urban slums.
- The second is where there is a regular system in place, but a section of society faces challenges due to the seasonal unavailability of water. This situation is becoming common in cities like Chennai, Bengaluru, Mumbai, and is giving rise to widespread distress.
- The third kind of situation has often been observed in rural areas where people depend on natural sources of drinking water that are fast becoming inaccessible because of pollution and environmental changes.

Environmental challenges are interwoven:

- An understanding of our current environmental challenges can only come from studying them in the context of both technology and society.
- Technology is one of the key attributes of today's human society, one that makes our era entirely different from thousands of years of human presence on earth.
- On one hand, our tech-centred orientation is one of the primary causes of our alienation from nature; on the other, technology can help us cope with the environmental stresses being faced by human society.
- From a different point of view, technology is one of the major factors inducing environmental pollution.
- To accommodate technological progress, humans have always sacrificed the environment, which eventually led to complex issues like climate change and wide-scale biodiversity loss.

Global environmental crisis and its relationship with technology:

- First, how technology can help society manage environmental issues.

- Second, how society can act to manage the externalities of technology within environmentally acceptable standards.
- And third, how technology can aid in evaluating the current environmental condition and its impact on society.

Environmental issues in the context of society:

- we recognize that environmental migration is one of the key issues that future generations will need to cope with.
- The United Nations forecasts that there could be up to 1 billion environmental migrants by 2050, mostly from coastal areas.
- We must think through current land-use changes, diversification of livelihoods at a community level, building resilience, and policies for environmental migrants.
- An added layer of complexity, given our political boundaries, is how humanity should respond to environmental migrants.

Measures needed:

- We must redefine the needs of an individual, and understand the reasons behind increasingly consumeristic lifestyles across the globe. Humans do not harm the environment intentionally.
- Environmental disturbance is a by-product or negative externality of human actions that arise due to our needs and aspirations—in other words, the unintended consequences of human progress.
- Exploring the nature of our progress and the consumption landscape could be one way to address the latter.
- The cycle of production and consumption does not happen in a void. It is a way to respond to individual needs and desires.

Conclusion:

The strategies to ensure sustainable development has at least four important elements, such as ecologically harmonious, efficient and conserve resources including energy, and must aim at local self-reliance and offer equity with social justice. While for the achievements of the first three elements, considerable inputs from the science, technology, economics, and sociology would be needed while equity is a political question calling for the sensitivity and commitments of the political masters and policy makers in letter and spirit.

While the present climate activism movement has certainly helped the cause in terms of raising awareness, it spells out little in terms of meaningful action. Comment with suitable justifications. (250 words).

[Hindustantimes](#)

Why this question:

The article brings out the concerns associated with climate activism and argues over the success of the same.

Key demand of the question:

One must

Discuss the instance of climate activism, explain the challenges involved therein.

Directive:

Comment– here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

In brief narrate what you understand by climate activism.

Body:

Explain the concerns involved as to what are the issues, why the movement of climate activism isn't achieving its true agenda.

What are the flaws? – Failure to recognise the need for a sustainable outcome.

Explain with suitable examples, take hints from the article.

Discuss what needs to be done to ensure the movement achieves true outcomes.

Conclusion:

Conclude with need to foresee and that fighting climate change is a mammoth task and we need all hands-on deck if we are to have a real shot.

Introduction:

Climate change is the greatest threat faced by the world in history, according to a 26-country survey released by the Pew Research Center. The United Nations has called climate change as the “defining issue of our time”.

Body:

More words than actions towards climate activism:

- Awareness and support for climate action has risen rapidly in the recent years, especially amongst the youth.
- 2019 has been a momentous year for climate activism with millions of people protesting for climate action all over the world.
- On September 20, over four million protesters gathered in more than 150 countries making it the largest climate strikes in world history.⁷
- Crowds full of children, youth and even older people have come out and participated in these strikes happening throughout the year.
- Thus, the present climate activism movement has certainly helped the cause in terms of raising awareness.

However, the issue with present climate activism lies in the fact that it spells out little in terms of meaningful action. This is because

- Millions of people striking for a cause without defining what outcomes they expect.
- Asking the governments to declare a state of climate emergency seems a little meaningless, because there are no set actions a government needs to take to accompany that declaration.
- People continue with business as usual, while publicly being in a state of climate emergency accompanied by a loosely defined “action plan”.
- Another issue with the movement in its present form is that it doesn't hold companies or developed countries proportionately accountable.

- **Lack of common but differentiated responsibility:**
 - There is no clarity on responsibilities of the companies and developed nations who are historically responsible for greenhouse emissions
 - developing nations expected by the youth of the world to share equal burden of a problem which has been primarily created by some developed nations

Way forward:

- The climate movement in each city, state or country needs to define what steps they would like to see their governments and the private sector take in different areas such as transport, energy, waste management, urban development and ecosystem management, and protest specifically in demand of their fulfilment.
- There should also be a way for citizens to pledge individual actions, however small, in support of the movement.
- This would highlight the commitment of the supporters and ensure that climate consciousness becomes a part of people's everyday lives instead of being just a once a week 'event'.

"The oxygen bars are the new entrants in the field to tackle pollution in major cities in India". Elucidate. (250 Words)

The Hindu

Why this question:

The article is based on the concept of oxygen bars that are being seen as a new solution to the problems of pollution in the big cities of the country.

Key demand of the question:

One must discuss in detail the relevance of such new idea in controlling the menace of pollution.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In brief narrate that the popularity of packaged air began around four years ago when a Canadian company launched 'canned air' for people in China when air pollution in many cities became alarmingly high.

Body:

Explain that the newer addition — oxygen-bar — a recreational parlour or cafe which serves 'pure oxygen' is becoming a more attractive destination, particularly in cities with dangerous levels of air pollution. At times, the oxygen comes in different scented flavours.

Discuss first the issue of pollution facing the major cities in the country.

Explain what needs to be done.

Conclusion:

Conclude that It definitely calls for serious vigilance by the clinicians and policy makers to ensure the safety issues associated with recreational oxygen use, particularly flavoured oxygen in such bars, parlours and spas.

Introduction:

The popularity of packaged air began around four years ago when a Canadian company launched 'canned air' for people in China when air pollution in many cities became alarmingly high. The newer addition — oxygen-bar — a recreational parlour or cafe which serves 'pure oxygen' is becoming a more attractive destination, particularly in cities with dangerous levels of air pollution. At times, the oxygen comes in different scented flavours.

Body:

An oxygen bar is an establishment, or part of one, that sells oxygen for recreational use. Individual flavored scents may be added to enhance the experience. The flavors in an oxygen bar come from bubbling oxygen through bottles containing aromatic solutions before it reaches the nostrils: most bars use food-grade particles to produce the scent, but some bars use aroma oils.

Issue of pollution facing the major cities in the country

- It is clear that the problem of air pollution has increased very seriously and over the years its intensity and seriousness has grown. In many places there is no proper air quality measurement mechanism. The main constituent of the pollutants is the particulate matter which breaches the standard prescribed by Central Pollution Control Board (CPCB)
- CPCB standards are fairly above the international WHO standards. The standards are breached for longer periods of time.
- The thrust towards renewable energy is time consuming and expensive. Construction and demolition are the two major sources of Particulate Matter in the atmosphere. Most of the vegetation has been denuded, there is deforestation taking place and soil erosion acts a source for Particulate Matter pollution.
- The bad air quality tells you that the governance is not upto mark.
- It is a huge problem and increasing geographically every year.

Benefits of Oxygen bars:

Most claims around the benefits of oxygen bars haven't been scientifically proven. Proponents of oxygen bars claim purified oxygen can help:

- increase energy levels
- improve mood
- improve concentration
- improve sports performance
- reduce stress
- provide relief for headache and migraine
- promote better sleep

Are oxygen bars safe?

- The benefits of oxygen bars haven't really been studied and neither have the risks.

- A healthy person's normal blood oxygen is between 96 and 99 percent saturated with oxygen when breathing normal air, which makes some experts question what value extra oxygen could have.
- Some medical conditions benefit from supplemental oxygen, but even for these people, getting too much can be harmful and even deadly, according to research.
- Administering oxygen to people admitted to the hospital with acute illnesses is a long-held standard practice. However, a study published in 2018 in The Lancet Trusted Source found evidence that oxygen therapy may increase the risk of death when given liberally to people with acute illness and trauma.
- The scents used are delivered by bubbling the oxygen through liquid containing either an oil-free, food-grade additive or an aroma oil such as an essential oil. Inhaling oily substances can potentially lead to a serious inflammation of the lungs, known as lipoid pneumonia.
- The scents used in scented oxygen can also be harmful to some people, especially those with lung diseases. According to the Lung Association, the chemicals in scents and even those made from natural plant extracts can cause allergic reactions that can range from mild to severe.
- Unlike conventional oxygen therapies used in respiratory conditions that is administered for a short or long period in hospital or at home, people take oxygen for an ultra-short period in these bars (30 minutes or less).
- As per the standard clinical procedure, oxygen supplementation can be administered only in case of hypoxemia (lowering of oxygen saturation in the arterial blood below 95%) and it does not have any consistent beneficial effect on non-hypoxemic patients.

Conclusion:

It is unfortunate that no medical community has come forward to spread awareness among people for this increasingly captivating yet unscientific business with no known or established clinical benefit. It definitely calls for serious vigilance by the clinicians and policy makers to ensure the safety issues associated with recreational oxygen use, particularly flavoured oxygen in such bars, parlours and spas.

Evaluate the factors leading to the high levels of pollution in Indian rivers. What can be done to protect and prevent our rivers from degradation and slow death? Discuss. (250 words).

The Hindu

Why this question:

A study conducted by Central Water Commission (CWC) from May 2014 to April 2018 revealed that India's major river systems are contaminated with heavy metals.

Key demand of the question:

One must evaluate the factors leading to the high levels of pollution in Indian rivers and discuss what can be done to protect and prevent our rivers from degradation and slow death.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

**Introduction:**

State the findings of the report; quote the facts and relevant case study.

Body:

First discuss the main sources of river pollution – agriculture, mining, milling, plating and surface finishing industries that discharge a variety of toxic metals.

Discuss then their impact.

Quote the discussion provided by the report of CWC.

Take hints from the article and cover relevant aspects.

Conclusion:

Conclude with urgency to address the issue of River pollution in the country.

Introduction:

Rivers are increasingly being treated as lifelines to an ever-growing population, the realisation of which is still to sink in as far as India is concerned. More than half the rivers in India are polluted, with the developing economic power unlikely to meet demand for fresh water from its still-growing population. Samples taken from two-thirds of the water quality stations spanning India's major rivers showed contamination by one or more heavy metals, exceeding safe limits set by the Bureau of Indian Standards.

Body:

Findings from the third edition of an exercise conducted by the Central Water Commission (CWC) from May 2014 to April 2018:

- The study spanned 67 rivers in 20 river basins.
- Samples from only one-third of water quality stations were safe.
- The rest, or 287 (65%) of the 442 sampled, were polluted by heavy metals.
- Samples from 101 stations had contamination by two metals, six stations saw contamination by three metals.
- Iron emerged as the most common contaminant with 156 of the sampled sites registering levels of the metal above safe limits.
- None of the sites registered arsenic levels above the safe limit.
- The other major contaminants found in the samples were lead, nickel, chromium, cadmium and copper.
- Lead, cadmium, nickel, chromium and copper contamination were more common in non-monsoon periods while iron, lead, chromium and copper exceeded 'tolerance limits' in monsoon periods most of the time.
- Arsenic and zinc are the two toxic metals whose concentration was always obtained within the limits throughout the study period.

Factors behind high pollution of rivers:

- Chemicals & Effluents**
 - The main sources of heavy metal pollution are **mining, milling, plating and surface finishing industries** that discharge a variety of toxic metals into the environment.
 - Industrialisation along the river belt is polluting the water with chemicals and other industrial effluents.
 - While large corporations adopt advanced techniques to treat effluents and chemicals to negate or reduce their toxicity, smaller firms often have no such considerations and violate environment safety standards.
- Failure of regulatory agencies and implementation of laws:**
 - According to the recent finding of the Central Pollution Control Board that the number of critically polluted segments of India's rivers has risen to 351 from 302 two years ago is a strong indictment of the departments responsible for environmental protection.
 - The data show that the **plethora of laws** enacted to regulate waste management and protect water quality are **simply not working**.
 - The study by CPCB also underscores the **failure of many national programmes** run by the Centre for river conservation, preservation of wetlands, and water quality monitoring.
 - Low priority is accorded to the enforcement of laws by SPCBs and pollution control committees.**
- Garbage Dumping**
 - High population density around the river banks and the reckless dumping of non-biodegradable waste, especially plastics, is further adding to water pollution.
 - Despite warning and strict fines imposed by local administrations on those found dumping garbage into rivers and their estuaries, this uncivilised practice continues unabated.

- The other reasons for contamination are **population growth and rise in agricultural and industrial activities.**
- **Washing & Sewage**
 - Laundering clothes on river banks is a common sight in India. Modern detergents are made of chemicals that contaminate river waters.
 - Defecating around river banks is yet another horrible practice in rural parts of the country that contributes to rising pollution of rivers in India.
 - The situation is worsened by local administrations and private operators of sewage collection tankers dumping the waste in rivers and their estuaries.
- **Cremation & Last Rites**
 - Devout Hindus attach a lot of significance to life after death. Hence, cremation grounds in rural India are located on the banks of rivers.
 - Varanasi, also known as Kashi, is one such place with cremation grounds located right on banks of river Ganga which is also one of the longest rivers in India.
 - Unfortunately, lots of Indians families that cannot afford cremation consign mortal remains of loved ones to rivers. These human cadavers cause severe water pollution.
- **Sand Dredging**
 - High-quality sand from river beds is needed for India's booming construction industry. This has led to rising pollution in Indian rivers.
 - Dredging operators- usually the unlicensed ones- deploy kerosene and diesel-fueled cheap watercraft manned by cheap labour for sand dredging. Engines of these boats cause pollution.

Measures needed to protect and prevent our rivers from degradation and slow death:

- **CPCB** should be reporting more frequently on pollution, and carrying out intensive measures through State Pollution Control Boards to eliminate pollutants, starting with sewage and industrial effluents.
- Low priority accorded to enforcement of laws by the SPCBs and Pollution Control Committees. So the immediate plan should be to expand the supply of treatment plants. Sustained civil society pressure on governments is vital to ensure that this is done in a time-bound manner.
- On the industrial side, the plan to bring all liquid effluent discharge from textile units and tanneries to zero has to be pursued vigorously, giving industries the assistance to help them choose the best technologies for the recovery of waste water for reuse.
- These measures are urgently needed to revive India's many dying rivers, protect its agriculture, and prevent serious harm to public health from contaminated water.

- All state governments must make it mandatory to have rain water harvesting techniques in government as well as private buildings and make roof water and surface harvesting mandatory.
- **Include embankments, embankment roads, and roads on either side of the river** need to be developed as greenways, with walkways, cycle paths and recreational centres to facilitate the link between citizens and the river.
- **Rejuvenation of wetlands:** These wetlands can store millions of gallons of flood water and recharge ground water and also enhance the river flow during lean period
- **Reforestation and protection of forested catchments:** Forested catchments reduce soil erosion and siltation of the river, they regulate stream flows and micro climate. A protected catchment automatically means lesser silt in rivers
- **Vegetated and protected riparian banks:** These protect the river banks, reduce erosion and maintain water quality.

Way forward:

- The immediate plan should be to **expand the supply of treatment plants**.
- **Civil societies** pressure on the Government is the vital aspect.
- All liquid effluent discharge from the textile units and tanneries should be brought down to zero and it is to be pursued rigorously. Assistance to be given to industries to choose the best technologies for recovery of waste waters for reuse.
- By adopting a zero-waste lifestyle that consists of “**Rethink, Reduce, Reuse, Recycle, Compost and Close the Loop (4R2C)**”, we can limit our trash output and save tonnes of solid waste from ending up in landfills and rivers.
- The adoption of a river can also be done as a part of corporate sustainability responsibility programmes organised together with the local communities with the support of local government agencies.
- These measures are urgently needed to revive India’s many dying rivers, protect its agriculture, and prevent serious harm to public health from contaminated water.

“Agriculture will play a crucial role in addressing the planet’s future challenge and is a key to providing important adaptation, mitigation synergies to climate change as well as socio-economic and environmental co-benefits.” In the context of the statement discuss the concept of Climate Smart Farming Systems and its relevance. (250 Words).

PIB Government of India

The question is based on the concept of Climate Smart Farming Systems.

Key demand of the question:

One must explain what is Climate Smart Farming Systems and relevance of agriculture and its contribution in mitigating the effects of climate change.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

**Introduction:**

Start by stating that International Seminar on Climate Smart Farming Systems' for BIMSTEC countries is being held in Delhi.

Body:

Define – Climate-Smart Agriculture (CSA) is an approach to help farmers respond effectively to climate change and ensure food security.

State the objectives of it –

Sustainably increasing agricultural productivity and incomes;

Adapting and building resilience to climate change; and

greenhouse gas emissions mitigation

discuss the important aspects of it – methods, impact and utility,

Conclusion: Conclude by highlighting the significance of it.

Introduction:

Agricultural production systems are facing increasing competition from other sectors for limited natural resources. The availability of these resources and their quality are also being affected by unsustainable management practices and changing climatic and weather conditions. To respond to this situation, the agriculture sectors must improve their sustainability performance and adapt to the impacts of climate change in ways that do not compromise global efforts to ensure food security for all. **FAO defines Climate-smart agriculture (CSA)** as “agriculture that sustainably increases productivity, enhances resilience (adaptation), reduces/removes GHGs (mitigation) where possible, and enhances achievement of national food security and development goals

Body:

Climate-smart agriculture (CSA) is an approach for transforming and reorienting agricultural production systems and food value chains so that they support sustainable development and can ensure food security under climate change.

Relevance of CSA:

- **Increased productivity:** Produce more food to improve food and nutrition security and boost the incomes of 75 percent of the world's poor who live in rural areas and mainly rely on agriculture for their livelihoods.
- **Enhanced resilience:** Reduce vulnerability to drought, pests, disease, and other shocks; and improve capacity to adapt and grow in the face of longer-term stresses like shortened seasons and erratic weather patterns.
- **Reduced emissions:** Pursue lower emissions for each calorie or kilo of food produced, avoid deforestation from agriculture and identify ways to suck carbon out of the atmosphere.
- The climate-smart agriculture approach seeks to reduce trade-offs and promote synergies to make crop and livestock systems, forestry, and fisheries and aquaculture more productive and more sustainable.

Challenges:

- With patchy rains, crop failures become common. There is hardly any greenery in many villages, making it difficult for farmers to even maintain cattle.

- Quick adaptation for new changes is hard, with farmers varying and mixing crops across seasons, along with heavy investments in borewells, tractors, and threshers.
- Because of continuous crop failures, farmers are increasingly abandoning their lands and heading to nearby towns to find work as laborers.
- Though India is fortunate to have the monsoon, it is also uniquely vulnerable to rising temperatures, with the country ranked 14th on the Global Climate Risk Index 2019.
- India has over 120 million hectares of land suffering from some form of degradation. This has consequences, especially for marginal farmers.
- According to one estimate, they may face a 24-58% decline in household income and 12-33% rise in household poverty through exacerbated droughts.
- With rain-fed agriculture practiced in over 67% of our total crop area, weather variability can lead to heavy costs, especially for coarse grains (which are mostly grown in rain-fed areas).
- A predicted 70% decline in summer rains by 2050 would devastate Indian agriculture.
- Within 80 years, our Kharif season could face a significant rise in average temperatures (0.7-3.3°C) with rainfall concomitantly impacted, and potentially leading to a 22% decline in wheat yield in the rabi season, while rice yield could decline by 15%.

Measures needed:

- Farmers, especially smallholder farmers, need advance warning of emergent weather conditions at a local level.
- Mobile telecommunication systems are increasingly cost-effective and an efficient way of delivering weather-based agro-advisories to farmers at a large scale.
- Radio (especially community radio), television, newspapers, folk media, and village level public address systems will also need to be used to bridge this “communication divide.”
- Weather-based agro-advisories must be locale-, crop-and farmer-specific; need to also recommend soil, water, and biodiversity conservation practices.
- Build adaptive capacities to climate variability and strengthen the sustainability of farming systems.
- On-site training and awareness campaigns, technology demonstrations, farmer-specialist interactions, and engagement with local governance bodies.
- Soil health and need-based irrigation management need to be addressed adequately.
- Closer collaboration between public, civil society, and private technology and financial service providers so that farmers get access to accurate information, and affordable technologies

Conclusion:

Climate-smart agriculture is not a new agricultural system, nor a set of practices. It is an innovative approach for charting development pathways that can make the agriculture sectors more productive and sustainable and better able to contribute to climate change adaptation and mitigation.

The Wular lake, once Asia's largest freshwater lake but today little more than a big pond. In the light of above statement, discuss the challenges faced in safeguarding the lake ecosystem and provide measures. (250 words)

The Wire

Why this question:

Wular lake, once Asia's largest freshwater lake but today little more than a big pond. It once occupied an area of 272 sq. km but has since shrunk to 72 sq. km, with only 24 sq. km of open water left.

Key demand of the question:

One has to discuss the various reasons for degradation of the lake ecosystems in India and provide the measures for safeguarding the same.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

One can start off with the importance of lakes in a given environment. Further substantiate it with the context of the Wular lake itself.

Body:

Discuss the challenges faced in safeguarding the lake ecosystem?

Encroachment and increasing stress on the lake boundaries

Dumping of the solid waste, sewerage etc.

Industrial and residential effluents from the cities that discharge into the lake

spread of the invasive alligator weed is slowly destroying the beneficial vegetation growing in the lake

Increasing siltation etc.

How can this be overcome?

Conclusion:

Conclude with a way forward.

Introduction:

Lakes are kind of wetland which are areas where water is the primary factor controlling the environment and the associated plant and animal life. Healthy lakes and their shores not only provide us with a number of environmental benefits but they influence our quality of life and they strengthen our economy. Wular lake, once Asia's largest freshwater lake but today little more than a big pond. It once occupied an area of 272 sq. km but has since shrunk to 72 sq. km, with only 24 sq. km of open water left.

Body:

Challenges to the lake ecosystem:

- Lakes or wetlands near urban centres are under **increasing developmental pressure** for residential, industrial and commercial facilities. For e.g.: There are 42 villages with over nine lakh people living near Wular lake which has led to increased dumping of waste into the water, including detergents and other.

- Vast stretches of wetlands have been **converted to paddy fields**. Construction of a **large number of reservoirs, canals and dams** to provide for irrigation significantly altered the hydrology of the associated lakes.
- There is growing concern about the effect of industrial pollution on drinking water supplies and the biological diversity of lakes. For e.g.: **Industrial and residential effluents** from the cities that discharge into the Wular lake has deteriorated.
- **Increased air temperature; shifts in precipitation; increased frequency of storms, droughts, and floods; increased atmospheric carbon dioxide concentration; and sea level rise** could also affect lakes.
- The removal of material from a wetland or river bed. **Dredging of streams lowers the surrounding water table** and dries up adjacent lakes.
- Water is drained from wetlands by cutting ditches into the ground which collect and transport water out of the lakes. This lowers the water table and dries out the lakes.
- Indian lakes are threatened by **invasive alien species** – exotic introduced plant species such as water hyacinth and salvinia. They clog waterways and compete with native vegetation. E.g.: Invasive alligator weed is slowly destroying the beneficial vegetation growing in the lake.
- **Over withdrawal of groundwater** has led to **salinization of the lakes**.
- **Administrative logjam**: For e.g.: Since Kashmir is a conflict zone, anything Baba wanted to do first required him to secure permissions from the army, the navy, the Central Reserve Police Force and the local police, as well as from the Water Conservation and Management Authority set up in 2012 to clean up the lake. Wular is the only lake in India to be guarded by the national navy.

Measures to safeguard the lake ecosystem:

- Dredging of dried lake beds and tank beds in the drought affected areas.
- Implementation of Wetland Conservation measures as per Ramsar Convention.
- Digging deep trenches surrounding the lakes to avoid waste dumping, especially in urban areas.
- Exclusive missions of various state governments like Mission Kakatiya of Telangana for rejuvenating lakes, ponds and tanks.
- Rejuvenation works taken up under MGNREGA, PMKSY etc.
- New Municipal and Solid Waste Management Rules mandates segregation, recycling and reuse of waste, and emphasis on waste treatment before discharging.
- The green tribunal incentivised the states to act against polluters in a **“polluter pays” model**.
- Hefty fines, for lax state and local governments as well as private sector polluters, will go a long way in ensuring action against pollution.

Conclusion:

Without making the citizens aware of the importance and benefits of lakes and wetlands in their lives, it is extremely difficult to implement laws effectively. Stakeholder participation and capacity building must be used as an important instrument for better management of urban waterbodies.

If climate change is the defining issue of the century, the UN conference in Madrid failed miserably in galvanising action to address it. Elaborate.(250 words)

The Hindu

The Wire

Why this question:

At COP 25 in Madrid, the countries party to the Paris Agreement failed to agree on rules and procedures to govern a global carbon market, on finance for losses caused by extreme weather events, on meeting the commitments made before the agreement and on raising their ambitions. The final declaration was desultory, merely expressing serious concern at the emissions gap in seeking to limit temperature increase to 1.5° C.

Key demand of the question:

One has to discuss the reasons for failure of the COP25 meeting and the implications of failures of the talks on the planet Earth as well as the developing and small nations.

Directive:

Elaborate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

One can start off with the quoting the various facts of climate change using the scientific reports from the Intergovernmental Panel on Climate Change warning of near-certain catastrophic consequences of inaction, and an analysis from the UN Environment Programme on the gap between current greenhouse gas emissions and the limit over the coming decade.

Body:

Discuss in brief the challenges faced due to climate change effects. the real losses from extreme weather events that climate-vulnerable countries, India included, are facing with frightening regularity.

even insured losses worldwide during 2017 and 2018 together stood at a record \$225 billion

Now, discuss the various reasons for the failure of the COP25 talks. unproductive wrangle over establishing a market system to trade in carbon credits earned through reductions in emissions, with some countries eager to cash in on poorly audited emissions savings from the Clean Development Mechanism of the Kyoto Protocol that preceded the Paris pact the divergence between the developed and developing countries grew over the course of two weeks as the developed world – led by the US – blocked any attempt at a compromise using a ‘take it or leave it approach’.

Developed countries also refused to relent on the question losses suffered by developing countries due to climate impact.

What are the implications of the failure of talks?

What are the measures needed to overcome?

Conclusion:

Conclude with a way forward.

Introduction:

The UN Framework Convention on Climate Change (UNFCCC) conference (COP25) was held from 2 to 13 December 2019 in Madrid, Spain. Despite extending the meeting for 2 days, the outcome is disappointing. The countries party to the Paris Agreement **failed to agree on rules and procedures**

to govern a global carbon market, on finance for losses caused by extreme weather events, on meeting the commitments made before the agreement and on raising their ambitions.

Body:

Outcomes of the COP25:

- This year's UN talks **focused on narrow technical issues** such as the **workings of the global carbon markets**, a means by which countries can trade their successes in cutting emissions with other countries that have not cut their own emissions fast enough. However, **no agreement has been reached and the issue will be resolved next year**.
- The developed and the developing worlds had opposite views on each of these was clear from the beginning of COP25, but the divergence only grew over the course of two weeks as the developed world – led by the US – blocked any attempt at a compromise using a **'take it or leave it approach'**.
- The US was blamed for refusing to agree to developing countries' demands under what is known in the UN jargon as the **Warsaw International Mechanism (WIM)**.
- At COP25, the **developed world didn't honour CBDR**, instead pushing back against any decision, often with strong language, on the provision of finance to developing countries to help them mitigate, adapt and deal with losses due to climate change.
- It also **blocked any commitments to meet its emissions reductions under the Kyoto Protocol**, the outgoing climate regime to be replaced by the Paris Agreement next year.
- Developed countries also refused to relent on the question losses suffered by developing countries due to climate impact.
- Weary negotiators wrangled over the wording of provisions for "loss and damage", by which developing countries are hoping to receive financial assistance for the ravages they face from climate breakdown.
- Climate negotiators might have tossed the more intractable questions — **raising \$100 billion a year from 2020 for developing countries**, creating a strong framework to address loss and damage from climate events and transferring technology to poorer countries on reasonable terms
- Few countries came to this year's talks with updated plans to reach the Paris goals, though the EU finally agreed its long-term target of reaching net zero emissions by 2050.
- A **"high ambition coalition"** made up of the EU and many smaller developing countries pressed for a resolution to ask all governments to formulate stronger national plans on cutting carbon. However, **no substantive decision on future emission cuts** was made.
- After two extra days and nights of negotiations, delegates finally agreed a deal that will see new, improved carbon cutting plans on the table by the time of the Glasgow conference next year.

India's stand on the COP25:

- India played a strong role in critiquing the developed world's continuing poor record on climate action.

- It argued that unless a stocktaking exercise of the fulfillment of various pre-2020 commitments by developed countries (such as those made at Copenhagen, Cancun and Kyoto) showed that they were making significant progress, India would not raise its climate ambition for its next round of Paris Agreement targets due in 2020.
- It is entirely appropriate for countries such as India to insist on not taking on an even more unfair share of the global mitigation burden unless developed countries deliver on the minimal parameter of fulfilling their existing promises.
- India also took a lead in calling for more finance for developing countries for climate action, with the minister emphasising that “not even 2 per cent” of the promised “\$1 trillion in the last 10 years” had been delivered.

Way forward:

- All parties will need to address the gap between what the science says is necessary to avoid dangerous climate change, and the current state of play which would see the world go past this threshold in the 2030s.
- As India prepares to face calls for higher ambition in 2020 and beyond, India has to involve its States in mitigation and adaptation efforts.
- It is crucial that India continue to push developed countries in this fashion as the entire global climate action framework has been put in jeopardy by the inaction of big polluters.

As the Prime Minister advises states along the river to shift focus from Namami to Arth Ganga, it is clear that the Ganga cannot be restored by only pollution-abatement measures. Discuss. (250 words)

Down To Earth

Why this question:

Recently, the Ganga Council headed by Prime Minister (PM), in its first meeting held on December 14, 2019, floated a plan to promote sustainable agriculture in the Gangetic plain by promoting organic clusters in a five-km stretch on both sides of the Ganga basin in Uttarakhand, UP, Bihar, Jharkhand and West Bengal.

It is a good policy move, considering the cumulative use of pesticides has doubled in the last one decade and most of it runs off in our rivers. For the short-term, the five-km stretch is fine, but the government should eventually plan to stretch it to cover more area in the basin. Agriculture along the entire riverbed should be organic.

Key demand of the question

The question is about analysing the significance of Namami Gange programme and the achievements made by it. One has to further discuss the challenges faced and measures needed to set the problems straight.

Directive word

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer

Introduction:

In a few introductory lines brief upon the background and mission objectives of NMCG.

Body:

The question must discuss the following points:

The successes of NMCG so far:

Namami Gange has completed 114 projects and about 150 projects are in progress, while about 40 projects are under tendering, of which 51 sewage projects were approved before May 13, 2015 — the day Namami Gange was approved by the Union Cabinet.

Till April 2019, 1,930 MLD of sewerage treatment capacity in 97 Ganga towns has been developed, whereas the sewerage generation in these towns is 2,953 MLD.

It is further projected that the sewerage generation would touch 3,700 MLD by 2035.

The failures, challenges facing in the revival of Ganga

The industrial pollutants largely originate from tanneries in Kanpur, paper mills, distilleries and sugar mills in the Yamuna, Ramganga, Hindon and Kali river catchments.

Then, there is the huge load of municipal sewage which contributes two-thirds of total pollution load.

Water in India is a state subject and water management is not a truly knowledge-based practice.

The management of the Ganga lacked basin-wide integration and is not very cohesive between various riparian states.

Further, there is a greater challenge of upgrading the water supply and wastewater treatment infrastructure in the designated smart cities and of providing clean water supply to all rural households by 2024 under the Jal Jeevan Mission.

Critical steps needed to overcome the challenges:

Promote only decentralised sewage treatment plants (dSTP) at the colony level.

Develop and restore local storages (ponds, lakes, wetlands) as permanent solutions to both floods and droughts.

Conclusion:

Give a balanced way forward.

Introduction:

Namami Gange Programme is an umbrella programme which integrates previous and currently ongoing initiatives by enhancing efficiency, extracting synergies and supplementing them with more comprehensive & better coordinated interventions. National Mission for Clean Ganga (NMCG) endeavours to deploy best available knowledge and resources across the world for Ganga rejuvenation. Clean Ganga has been a perennial attraction for many international countries that have expertise in river rejuvenation.

Body:

Salient features of Namami Gange programme:

- River front development.
- Conservation of Aquatic life and biodiversity
- Improvement of coverage of sewerage infrastructure in habitations on banks of Ganga.
- River Surface cleaning for collection of floating solid waste from the surface of the Ghats and River
- Afforestation
- Industrial Effluent Monitoring
- Development of Ganga Gram
- Creating Public Awareness

Achievements of Namami Gange:

- Namami Gange has a well-balanced spread of 221 projects, which include STP, ghat development, surface cleaning afforestation, sanitation, and public awareness, out of which 58 have been completed.
- There is a concerted focus on 10 towns that contribute to 64% of the total sewage discharged in Ganga.
- To address the cross-functional challenge faced by GAP, Namami Gange has synergized itself with government schemes by signing MoUs with 10 central ministries.
- More than 90 per cent villages across river Ganga have been declared open defecation free, and by October 2017, the rest of the villages would become ODF as well.
- The programme has also successfully renovated over 180 ghats and built 112 new crematoriums.
- 4,464 villages situated on the bank of Ganga have been declared as open defecation free (ODF). Moreover, Namami Gange was instrumental in constructing more than 12.7 lakhs household toilets.
- Trash skimmers have been deployed in 11 cities to collect any surface waste.
- Six public outreach programmes were organised in areas around Ganga basin:
 - Swachhata Pakhwada
 - Ganga Sankalp Divas
 - Ganga Nirikshan Yatra
 - Ganga Dusshera
 - Ganga Vriksharopan Saptah
 - Swachhta Hi Seva Pakhwada

Challenges:

- According to the Central Pollution Control Board (CPCB)'s estimates, approximately 8,250 million litres per day (MLD) of wastewater is generated from towns in the Ganga basin, while treatment facilities exist only for 3,500 MLD and roughly 2,550 MLD of this wastewater is discharged directly into the Ganga.
- The industrial pollutants largely originate from tanneries in Kanpur, paper mills, distilleries and sugar mills in the Yamuna, Ramganga, Hindon and Kali river catchments.
- there is the huge load of municipal sewage which contributes two-thirds of total pollution load
- The National Green Tribunal (NGT) in November 2019 had imposed a penalty of Rs 10 crore on the Uttar Pradesh (UP) government for failing to check sewage discharge containing toxic chromium into the Ganga at Rania and Rakhi Mandi in Kanpur.
- The cost of the damage was assessed by the state pollution control board (UPPCB) as compensation for restoration of environment and the public health in the area.

- Plastic has also caused significant damage to this stretch. “Kolkata produces 2,114 tonnes of solid waste per day of which 10 per cent is plastic
- There have been issues regarding untreated waste that flows into the river, restoring the flow of the river, sludge management in Ganga basin towns, cost overruns in execution of projects and governance glitches
- CAG in its report claimed that the NMCG neither circulated Ganga Rejuvenation Basin Management Programme (GRBMP) to different ministries/departments for consultation and seeking their opinion, nor finalised the Ganga Rejuvenation Basin Management Programme (GRBMP) for initiating the long-term intervention on the Ganga.

Way forward:

- **Promote only decentralized sewage treatment plants (dSTP)** at the colony level. Reuse treated wastewater for irrigation and empty into natural drains.
- For all upcoming cities, smart cities and for those, whose master plans are not in place, earmark land for dSTPs. dSTPs below 10 MLD should be encouraged and incentivised under urban development schemes and real estate development.
- **The existing and planned STPs need to be verified on efficiency,** reliability and technology parameters by independent agencies (tech-efficiency-reliability verification).
- This will allow assessing if the technology provides value for money and is sustainable. Many STPs are not performing up to desired standards due to choice of unrealistic assumptions and erroneous technology choice.
- A survey conducted by CPCB in 2016 found that most STPs in Kanpur fail to comply with environmental regulations.
- **Develop and restore local storages (ponds, lakes, wetlands)** as permanent solutions to both floods and droughts.
- Only 10 per cent of water received during monsoon rainfall is harvested. Restoration of ponds, lakes and wetlands should be an integral part of river restoration and conservation strategy.
- **Bring back glory to all natural drains that empty into rivers,** and transform and rejuvenate them into healthy water bodies — they have been converted to sewage carrying drains by our municipalities and planning bodies.
- **Start restoring lower order streams and smaller tributaries in the Ganga Basin.** Every river is important. The focus of Ganga Action Plan (Phase I and II) and Namami Gange has been on the main stem of the river.
- The tributaries that feed the river were overlooked. The Ganga has eight major tributaries (Yamuna, Son, Ramganga, Gomti, Ghaghra, Gandak, Kosi and Damodar).
- The majority of the funds were spent on pollution-abatement measures on the main stem of the Ganga and on the upper Yamuna basin, which constitute just 20 per cent of the Ganga basin.

- Further, these eight major tributaries are joined by smaller rivers, whose restoration is equally important.
- **Identify, define and protect 'river-corridors' as areas for no cement-concrete structures** — know that rivers have been formed after thousands of years of nature's work.
- Infrastructure development and destruction of river ecosystem through populist measures such as riverfront developments in the name of area and township development projects or urban / smart city development must be stopped to protect and conserve surface water sources.
- Map the entire looped length of each and every tributary of the Ganga and correct the land records.
- Many of the rivers have been underestimated which causes encroachment and jurisdiction conflicts.
- The existing methodology to measure river length is flawed and complete mapping of looped lengths is required for proper assessment of water resources and correct revenue maps.
- This will ensure that active flood plains and river-corridors are free from encroachments.
- Restore base flows through groundwater recharge. Groundwater contributes significantly to river-flows through base flows (average base flow in the order of 40- 55 per cent) especially during lean seasons in the entire Ganga Basin.
- The idea of Ganga rejuvenation is also linked to groundwater rejuvenation. There is a **need to have robust planning and regulation of withdrawal and recharge of groundwater across all orders of the river streams to make rivers perennial.**
- **Define the desired ecological flow regime(s) in the Ganga main stem and its tributaries** (not just a static figure) to allow the rejuvenation of the river.
- Evolve new and innovative ways to generate sufficient revenues for operation and maintenance (O&M) of water and wastewater infrastructure through pricing and valuing water.

Conclusion:

Ganga is an integral part of the socio-eco-cultural-political fabric of India. However, the longest river has faced the brunt of increasing industrialization, which has not only affected the flow but also the quality of its water. Namami Gange Programme aims to restore the purity and flow of water in the Ganga River through abatement of pollutants and treatment of discharged water. Namami Gange has not only taken lessons from the failure of GAP, but, it has also ensured cross-state cooperation as well as public support to expedite the processes.

If India is to establish itself as a country of doers, containing pollution is one of the first things to be done. Discuss. (250 words)

Live Mint

Why this question:

According to a report by the Global Alliance on Health and Pollution (GAHP), based on a study that estimated the impact of contaminants in the air, water and workplace, India tops the world's chart on pollution-linked deaths, followed by China and Nigeria. More than 2.3 million premature deaths

caused by pollution were reported in India in 2017, the latest year for which the figures are available. In comparison, about 1.9 million people died in China, while in Nigeria the death count was 279,318, according to the report.

Key demand of the question

The question is about analysing the worsening pollution conditions in India and the associated concerns. Discuss about the various short-term measures undertaken by the Government and how policymakers have displayed little urgency on the matter. Provide serious measures to tackle the same.

Directive word

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer

Introduction:

In a few introductory lines brief upon the worsening pollution conditions in India and the associated concerns.

Body:

The question must discuss the following points:

Present some facts from the report, discuss the causes of the present condition.

Impact of the air pollution in Indian cities under various heads like Health, economy, society etc.

Provide for a detailed analysis of why have the problems turned into a menace and then move onto suggest measures to tackle the same.

Conclusion:

Give a balanced way forward.

Introduction:

Air pollution in India is not simply an environmental problem, but a major public health concern. It impacts all those breathing in the polluted air —children, the elderly, women and men alike. As Delhi's Air Quality Index crosses 500, the national capital has officially entered the public health emergency category.

Body:

Current air pollution scenario:

- According to a report by the Global Alliance on Health and Pollution (GAHP), based on a study that estimated the impact of contaminants in the air, water and workplace, India tops the world's chart on pollution-linked deaths, followed by China and Nigeria.
- More than 2.3 million premature deaths caused by pollution were reported in India in 2017, the latest year for which the figures are available.
- In comparison, about 1.9 million people died in China, while in Nigeria the death count was 279,318, according to the report.

Challenges posed by air pollution:

- The role of air pollution in climate change dynamics is a question that must be urgently addressed.
- For example, the importance of air pollution and greenhouse warming vs. aerosol cooling needs to be discussed with air pollution cooling, dominated by aerosol content

- Many open questions still remain, such as the measurement and monitoring of air pollution, including the exploration of new technologies and methods like remote sensing and in-situ observations.
- Air pollution also impacts historic and modern buildings and materials, affecting sites of cultural heritage by damaging structural materials of monuments, statues, and even paintings.
- Air pollution has become a year-round phenomenon particularly in north India which causes health impacts far beyond the seasonal rise of respiratory illnesses.
- It is now the leading risk factor for chronic obstructive lung disease in India, and a major contributor to pneumonia and lung cancer.
- In 2017, air pollution accounted for 12.4 lakh deaths in India, which included 6.7 lakh deaths due to outdoor particulate matter air pollution and 4.8 lakh deaths due to household air pollution.
- According to a report by the **United Nations Environment Programme (UNEP)**, India had the highest share of welfare costs (or a loss of income from labour), of about \$220 billion (about ₹1.4 trillion), in South and South-East Asia of a combined total of \$380 billion from mortality due to air pollution.
- In addition to human lives lost, there's an estimated global cost of \$225 billion in lost labour, and trillions in medical costs, Greenpeace report says.
- Government is keen to ascend the World Bank's "ease of doing business" chart, but images of people walking around Delhi in safety masks do little to attract investment.

India's actions so far:

- India's figures highlight the gravity of the crisis we face.
- While action needs to be taken, policymakers have displayed little urgency on the matter.
- Most public discourse centres on questionable short-term measures, like an odd-even scheme for private vehicles, while efforts to stop stubble-burning by farmers have yielded very few gains.
- India, however, has yet to formulate a credible policy mix that could achieve demonstrable results.
- Cases of respiratory diseases, especially among the elderly and children, are on the rise. Other health complications have arisen too.

Measures needed:

- Short term measures should be accompanied by measures that **increase the forest cover** of the land and provide farmers with an alternative to burning the remains of their crops.
- An innovative approach could be to **use climate change funds to turn farm residues into a resource**, using technological options such as converting them into **biofuels** and **biofertilizers**.
- **Proactive engagements are necessary to persuade and reassure farmers.**

- It is important to find other uses for stubble such as biomass, which may encourage farmers to look for **alternative sources of income**.
- India should at least now give high importance to the **WHO warning about air pollution being the new tobacco**. Sharply escalated, deterrent parking fees can be implemented.
- From an urban development perspective, large cities should reorient their investments to **prioritise public transport, favouring electric mobility**.
- **Incentives** for adoption of **alternate mobility technologies** should be promoted.
- The **World Bank** has said it is keen to enhance its lending portfolio to tackle air pollution, opening a new avenue for this.
- Governments should make the **use of personal vehicles in cities less attractive** through **strict road pricing mechanisms** like **Congestion tax, Green-house Gas tax**
- Need to speed up the journey towards **LPG and solar-powered stoves**.
- **Addressing vehicular emissions** is within India's grasp but requires a multi-pronged approach. It needs to combine the already-proposed tighter emission norms (in form of BS VI), with a push for shared mobility and public transport and adoption of alternate mobility technologies.
- NCAP should take precedence from emerging practices in the country—**pollution cess in Delhi on truck entry, big diesel cars, and diesel fuel sales and the coal cess**—to generate dedicated funds to finance clean air action plan.
- **Tackle road dust** by **mechanised sweeping** and **water-sprinkling** but what would be more beneficial is if the sides of the roads could be paved or covered with grass that holds the soil together and stops the production of the dust in the first place.
- Attention to non-technological aspects such as **urban planning, to reduce driving, and to increase cycling, walking, and use of public transport are needed**.

Carbon market has been a major contentious issue at Madrid climate talks, dividing the developed and developing world. What is the concept? Why was it felt necessary? And what are the major points of disagreement? Analyse. (250 words)

Indian Express

Why this question:

Almost halfway through the climate conference in Madrid, one big thing it had to resolve was the disagreements over setting up a new carbon market that has remained contentious as ever. Thus the question aims to analyse the concept of carbon market in such pretext.

Key demand of the question:

One must provide for a detailed analysis of carbon markets and examine the mechanism in detail along with the associated pros and cons.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

In first, explain the context of the question.

Body:

Carbon markets, which allow for buying and selling of carbon emissions with the objective of reducing global emissions, is an unfinished agenda from last year's meeting in Katowice, Poland. Under the Paris Agreement, every country has to take action to fight climate change. These actions need not necessarily be in the form of reduction in greenhouse gas emissions, which can constrain economic growth.

Explain then – what the points of contention are; the main tussle is over two or three broad issues — what happens to carbon credits earned in the Kyoto regime but not yet sold, what constitutes double-counting, and transparency mechanisms to be put in place.

Discuss the major points of disagreements.

Suggest way forward.

Conclusion:

Conclude that Carbon markets are not compulsorily essential to the implementation of Paris Agreement. But with the world doing far less than what is required to prevent catastrophic impacts of climate change; the markets can be an important tool to close the action gap

Introduction:

Carbon markets, which allow for buying and selling of carbon emissions with the objective of reducing global emissions, is an unfinished agenda from last year's meeting in Katowice, Poland. Carbon markets also existed under the Kyoto Protocol, which is being replaced by the Paris Agreement next year. The market mechanisms being proposed under the Paris Agreement are conceptually not very different, but are supposed to have more effective checks and balances, and monitoring and verification processes.

Body:

Carbon market mechanism and its necessity:

- Carbon Markets can potentially deliver emissions reductions over and above what countries are doing on their own.
- Under the Paris Agreement, every country has to take action to fight climate change. These actions need not necessarily be in the form of reduction in greenhouse gas emissions, which can constrain economic growth.
- Only the developed countries have included absolute emission cuts in their action plans. Yet, there is scope for absolute emissions reductions in developing countries too.
- Markets can potentially deliver emissions reductions over and above what countries are doing on their own.
- For example, technology upgradation and emission reduction of a brick kiln in India can be achieved in two ways:
 - A developed country which is unable to meet its reduction target can provide money or technology to the brick kiln in India, and thus claim the reduction of emission as its own.
 - Alternatively, the kiln can make the investment, and then offer on sale the emission reduction, called **carbon credits**. Another party, struggling to meet its own targets, can buy these credits and show these as their own.

Carbon markets provisions under Paris agreement:

- The provisions relating to setting up a new carbon market are described in Article 6 of the Paris Agreement.
- Article 6.2 enables bilateral arrangements for transfer of emissions reductions.
- Article 6.4 talks about a wider carbon market in which reductions can be bought and sold by anyone.
- Article 6.8 provides for making 'non-market approaches' available to countries to achieve targets.

Contentious points of Carbon Markets:

- The main tussle is over two or three broad issues — what happens to carbon credits earned in the Kyoto regime but not yet sold, what constitutes double-counting, and transparency mechanisms to be put in place.
- Developing countries have several million unsold CERs (certified emission reductions), each referring to one tonne of carbon dioxide equivalent emission reduced, from the Kyoto regime. Under the Kyoto Protocol, only developed countries had the obligation to reduce emissions. In the initial phase, some of these were interested in buying CERs from projects in India or China, which were not obliged to make reductions.
- In the last few years, several countries walked out of the Kyoto Protocol, and those that remained did not feel compelled to full their targets. The second commitment period of the Kyoto Protocol (2012-20) never came into force. As the demand for CERs crashed, countries like India were left with projects generating CERs with no one to buy them.
- India has about 750 million unsold CERs and, along with other similarly robust; they want the new mechanism to start with a clean slate.
- The second issue is that of double counting, or corresponding adjustment. The new mechanism envisages carbon credits as commodities that can be traded multiple times among countries or private parties. It is important to ensure that in this process, credits are not counted at more than one place; whoever sells carbon credits should not simultaneously count these as emissions it has reduced.
- The developing countries argue that the country that reduced emissions should be able to show it even after selling the credits, and that adjustments should be made only for subsequent transfers, if any.

Way forward:

- Carbon markets are not essential to the implementation of Paris Agreement.
- However, the carbon market system must evolve towards something better than offsetting. It should aim to accelerate the transition, rather than offering a cheap way out and replacing somebody's efforts with those of someone else.
- The world should move away from offsetting mechanisms and towards financing climate projects that truly drive the zero-carbon transition.
- One way of achieving this is to use existing carbon markets to disburse climate finance by buying carbon credits and cancelling them, without claiming the actual emission reductions.

Provided the lack of effectiveness of the current global climate policy the alternative strategy of the low carbon social development model adopted by India and China needs more consideration. Examine.(250 words)

The Hindu

Why this question:

The question is in the context of United Nations Framework Convention on Climate Change's 25th Conference of Parties that was held in Madrid recently.

Key demand of the question:

The article highlights the alarming concerns related to the current global climate policy and demands an analysis of what needs to be done to address the same.

Directive:

Examine – When asked to 'Examine', we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

In short highlight the key facts from the article.

Body:

Explain the key factors responsible for the failure of the current global climate policy – the world's major emitter, the US has rejected multilateralism, premised on burden-sharing and has pulled out of the Paris climate deal. The planned emission cuts fall short of what needs to be done to contain global warming.

The existing Nationally Determined Contributions filed under the Paris Agreement fall short. There is a yawning gap between planned emissions cuts, and what needs to be done by 2030 to contain global temperature rise at 1.5°C etc.

Present the case of India and China and highlight some specific efforts in this direction by the two.

Conclusion:

Conclude that by 2040 more than half of the global wealth is again going to be in Asia; the low carbon social development model adopted by India and China will become the world system, ensuring global sustainability. The alternative strategies led by India and China should now move centre stage and replace the ineffective Climate Treaty.

Introduction:

The failure to limit the increasing levels of concentration of greenhouse gases despite the annual Climate Summits raises questions on the efficacy of the current global climate policy. The current global climate policy problem is that the Climate Treaty considers symptoms (emissions of greenhouse gases), rather than the causes (use of natural resources). India, which is responsible for just 3% of cumulative emissions, is the most carbon efficient and sustainable major economy.

Body:

Failures of the current global climate policy:

- USA, the world's major emitter, has rejected multilateralism, premised on burden-sharing and has pulled out of the Paris climate deal.
- The planned emission cuts fall short of what needs to be done to contain global warming.
- The existing Nationally Determined Contributions (NDC) filed under the Paris Agreement fall short.

- There is a huge gap between planned emissions cuts, and what needs to be done by 2030 to contain global temperature rise at 1.5°C.
- The European Union's ambition of 'net' zero emissions by 2050 neglects the needed societal change by ignoring the embedded carbon in its imports which accounts for a third of their emissions of carbon dioxide.

Varying resource utilization patterns:

- Excessive resource use by the West which constitutes 20% of the world's population consumes half of the global material use and is the major cause of climate change.
- Asia with half the world's population is responsible for less than half of the material use.
- The contribution of the United States to resource use or cumulative emissions of carbon dioxide peaked at 40% in 1950, declined to 26% and is likely to remain at this level.
- By 2015, the global population had doubled when emissions in China began to stabilise and accounted for 12% of the total cumulative emissions. Asia and Africa will peak at per-capita levels that are a third of those of the West.
- The developed world by failing to acknowledge its historical contribution to the issue of climate change is shifting the burden of controlling climate change onto developing countries.
- National natural resource-use accelerated in two distinct phases with very different origins and impacts.
- In North America and Europe, resource use accelerated after 1950, and not with industrial resource use from 1850. By 1970, three-quarters of their population had moved to cities, characterized as "unprecedented prosperity", leading to the trajectory towards climate change.

Model adopted by India and China:

- India and China, civilizational states with a population nearly eight times that of the U.S., have re-defined progress.
- Measures for global sustainability should draw lessons from India and China.
- India, which is responsible for just 3% of cumulative emissions, is the most carbon-efficient and sustainable major economy.
- The pathway adopted by China can now be compared and contrasted with the West, as it has come up to that level of urbanization and well-being.
- In China, electricity consumption per capita is a third of the European Union (EU) and a sixth of the U.S. Residential energy consumption has increased at a rate less than half the increase in GDP, and corresponds to the increase in urban population, showing a limited increase with more disposable household income.
- China also has less than a sixth of the number of cars with respect to population, than the EU, while the U.S. has nearly two times that number. In China, nearly 40% of the distance travelled is by public transport, which is two times that of the EU. While the number of cars in China is projected to double by 2040, half the new cars are expected to be electric vehicles.

- China has the world's most extensive electric high-speed rail system. In Beijing, three-quarters of public transport buses are already electric. Asian household savings as a per cent of GDP are two times that of the U.S.
- India and China are global leaders in sustainability not only because of their low per-capita resource use but also because of their commitment to peak oil consumption around 2035 as they adopt electric vehicles supported by solar and wind renewable energy.
- By 2035, India and China are expected to have half the global renewable capacity and electric vehicles.

Conclusion:

Transport emissions are the fastest growing emissions worldwide, projected to become half of global emissions. India and China are global leaders in sustainability not only because of their low per-capita resource use but also because of their contribution to peak oil around 2035 as they adopt electric vehicles supported by solar and wind renewable energy. The low carbon social development model adopted by India and China will become the world system, ensuring global sustainability.

Role of external state and non-state actors in creating challenges to internal security.

While radicalisation is the primary problem, lone-wolf terror attacks across globe points to security, intelligence and systemic failures. Examine. Suggest how India should prepare itself to avoid such attacks.

The Hindu
IDSA

Why this question:

The recent knife attack near London Bridge that killed two and injured three others is yet another reminder of the threat lone-wolf assaults pose to public security.

Key demand of the question:

One has to talk about the various reasons for increasing lone-wolf terror attacks and the measures needed to curb such attacks.

Directive:

Examine – When asked to 'Examine', we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Briefly narrate the lone-wolf attack in London. Also explain about the instances in India and world in the past.

Body:

Explain that a lone wolf attack is undertaken by a very small group or an individual in support of a larger cause, but without the overall supervision or support of a terrorist organisation.

Discuss the causes for rising lone-wolf terror attacks.

Radicalization of the youth- individuals who are influenced by either perceptions of injustice and persecution.

Lax gun controls in some places.

Failure of the intelligence of State

Other reasons.

Give measures to tackle such incidents in India like addressing the systemic issues — making policing more efficient; strengthening the intelligence network; state agencies need to work with civil society groups as well as community leaders and have deradicalisation programmes etc.

Conclusion:

Conclude about how there is no one-stop solution to terrorism and the need for global co-operation in fighting it.

Introduction:

The knife attack on recently near London Bridge that killed two and injured three others is yet another reminder of the threat lone-wolf assaults poses to public security.

A lone wolf, lone-wolf terrorist, or lone actor, is someone who prepares and commits violent acts alone, outside of any command structure and without material assistance from any group. He or she may be influenced or motivated by the ideology and beliefs of an external group and may act in support of such a group. In its original sense, a “lone wolf” is an animal or person that generally lives or spends time alone instead of with a group.

Challenges to Undertaking Lone Wolf Attacks

- Unlike in the US where sophisticated weapons can be easily bought by ordinary citizens, gaining access to such weaponry in India is difficult as is the ability to obtain licenses.
- Indians have not displayed the psychological willingness to undertake high risk attacks. There have not been any fidayeen attacks undertaken by Indians in the country. Such attacks in the past have either been undertaken by Tamil guerrillas from Sri Lanka or by Pakistan-sponsored foreign terrorists in Jammu and Kashmir.
- The only major indigenous terrorist group which has operated on a pan-Indian scale is the Indian Mujahideen (IM). There is a possibility that radicals associated with this group might attempt lone wolf strikes especially given that one of IM’s breakaway factions has joined the IS.
- Over a period of time, the deployment of private security at high value targets like malls, hotels and schools has been upgraded, which acts as a deterrent to an individual aiming to target them.
- The absence of past examples of lone wolf attacks in India inculcates the fear of the unknown in the minds of potential volunteers.
- The areas most affected by communal tensions and differences between religious groups can best be identified on the basis of the history of riots. States that have witnessed the maximum number of cases of communal riots include Uttar Pradesh, Madhya Pradesh, Maharashtra, Gujarat and Karnataka.

India’s Vulnerabilities:

- Past cases of terrorist attacks suggest that the reactions of the local police remain inadequate. While this was clearly apparent during 26/11, which was a well-orchestrated attack sponsored by Pakistan, responses to subsequent terror attacks do not indicate police capacities that are necessary for undertaking clinical operations to limit potential damage.

- Heavy concentration of people in public areas offers a large number of potential targets. While some installations have utilised the limited protection offered by private security measures, a large number of public places continue to remain vulnerable.
- A fast growing population, especially youth with access to mass media and social media, opens limitless avenues of unrestrained radical propaganda. This increases the possibility of subversion, given the unverified yet powerful platforms of messaging that promise liberation from everyday frustrations of the youth at their places of work, in society and across borders in conflict zones.
- While the popular discourse seems to suggest an increasing level of intolerance, the reality is quite different. For instance, the number of incidents of communal violence increased only marginally from 644 in 2014 to 650 in 2015 (based on data till October, 2015).

How India should prepare itself to avoid such attacks.

- The approach must follow the sequence of awareness of the contagion, detection of potential and existing recruits and finally remedial action.
- The recent attacks in France and the large scale recruitment to IS has contributed to raising awareness regarding radicalization the world over. However, there is a need to focus attention on potential target groups through monitoring and infiltration of social media sites that are the principle source of radical propaganda.
- Big data analytics must be used to discern the level of radicalization of potential recruits, their networks and sources of information, funding and leadership in order to help unravel the roots of radicalization.
- The police and intelligence services are neither trained nor equipped to handle the vital aspect of rolling back radicalization in society. Helplines should be created and manned by professional counsellors and psychologists who can help reverse the process as part of the efforts of Non-Governmental Organizations (NGOs) supported by the state.
- While the above is a suitable course of action for potential and raw recruits, the hardened ideologues must be prosecuted under the counter terrorism laws of the state.
- The example of the IS suggests that their legal advisors carefully exploited existing loopholes and gaps in legal mechanisms to continue with propagation of radical ideologies in Europe. This raises the need for regular revision and tightening of laws to ensure that the same cannot be attempted in India.
- The formation of National Security Guard regional hubs in the aftermath of 26/11 is a welcome step to neutralize future terrorist strikes. However, recent attacks indicate that the reaction time to a terror strike is likely to be of the utmost essence in minimizing casualties. There is, therefore, a need for specialized police teams to be trained and organized in every state to act as first-responders.
- The nature of threat that groups like the IS represent is transnational in nature. Therefore, the momentum created in the aftermath of the Paris attacks must be carried forward to strengthen the “coalition of willing” to improve intelligence sharing mechanisms, reduce time for processing information requests, strengthen countering the finance of terrorism measures, and facilitate the extradition of hate mongers from their chosen place of

immigration. The example of Sikh and Kashmiri groups in Europe and Canada is a case in point.

Conclusion:

Attacks by home grown terrorists is a threat that has proved its nefariousness in the recent past. This is likely to be expanded through volunteers encouraged to undertake lone wolf attacks. India remains an important target for groups like the IS, which visualize the country's democratic, secular and open social fabric as a threat to their concept of an Islamic Caliphate. It is therefore important to undertake suitable proactive measures to limit the potential damage that can be caused by such attacks.

Challenges to internal security through communication networks, role of media and social networking sites in internal security challenges, basics of cyber security; money-laundering and its prevention

Critically analyse the provisions of Personal Data Protection Bill which seeks to update the currently non-existent standards for privacy and consent.

[Deccan Herald](#)

[Livemint](#)

[The Economic Times](#)

Why this question:

The government has listed the Personal Data Protection Bill in Parliament for the winter session. The Union Cabinet has approved the Bill and it is likely to be introduced for discussion before the on-going winter session of Parliament. It is essential to discuss the bill and its effect on freedom of individuals. Finally we need to provide a fair and balanced opinion on the provisions of the draft Bill and discuss the way forward.

Directive word

Critically examine – When you are asked to examine, you have to probe deeper into the topic, get into details, and find out the causes or implications if any. When 'critically' is suffixed or prefixed to a directive, all you need to do is look at the good and bad of something and give a fair judgement.

Structure of the answer

Introduction – Give a background of the data protection Bill and talk about the challenges emanating for RTI Act from all corners

Body

Highlight the provisions of the data protection bill

One of the most important aspects of the Bill is the setting up of the data protection authority (DPA). the bill proposes social media platforms to create a mechanism so that for "every user who registers their service from India or uses their service from India, a voluntary verifiable account mechanism has to be made

And so on.

Highlight the challenges posed by the bill.

The Bill calls for privacy by design, but ensuring accountability will be difficult since most design decisions are opaque

While the draft Bill sets up broad principles for privacy, a huge chunk of the work has been left for the DPA to carry forward.

in the interest of national security, certain agencies can have access to personal data for any investigation pertaining to offences.

The Personal Data Protection Bill only lists a set of broad principles that lay down the contours of privacy in the country. That in itself offers neither a clear road map for governance nor any of the

details that data principals, and fiduciaries alike, would need in order to understand their rights and obligations

And so on.

Provide measures to tackle the challenges posed.

Conclusion

Give a fair and balanced conclusion and discuss the way forward.

Introduction:

The Union cabinet recently gave its approval to the Personal Data Protection Bill that seeks to lay down a legal framework to preserve the sanctity of “consent” in data sharing and penalize those breaching privacy norms. The Bill will update the currently non-existent standards for privacy and consent. The Bill is based on the previous draft version prepared by a committee headed by retired **Justice B N Srikrishna**.

Body:

Decoding the data protection bill

WHAT IT MEANS FOR CONSUMERS

- **DATA** can be processed or shared by any entity only after consent.
- **SAFEGUARDS**, including penalties, introduced to prevent misuse of personal data.
- **ALL** data to be categorized under three heads—general, sensitive and critical.

THE GOVERNMENT & REGULATORY ROLE

- **GOVT** will have the power to obtain any user's non-personal data from companies.
- **THE** bill mandates that all financial and critical data has to be stored in India.
- **SENSITIVE** data has to be stored in India but can be processed outside with consent.

WHAT COMPANIES HAVE TO DO

- **SOCIAL** media firms to formulate a voluntary verification process for users.
- **SHARING** data without consent will entail a fine of ₹15 crore or 4% of global turnover.
- **DATA** breach or inaction will entail a fine of ₹5 crore or 2% of global turnover.

Source: Mint research

Proposals of the PDP Bill:

- The Bill calls for the creation of an **independent regulator Data Protection Authority**, which will oversee assessments and audits and definition making.
- Each company will have a **Data Protection Officer (DPO)** who will liaison with the DPA for auditing, grievance redressal, recording maintenance and more.
- The Bill trifurcates data as follows:
 - **Personal data:** Data from which an individual can be identified like name, address etc..
 - **Sensitive personal data (SPD):** Some types of personal data like as financial, health, sexual orientation, biometric, genetic, transgender status, caste, religious belief, and more.

- **Critical personal data:** Anything that the government at any time can deem critical, such as military or national security data.
- The Bill **removes the requirement of data mirroring** (in case of personal data). Only individual consent for data transfer abroad is required.
- The Bill requires **sensitive personal data** to be stored only in India. It can be processed abroad only under certain conditions including approval of a Data Protection Agency (DPA).
- **Critical personal data** must be stored and processed in India.
- The Bill mandates fiduciaries to provide the government any **non-personal data** when demanded. It refers to anonymised data, such as traffic patterns or demographic data.
- The previous draft did not apply to this type of data, which many companies use to fund their business model.
- The Bill also requires **social media companies**, which are deemed **significant data fiduciaries** based on factors such as volume and sensitivity of data, to develop their own user verification mechanism.
- This intends to decrease the anonymity of users and prevent trolling.
- The Bill includes exemptions for processing data without an individual's consent for "reasonable purposes", including security of the state, detection of any unlawful activity or fraud, whistleblowing, medical emergencies, credit scoring, operation of search engines and processing of publicly available data.
- The Bill proposes "**Purpose limitation**" and "**Collection limitation**" clause, which limit the collection of data to what is needed for "clear, specific, and lawful" purposes.
- It also grants individuals the right to data portability and the ability to access and transfer one's own data. It also grants individuals the right to data portability, and the ability to access and transfer one's own data.
- It legislates on **the right to be forgotten**. With historical roots in European Union law, General Data Protection Regulation (GDPR), this right allows an individual to remove consent for data collection and disclosure.
- The Bill stated the **penalties** as: Rs 5 crore or 2 percent of worldwide turnover for minor violations and Rs 15 crore or 4 percent of total worldwide turnover for more serious violations.
- Also, the company's executive-in-charge can also face jail terms of up to three years.

Challenges posed:

- A common argument from government officials has been that data localisation will help law-enforcement access data for investigations and enforcement.
- Critical data will be defined by the government from time to time and has to be stored and processed in India
- National security or reasonable purposes are an open-ended terms, this may lead to intrusion of state into the private lives of citizens.

- Technology giants like Facebook and Google have criticised protectionist policy on data protection.
- They fear that the domino effect of protectionist policy will lead to other countries following suit.
- Protectionist regime suppress the values of a globalised, competitive internet marketplace, where costs and speeds determine information flows rather than nationalistic borders.
- Also, it may backfire on India's own young startups that are attempting global growth, or on larger firms that process foreign data in India.
- Civil society groups have criticised the open-ended exceptions given to the government in the Bill, allowing for surveillance.
- Moreover, some lawyers contend that security and government access are not achieved by localisation.
- There have only been limited studies on privacy in the Indian context but the most existing literature points to the collectivist nature of society to explain the low levels of privacy consciousness.
- While awareness is growing, if people display a high level of apathy towards ensuring the protection of their personal data it may push data fiduciaries down the path of non-compliance.

Way forward:

- The government should table the Bill at the earliest to allow sufficient time for discussing the finer aspects of the Bill on the floor of the house.
- The number of questions posed to MEITY on the topic of privacy and data protection indicates a high degree of interest in Parliament on the subject.
- The government should also endeavour to remain as transparent as possible when framing the remaining provisions.
- Simultaneously, society should not slide into complacency after the passage of the Bill.
- Instead, it must continue to stay engaged to ensure that we have a strong data protection regime that succeeds in safeguarding Indians' fundamental right to privacy.

India is widely considered to be a world leader in cutting off access to the Net. Critically discuss the issues and concerns raised against pre-emptive internet shutdowns as a security measure. (250 words)

Indian Express

Why this question:

The Software Freedom Law Center (SFLC), the global tracker for Internet shutdowns, was inundated with messages of shutdowns across the country — a frequently recurring phenomenon in India over the past several years. The world's fastest growing Internet market is also the global leader by far in cutting off access to small and large sections of its population.

Key demand of the question

The question expects us to explain the concerns caused due to shut down of internet by the Government under the garb of maintenance of Internal Security. Further, explain the concerns

faced

Directive word

Critically discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments. When ‘critically’ is suffixed or prefixed to a directive, all you need to do is look at the good and bad of something and give a fair judgement.

Structure of the answer

Introduction:

Provide a brief outlook on the internet shutdowns in India recently. Discuss about the laws and the provisions under which it can be applied.

Body:

Discuss the reasons for which the internet shutdown is clamped by authorities

- *To stop the unrest or communal violence from perpetuating*
- *To deter the influence of non-state actors and miscreants in shaping the future course of unrest.*
- *And so on.*

However, the clampdown of internet has other effects too like:

- *curtails the democratic principles and implicitly the fundamental rights of freedom and liberty*
- *economic cost to shutdowns is immense: Over the past five years, some 16,000 hours of Internet shutdowns cost the economy a little over \$3 billion*
- *and so on.*

Provide the possible measures to tackle this.

Conclusion:

Give a balanced way forward.

Introduction:

The Software Freedom Law Center (SFLC), the global tracker for Internet shutdowns, was inundated with messages of shutdowns across the country — a frequently recurring phenomenon in India over the past several years. Recently as protests over a controversial citizenship law rage across India, authorities resorted to shutting down the internet in cities where demonstrators flooded the streets. **A country that is now seen as the internet shutdown capital of the world.**

Body:

Recent internet shutdowns in India:

- **136 days and counting:** Internet services were suspended on 4 August in Jammu and Kashmir this year
- **133 days:** An internet shutdown in Indian-administered Kashmir which lasted from 8 July to 19 November in 2016
- **99 days:** Authorities shut off the internet in India’s West Bengal state from 18 June to 25 September in 2017
- Most internet shutdowns in India are ordered under article 144 of the Indian Penal Code, which empowers local authorities to issue prohibitory orders to deal with situations of potential unrest. (Software Freedom Law Center)
- The current sweeping shutdowns come after access to the Internet was cut off as a preventive measure in several states last month ahead of the Supreme Court’s Ayodhya verdict, when there were apprehensions of tension and violence

- The Internet was suspended around the death anniversary of the slain Hizbul Mujahideen commander Burhan Wani, and on Independence Day 2017, Republic Day 2016, and Eid 2015.

Type of Shutdown:

Of the 278 Internet shutdowns recorded between January 2012 and January 2019, 160 were observed to be preventive measures i.e. restrictions imposed in anticipation of law and order breakdowns, whereas 118 shutdowns were reactive in nature i.e. imposed in order to contain on-going law and order breakdowns.

Nature of Shutdown:

Of the 278 reported incidents, 224 were targeted at mobile Internet services alone (3 in 2012, 5 shutdowns each in 2013 & 2014, 8 in 2015 and 20 in 2016, 51 in 2017, 126 in 2018 and 6 till January 2019), 19 targeted both mobile and fixed-line Internet services (4 each in 2015 and 2016, 9 in 2017, and 4 in 2018), while only 2 shutdowns targeting fixed-line services alone were recorded during the period of study.

Issues and concerns involved:

- Shutdown is a violation of fundamental rights of Freedom of speech and expression.
- Internet shutdowns can erode democratic institutions and values. For example, if citizens are using the internet to mobilize themselves, then shutting down the internet is not different from suppressing dissent.
- Does a democratic government have the right to shut down the internet? Is a basic question regarding internet shutdown. After the Gujarat government suspended internet services for almost a week during the Patidar protest in 2015, the matter was taken to the courts.

- Internet shutdowns are not particularly effective—people always find other ways to communicate, and studies have shown that such censorship in times of political unrest actually leads to more violent uprisings as the information void fuels uncertainty and causes panic.
- The Internet is pretty much a basic human right, even if not legally defined as such, for most parts of the world — without access to the virtual world, a very large number of vital human activities simply stop.
- In countries that have “medium” Internet penetration — 49% to 79% of the population — a shutdown could dent daily economic activity by \$6.6 million per 10 million people, according to an analysis by Deloitte, quoted in The New York Times article.
- Between July 2015 to June 2016, Internet shutdowns caused global losses of more than \$2.4 billion, according to an analysis by The Brookings Institution quoted in the same article.
- Over the past five years, some 16,000 hours of Internet shutdowns cost the economy a little over \$3 billion, according to estimates in a report by the Indian Council for Research on International Economic Relations (ICRIER).
- Cutting off communication in itself is an enormous public safety risk. Citizens are left without access to information about emergency services like the volunteer-built solutions like chennairains.org.
- Because internet shutdowns affect every section of society – especially those who need it the most. And these restrictions, targeting the ‘common people’, are becoming increasingly ‘common’.

Way forward:

- Perhaps the solution can be found in renegotiating our law enforcement approaches in keeping with the changing times and technologies.
- Police and government agencies could increase their presence online so that they can actively fight back against rumour-mongering.
- Empowering local law enforcement so they can tackle tensions without shutting the Internet down.
- The solution to internet misuse is to build stronger laws for data privacy and protection. Stopping access to internet services altogether is definitely not the solution.
- Social media can be the solution, not just the problem: Particularly in the Kaveri River water dispute, the Bangalore police used texts, Twitter, and Facebook to send out information on emergency contacts to reassure people.

On a resolution on **“The promotion, protection and enjoyment of human rights on the Internet”**, the UN Human Rights Council, guided by the Charter of the UN, said it was **“deeply concerned by all human rights violations and abuses committed against persons for exercising their human rights and fundamental freedoms on the Internet, and by the impunity for these violations and abuses”, and “also by measures aiming to or that intentionally prevent or disrupt access to or dissemination of information online, in violation of international human rights law”**.

Conclusion:

Shutdowns, which are a negative expression of the idea of digital sovereignty, are not just for undemocratic societies any more. An internet shutdown compromises our democratic freedoms and should only be allowed in the rarest cases, rather than as a first response. Also an independent body could be a substitute for legislation which impose shutdown arbitrarily and that it also be empowered to review the necessity of shutdowns in the first place.

In the twentieth century, India saw an impetus in Information Technology (IT) and an enormous growth in e-commerce. Amidst such a scenario discuss the possible cyber security threats India is facing today. Also, comment upon India's preparedness to avert such cyber security threats. (250 words)

Reference: Indian Express

Why this question:

While the number of cybercrimes in the city is on the rise, incidents of people being defrauded over promises of winning an online lottery, or availing services of a dating website, have become a cause for concern.

Key demand of the question:

Explain the possible concerns of cyber security threats posing the country, discuss what needs to be done to handle them and specifically provide for a detailed discussion on solutions to address.

Directive:

Comment– here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

Explain some recent cyber breaches to substantiate the question.

Body:

Explain why cyber security breaches are dangerous, what are the key concerns.

Discuss that in twentieth century, India saw an impetus in Information Technology (IT) and an enormous growth in e-commerce. Both these sectors ride on and reside in cyberspace involving electronic transactions, software, services, devices and networks which are highly susceptible to cyber-crimes. Hence to ensure its safety, cyber-security has become one of the most compelling priorities for the country.

Discuss the need for cyber security.

Explain the challenges; discuss the efforts taken by the government to tackle the security issues on this front.

Conclusion:

Conclude with solutions to address the issue.

Introduction:

Cybercrime is a criminal action that encompasses mobile phones, laptop, network, and computer. It is a threat to country's external and internal security and monetary status. Crimes committed against publics with an illicit intention to cause physical or psychological harm, or loss to the victim directly or indirectly, by means of contemporary telecommunication networks such as social media network, the Internet and mobile phones. As per numbers obtained from Pune City Police, the Cyber Crime Cell has received 37 complaints of online lottery frauds and 32 on online dating frauds so far this year.

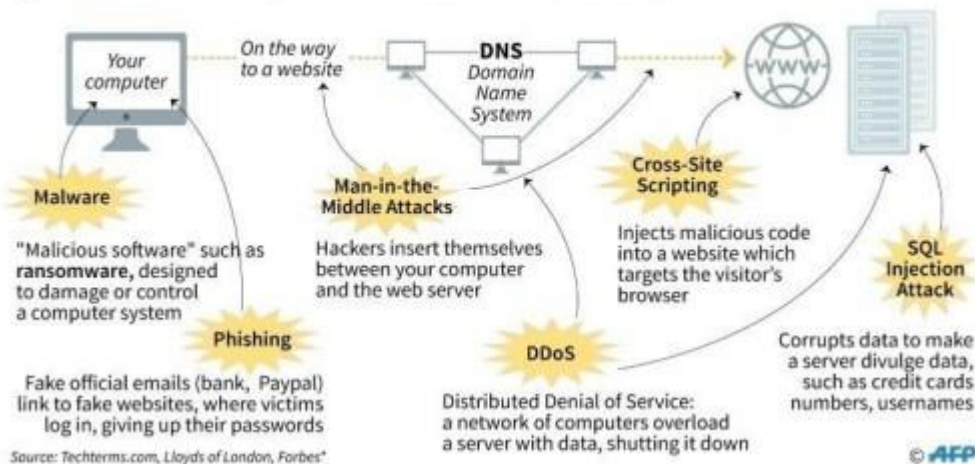

Body:

Types of cyber security threats: Cyber Security is protecting cyber space including critical information infrastructure from attack, damage, misuse and economic espionage.

The different types of cyber attacks

Cyber crime worldwide cost \$400 billion in 2015 and is forecast to reach \$2 trillion in 2019*

Cyber frauds and their modus operandi:

- online fraudsters manage to collect a large amount of information about their potential victims.
- A huge amount of data, like phone numbers and email addresses, is collected in different ways.
- For example, asking someone to fill a form for some lottery prize in a mall or at a petrol pump.
- This bulk data is sold to cyber fraudsters, who then contact these people by making phone calls, sending SMSs and emails etc about fraudulent schemes like online lotteries.
- Fraudsters often ask their targets to transfer money into different bank accounts as various 'charges' for receiving the lottery prize, availing dating services and other fake reasons.
- cyber criminals lure people from poor backgrounds to open such accounts in different banks, and then keep their ATM cards.
- After money is transferred by the victims to the 'beneficiary' bank accounts, fraudsters withdraw it immediately. Some part of the money is given to 'beneficiary' account holders.

India's attempts to tackle these issues:

Information Technology Act, 2000

- The act regulates use of computers, computer systems, computer networks and also data and information in electronic format.
- The act lists down among other things, following as offences:
- Tampering with computer source documents.
- Hacking with computer system

- Act of cyber terrorism i.e. accessing a protected system with the intention of threatening the unity, integrity, sovereignty or security of country.
- Cheating using computer resource etc.

Strategies under National Cyber Policy, 2013

- Creating a secure cyber ecosystem.
- Creating mechanisms for security threats and responses to the same through national systems and processes.
- National Computer Emergency Response Team (CERT-in) functions as the nodal agency for coordination of all cyber security efforts, emergency responses, and crisis management.
- Securing e-governance by implementing global best practices, and wider use of Public Key Infrastructure.
- Protection and resilience of critical information infrastructure with the National Critical Information Infrastructure Protection Centre (NCIIPC) operating as the nodal agency.
- NCIIPC has been created under Information Technology Act, 2000 to secure India's critical information infrastructure. It is based in New Delhi.
- Promoting cutting edge research and development of cyber security technology.
- Human Resource Development through education and training programs to build capacity.

Cyber Surakshit Bharat Initiative: It was launched in 2018 with an aim to spread awareness about cybercrime and building capacity for safety measures for Chief Information Security Officers (CISOs) and frontline IT staff across all government departments.

National Cyber Security Coordination Centre (NCCC): In 2017, the NCCC was developed. Its mandate is to scan internet traffic and communication metadata (which are little snippets of information hidden inside each communication) coming into the country to detect real-time cyber threats.

Cyber Swachhata Kendra: In 2017, this platform was introduced for internet users to clean their computers and devices by wiping out viruses and malware.

Training of 1.14 Lakh persons through 52 institutions under the Information Security Education and Awareness Project (ISEA) – a project to raise awareness and to provide research, education and training in the field of Information Security.

International cooperation: Looking forward to becoming a secure cyber ecosystem, India has joined hands with several developed countries like the United States, Singapore, Japan, etc. These agreements will help India to challenge even more sophisticated cyber threats.

Preventive measures:

- citizens should avoid submitting details like bank account numbers, ATM card numbers and other information with strangers or any unknown person over the phone.
- Suspicious online offers and messages, or emails sent by unknown persons, should be ignored.

- Citizens should report to the police any suspicious contact numbers and emails that offer fraudulent schemes.
- No money transfers should be made to any bank account without confirmation about the scheme offered online by any website.

Way forward:

- Real-time intelligence is required for preventing and containing cyber-attacks.
- Periodical 'Backup of Data' is a solution to ransomware.
- Using Artificial Intelligence (AI) for predicting and accurately identifying attacks.
- Using the knowledge gained from actual attacks that have already taken place in building effective and pragmatic defence.
- Increased awareness about cyber threats for which digital literacy is required first.
- India needs to secure its computing environment and IoT with current tools, patches, updates and best known methods in a timely manner.
- The need of the hour for Indian government is to develop core skills in cyber security, data integrity and data security fields while also setting stringent cyber security standards to protect banks and financial institutions.

Various Security forces and agencies and their mandate.

What is Blue Water Force? Discuss the significance for India as she aspires to be a net security provider in the Indian Ocean region.

The Indian Express

Why this question:

Mankind's progress has had unintended consequences on the environment. These include climate change, extreme weather events and the reduced availability of potable water.

Key demand of the question:

One has to find the reasons for reduced availability of potable water due to human actions, climate change and extreme weather events.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define what is blue water force and explain the context of our defence minister declaring it.

Body:

Discuss what is blue water navy.

Discuss the need and significance to Develop 'Blue Water' Capabilities for India?

What are the challenges faced in the quest?

How can this be overcome?

Conclusion:

Conclude with a way forward.

**Introduction:**

On December 4, Navy Day, the office of Defense Minister stated that “Indian Navy is the Formidable Blue Water Force.” **Blue Water Navy** is one that has the capacity to project itself over a much bigger maritime area than its maritime borders. Simply put, it is a Navy that can go into the vast, deep oceans of the world. However, while most navies have the capacity to send ships into the deep oceans, a Blue Water Force is able to carry out operations far from its borders, without being required to return to its home port to refuel or re-stock.

Body:**How does a nation become a part of this?**

- A blue-water navy implies force protection from sub-surface, surface and airborne threats and a sustainable logistic reach, allowing a persistent presence at the range.
- A hallmark of a true blue-water navy is the ability to conduct a replenishment at sea (RAS), i.e. transfer of fuel and ammunition underwater and the commissioning of underway replenishment ships is a definite sign of a navy’s blue-water ambitions.
- These are some of the attributes to be maintained by the country to be called as a blue water navy.

Indian Navy – the quest to be a blue water navy:

- Indian Navy has the designation of “leading power projection capability” in the region” and is, therefore, a blue water navy.
- India initially outlined its intentions of developing blue-water capabilities under the 2007 Maritime Capabilities Perspective Plan, with the navy’s priority being the projection of “power in India’s area of strategic interest”, the Indian Ocean Region.
- Since 2007 the navy has increased its presence in the Persian Gulf and the Horn of Africa to the Strait of Malacca, and routinely conducts anti-piracy operations and partnership building with other navies in the region.
- It also conducts routine two to three-month-long deployments in the South and East China seas as well as the western Mediterranean simultaneously. The navy has a listening post in Madagascar.
- All these power projection capabilities make Indian navy a blue water navy.

Significance of Blue Water Navy for India:

- While it is evident that Blue Water navies belong to the most powerful nations, there is no one internationally agreed upon definition.
- Owning one or more aircraft carriers is sometimes seen as a marker.
- The ability to undertake distant operations distinguishes a blue-water navy from a brown-water force. It requires strong integral capacity, including logistics, surveillance, networked operations, etc., and enabling capability, including equipment design, training, doctrine and organization.

- A blue-water navy is a maritime force capable of operating in the deep waters of the open oceans.
- The Most navies agree that a blue-water navy is capable of prolonged and sustained operations across the open oceans, and has a capacity to project “credible power” in the distant seas.

Challenges:

- The country has an aging naval fleet and replacement is often fraught with major delays. For instance, the INS Vikramaditya was delayed by five years, and an Indian Comptroller and Auditor General report criticized the navy’s operational readiness, given 74 percent of its refits between 2005 and 2010 were completed with a total delay of more than 23 years.
- The Indian Navy is currently weak on submarine capabilities. Most of India’s defense equipment is imported (mostly from Russia) and the country needs to develop its indigenous manufacturing capabilities.
- The navy’s allocation in the defense budget would force it to make crucial tradeoffs between developing one capability versus the other. Added to this is the strategic disconnect between the defense forces and the Ministry of Defense.
- Cost effective and timely modernization would be critical to fully realize India’s blue water dreams.
- India has the allocated funds, locational advantage, time and the opportunity to form strategic alliances on its side. But it needs to avoid getting this agenda mired in bureaucracy, inefficiency and a lack of strategic focus.
- And as acknowledged by its policy thinkers, India does have a window of opportunity to forge ahead on building its naval capabilities while China is still preoccupied with the Pacific Ocean.

Conclusion:

Just like the sea, naval maneuvers seem deceptively quiet for the most part, but in fact conceal deep underlying currents. The outcomes of India’s blue water quest will subtly but surely impact the region’s long-term strategic calculus.

MAINS 2020

GS-III

FEBRUARY 2020

Indian Economy and issues relating to planning, mobilization of resources, growth, development and employment.

The recent budget proposals with respect to the power and the renewable energy sector will not only help fulfill India's obligations towards global climate action but will also serve as an impetus to the economy. Elucidate. (250 words)

Reference: [The Hindu](#)

Why this question:

The article deals with important highlights of the Union Budget 2020-2021.

Key demand of the question:

The answer must discuss the significance of the recent budget proposals with respect to the power and the renewable energy sector.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly explain the key initiatives laid out in the budget with respect to the power sector and the renewable energy sector.

Body:

The Union Budget has allocated ₹22,000 crores to the power and renewable energy sector in 2020-21, aiming to improve the financial health of power distribution firms.

The proposals for prepaid smart metering and freedom to choose power suppliers will lay the ground to bring competition in the sector and give consumers a choice. This will increase the efficiency of the whole system.

The Budget provisions have given impetus to clean energy and power.

Discuss the provisions in detail.

Conclusion:

Conclude by reasserting the significance of such proposals to the power sector.

Introduction:

The provisions in Budget 2020 received a positive response from the power sector with the industry largely applauding the big push for renewables and rural economy through solar power and the emphasis on smart metering to ease out discom woes.

Recent budget proposals with respect to the power and the renewable energy sector:

1. 22, 000 crore proposed for power and renewable energy sector in 2020-21.
2. Expansion of national gas grid from the present 16200 km to 27000 km proposed.
3. Further reforms to facilitate transparent price discovery and ease of transactions.
4. India to provide ₹273 billion for promotion of industry and commerce
5. Firms operating old thermal power plants advised to shut units if emission norms not met
6. India to allocate ₹44 billion for clean air incentives in cities with over 1 million people
7. FY21 divestment target pegged at ₹2.1 lakh crore

The significance of the recent budget proposals with respect to the power and the renewable energy sector:

1. The Centre has proposed that discoms should replace conventional meters with smart pre-paid meters and give option to consumers to choose electricity suppliers.
2. State governments need to replace conventional electricity meters with pre-paid smart meters in three years
3. Natural gas pipeline grid will be expanded to 27,000 km from over 16,000 km now and further reforms for transparent price discovery for natural gas will be undertaken.
4. The government also underlined its ongoing efforts to provide clean energy through solar power and Ujjwala program that provides clean cooking fuel to households
5. Large solar capacity would be developed along the railway tracks on lands owned by the Indian Railways.
6. The budget has also provided incentives for states that are taking measures for cleaner air in big cities (with a population above one million). For this, ₹44 billion (~\$615 million) has been allocated in the budget.
7. To provide support to infrastructure projects, an investment clearance cell to be set up through a portal and will provide end-to-end facilitation, support, pre-investment advisory, information on land banks and facilitate the center and state approvals.
8. The government will also create a single investment cell to expedite the grant of licenses to promote entrepreneurship.
9. On India's plan for expanding electric mobility, that customs duty rates are being revised on electric vehicles.

Budget provisions have given impetus to clean energy and power:

1. To bring new energy companies under the lower corporate tax rate is expected to encourage investments. "Similarly measures to strengthen the Contract Act to improve financial condition of distribution companies, allowing farmers to utilize their land for renewable energy generation and an increased outlay for clean air in cities will provide further impetus to clean energy,
2. The decision to extend concessional corporate tax rate of 15 per cent to new power generating companies will give a major boost to the renewable sector.
3. The focus on ensuring smart metering replacing conventional energy meters by prepaid smart meters in the states and UTs over the next 3 years will prove to be a positive step in addressing the financial stress of DISCOMs, if there is 100 per cent compliance,
4. The budget provides a boost to propel domestic consumption through income tax sops for nearly 30 million income taxpayers and through improved financial health of 120 million marginal farmers.
5. The focus on gas and renewable energy will enable a shift towards clean energy and also deliver on commitments under the Paris Climate Agreement.

6. According to rating agency ICRA the measures to boost decentralised solar generation, including through solar pumps, is likely to lower subsidy dependence for discoms and also provide demand boost to solar equipment and energy efficient pump manufacturers.
7. The proposal to boost coverage of prepaid smart meters over the next three-year period is expected to aid discoms in curtailing distribution losses; benefit consumers by providing flexibility to choose suppliers and rates; and provide demand boost to smart meter manufacturers,”
8. The abolition of dividend distribution tax and lower tax rates will encourage fresh investments in the power sector, especially renewable energy and transmission sectors.

The implications these announcements might have on the future of the sector:

1. KPMG’s report suggests that the increased budgetary allocation for MNRE will improve financial assistance for various clean energy initiatives such as solar parks, roof-top solar, off-grid renewable energy, etc.
2. The Rs 1000 crore budget allocated for furthering the PM-KUSUM scheme can also have a major effect on the sector. The report states: ***“This kind of significant monetary allocation will help speed up implementation and could potentially result in 10-15 GW of new capacity creation if it materializes.*”**
3. This will be a big push for farmer’s income, but will in turn require lesser demand for grid scale power, targets for which then should be adjusted downwards.”
4. Additionally, the report also suggests that banks will have to provide funding at an effective cost of interest to aid the implementation of renewable energy projects and the commission will have to consider for feed-in tariff after taking into account the cost of debt.
5. Lastly, the proposal to set up large solar capacity alongside railway tracks can help the Railways add about 18-20 GW capacity by utilizing vacant land owned by the Indian Railways and reduce their power procurement cost.

Conclusion:

The above mentioned initiatives will act as a propellant to push forward the solar energy segment and will also promote development of clean energy in our country as well as provide employment opportunities within the country. These steps would bring significant benefits to the economy as well as consumers.

India’s major power generator NTPC Ltd has raised ‘largest ever’ Samurai loan recently. In the light of this statement explain what is a Samurai loan? and where will the funds raised under it be used? (250 words)

Reference: [Indian Express](https://www.indianexpress.com/article/business/india-nptc-ltd-raises-750-million-term-loan-in-japanese-yen-6481111/)

Why this question:

India’s largest power generator NTPC Ltd has raised a \$750 million-worth term loan in Japanese yen, claiming it to be the “largest ever” Samurai loan raised by any Asian corporate. Thus the question.

Key demand of the question:

The answer must discuss the concept of Samurai loans and their significance.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly explain what Samurai Loans are – Samurai loans allow non-Japanese firms to tap into the investment capital available in Japan and borrow funds in yen, which is among the currencies with the lowest interest rates.

Body:

Discuss in detail the concept – The cross border syndicated loan provides the borrower with capital to either enter the Japanese market or the ability to convert the proceeds into

The firm's local currency for use in existing operations.

The loan was raised under the automatic route of RBI's External Commercial Borrowing regulations and has been fully underwritten by the State Bank of India in Tokyo, Sumimoto Mitsui Banking Corporation in Singapore and Bank of India, Tokyo.

The facility has a door-to-door maturity of 11 years — the period within which the amount would have to be paid back — under two tranches.

Conclusion:

Conclude by reasserting the significance of such tools.

Introduction

India's largest power generator NTPC Ltd Monday said that it has raised a \$750 million-worth term loan in Japanese yen, claiming it to be the "largest ever" Samurai loan raised by any Asian corporate. The funds raised would be used towards implementing systems that would help the state-owned power giant bring about a "substantial" reduction in toxic Sulphur oxide emissions.

Body:

Samurai loans are Yen-denominated Cross Border Syndicated Loan for non-Japanese borrowers.

Their **features** include

- Relatively low pricing (low interest) due to ample liquidity of Japanese investors and,
- Their willingness to consider lending to unrated and/or unlisted borrowers from overseas.
- Borrower is free to either enter the Japanese market or the ability to convert the proceeds into the firm's local currency for use in existing operations.

Samurai Loans and India

Indian borrowers have raised a record US\$2.21bn via 10 Samurai loans in 2019, eclipsing the US\$1.6bn raised in 2018 from five deals, according to Refinitiv LPC data.

Examples

- **NTPC** : In an endeavor towards sustainable and cleaner environment, NTPC would utilize these loan proceeds to fund capex for installation of Flue Gas Desulphurization (FGD).
- **Telecom** : Reliance Jio has raised 53.5 billion Japanese yen (approximately Rs 3,251 crore) in Samurai loans.
- **RECL** had raised a bilateral five-year yen loan equivalent to \$92.5 million from Mitsubishi UFJ Financial Group Inc. and swapped it into rupees.

Significance of Samurai Loans

- Dollar lender are turning cautious amid impending interest-rate hikes in the US.
- **Easy availability**: Indian companies lured by Japan's near-record **low interest rates** and easier availability of funds.

- **Cheaper Loans:** Raising yen and swapping the funds to rupees was about 10 basis points cheaper than swapping from dollars to the Indian currency.
- **Lesser Risk :** Risks associated with raising capital in Japanese yen can often be mitigated with cross-currency swaps and currency forwards.
- Tapping and gaining exposure to Japanese markets and investors.

Conclusion

While Japanese capital is available, it is also discerning. Hence companies need to create robust business models, stable cash flow profiles and corporate governance standards that will satisfy Japanese investors. Over the next two decades, as India looks to create world class infrastructure, structures such as Samurai loans will be needed. As the infrastructure sector gradually recovers, capital structure innovation through channeling Japanese capital into attractive investment opportunities in the years to come will be a must.

The informal sector provides the vast majority of opportunities both for its youth and for people coming off the farm to earn incomes. In this context, what necessitates the reorientation of policies towards the informal sector? (250 words)

Reference : [The Hindu](#)

Introduction

The Periodic Labour Force Survey (PLFS) of the National Sample Survey Office (NSSO) released in 2019 showed the unemployment rate in the country in FY18 was at 5.3% in rural India and 7.8% in urban India, resulting in overall unemployment rate of 6.1%.

In India, which currently faces an unemployment problem, the informal sector provides the vast majority of opportunities both for its youth and for people coming off the farm to earn incomes. Hence, India's policymakers need to look at the demerits of formalisation from the perspective of informal sector enterprises.

Body

Importance of informal sector and its role

- According to ILO India Labour Market Update (2016) and NSSO data (2011-12), more than 90 percent of the employment in the agricultural sector and close to 70 percent in the non-agricultural sector falls under the informal category.
- Clearly, the informal sector is not the residual sector of the economy. In reality, it is the dominant sector
- The informal sector may not contribute much to the national income but its dominance in employment is likely to continue for some more time.
- Even while the organized sector has lagged behind, the informal sector has shown improvement in productivity, real wages, employment and capital accumulation.
- Empirical data underlines the fact that the informal sector has done better than its formal counterparts on economic parameters such as investment, job creation and accumulation of fixed assets, among others
- At present, only 10% of India's over 470 million workforces is in the formal sector. In other words, 90% of India's workers do not have the privileges—like social security and workplace benefits—enjoyed by their counterparts who are formally employed.

Necessity to reorient policies towards informal sector

- **Transition to Developed phase** : The development of an economy, from agriculture to the production of more complex products in industry, is a process of learning. Informal enterprises provide the transition space for people who have insufficient skills and assets to join the formal sector.
- **Inclusive development** : Merely making it easy for MNCs and large companies to invest will not increase growth of the economy if enterprises and incomes at the bottom of the pyramid do not grow.
- **Increasing formalization is also detrimental** : Voices of tiny entrepreneurs in the rural heartlands and on the fringes of Indian cities must be listened to while developing policies for 'ease of doing business'.
 - **Low wages** lead to a **low savings rate**, which is detrimental for the **credit cycle** and further lending, hampering development.
 - Informal sector workers usually lack **financial literacy**, depriving them of access to **institutional credit**, thus reducing domestic consumption and harming development.
 - Productivity of the economy decreases as a whole since companies lose the incentive to skill the employees, so that they can better reorient themselves to the demands of the economy.
- **Skill Development and training** : Government must speed up the process of learning within informal enterprises by developing their 'soft' skills. Large schemes to provide enterprises with hard resources such as money and buildings, which the government finds easier to organize, are necessary but inadequate for the growth of small enterprises.
- **Push factor** : Networks and clusters of small enterprises must be strengthened. They improve the efficiency of small firms by enabling sharing of resources; they give them more clout to improve the terms of trade in their favour within supply chains; and they reduce the 'last mile costs' for agencies and providers of finance and other inputs to reach scattered and tiny enterprises.
- **Labour reforms**: Social security architecture to be provided by the government for informal sector workers. Health insurance and availability of health services must be improved, and disability benefits and old-age pensions must be enhanced.

Conclusion

What the informal sector needs is less of regulation and more of support as against the government policy of more regulation and no support. It is time to use the opportunity that the informal sector provides to strengthen and support it. This is not only essential for economic growth but the only way for growth with jobs.

Do you agree that India needs to have an open mind on trade in an economically interconnected and technologically inseparable world? Comment and suggest measures to be taken in this aspect. (250 words)

Reference: [The Hindu](#)

Why this question:

The article is in the backdrop of the recent India's international trade posture that has appeared to turn protectionist in the past week.

Key demand of the question:

The answer must discuss the need for India to have an open mind on trade in an economically interconnected and technologically inseparable world. And suggest what Indian policy makers should do to achieve the same.

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

Briefly explain the context of the question.

Body:

Explain the nature of present globalization and technological advancements in the world. Present your opinion if India should open its doors in discussing Free Trade Agreements or remain cautious about its domestic manufacturers. Discuss the probable consequences of such a move. Suggest suitable measures to be taken in this regard.

Conclusion:

Conclude with way ahead.

Introduction:

India has recently sent out two indications which reflects, it turning inward and becoming protectionist. The first indicator was that laying out the Budget for the year, the finance minister made several references to the problems with free trade and preferential trade agreements (FTAs and PTAs). The other indicator was that India declined to attend a meeting of trade negotiators in Bali that was discussing the next step in the Association of Southeast Asian Nations (ASEAN)-led Regional Comprehensive Economic Partnership (RCEP) trade agreement.

Body:

Yes, India needs an open mind on trade because:

- India's absence in the Bali meeting, it has sent a clear signal that it does not want to engage on the multilateral front but deal with countries bilaterally.
- But for other countries, since they are part of multilateral grouping, any bilateral meeting with India could take place only after the multilateral process is completed. This also means that the other countries may not offer anything substantial on the bilateral level to India as they would be bound by multilateral RCEP agreement.
- India and Australia began Comprehensive Economic Cooperation Agreement (CECA) talks in 2011 but negotiations since then has not reached any consensus.
- India-United Kingdom have initiated the FTA talks too. However, it is unlikely that the U.K. will actually be able to proceed with a dialog until U.K.'s full withdrawal from the European Union (EU) is completed.
- India's talks with the EU for a Bilateral Trade and Investment Agreement (BTIA) is unlikely to make much headway.
- The motive may be to protect Indian markets from dumping but the consequence of the changes will put Indian importers on notice and discourage imports in general.

Need for India to reconsider its decision:

- The government has invoked the massive \$57-billion trade deficit with China to explain protectionist measures, but it forgets its own trade surpluses with smaller economies, particularly in the neighbourhood, where Indian exports form more than 80% of total trade with Nepal, Bangladesh, Bhutan and Sri Lanka, respectively.
- With the door to RCEP all but closed, and the South Asian Association for Regional Cooperation (SAARC) virtually abandoned, India is not a part of any regional FTA.
- The trend across the world does not favor trade in services the way it does in goods, as most countries have turned migration-averse.
- India's strength in the services sector and its demand for more mobility for Indian employees, is thus becoming another sticky point in FTA negotiations.
- The debate over trade is as much about India's leadership ambitions in the world, and the factors that could inhibit its rise. It would be hard to argue that India can rise in Asia without closer trade links with the East or the backing of South Asia.

Measures needed:

- It is necessary to have open mind in handling trade relations, calculative cost benefit analysis is equally important.
- The technological interventions, military & space intelligence sharing between nations is equally crucial for India to become well equipped & developed. Hence, FTA & regional Trade pacts are highly essential in handling relations.
- FDI from developed nations will be possible when trade relation will be effective. It will impact the future of investment for India.
- Review of the previously signed FTA's with countries like Japan and South Korea.
- Encouraging domestic markets to be more competitive.

Conclusion:

India's demographic might is certainly attractive for international investors, but only if that vast market has purchasing power and is not riven by social unrest and instability. Therefore, in this modern, economically interconnected and technologically inseparable world, India should have an open mind on trade.

Discuss the advantages of disinvestment as a mode for mobilization of resources for the government with recent cases. (250 words)

Reference: [The Hindu](#)

Why this question:

Union Minister of Finance recently announced that the government plans to sell a part of its holding in Life Insurance Corporation (LIC) by way of an Initial Public Offering (IPO). Thus the question.

Key demand of the question:

The answer must discuss the advantages of disinvestment as a mode for mobilization of resources for the government with recent cases.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain the aspects of disinvestment in general for an economy.

Body:

Disinvestment is the action of an organization or government selling or liquidating an asset or subsidiary. Disinvestment also refers to capital expenditure reductions, which can facilitate the re-allocation of resources to more productive areas within an organization or government-funded project. It is also known as divestiture; it is the opposite of an investment and is usually done when that subsidiary asset or division is not performing up to expectations. Discuss the types of disinvestments. Explain the advantages while highlighting the concerns involved.

Conclusion:

Conclude by reasserting the significance of such measures to the economy.

Introduction:

Disinvestment, or divestment, refers to the act of a business or government selling or liquidating an asset or subsidiary or the process of dilution of a government's stake in a Public Sector Undertaking (PSU). In the most recent developments, the government in the Union Budget proposed to sell a part of its holding in Life Insurance Corporation (LIC) by way of an initial public offering (IPO).

Body:

Advantages of disinvestment as a mode for mobilization of resources for the government:

- Some believe that “the government has no business being in business”.
- The government's role is to facilitate a healthy business environment
- To earn additional income from the proceeds of a stake sale.
- The government has to spend higher amounts on infrastructure to boost economic growth, along with its commitments on health and education.
- India is currently facing an economic slowdown in which indirect tax collections are below par.
- The government has cut corporate tax rates. As a result of cut and to-be-cut tax rates, the government would have less and less cash for its own expenditure in infrastructure and the social sector.
- Disinvestment proceeds will be critical for the government to stick to its Fiscal Deficit target.
- If the fiscal deficit goes out of hand, global rating agencies lower the country's investment grade.
- This would make any future foreign currency loans costlier.
- Here is where proceeds from strategic sales give the government extra spending cushion.
- Improving the structure of incentives and accountability of PSUs in India.
- Brings about greater efficiencies for the economy and markets as a whole.
- Bring relief to consumers by way of more choices and better quality of products and services, e.g. Telecom sector.

Way forward:

- Define the priority sectors for the government based on its strategic interests.
- Investment in PSU's has to be in terms of generation of adequate social and strategic returns.

- Financial return cannot be the sole reason for investment in PSUs. They have to serve social/strategic purposes. The key role of a PSU is to maintain competition in the sector and limit excessive monopoly.
- Government ownership is required for sectors with strategic relevance such as defence, natural resources, etc. The government should, therefore, exit non-strategic sectors such as hotels, soaps, airlines, travel agencies and the manufacture and sale of alcohol.
- The outlook towards strategic divestment should move from the current policy of emphasizing on public ownership and retaining majority shareholding to looking at the strategic interest.
- It is important to realize that ownership is not a substitute for regulation.
- Therefore, instead of creating PSUs in non-priority sectors, the government should look into strengthening the regulatory framework that ensures efficient market conditions. The regulations should also ensure that the basic necessities of the consumers are met.

Account for the role that microfinance institutions can play in poverty alleviation in India. (250 words)

Reference: Economic Survey 2019-20 – Chapter 7

Why this question:

The question is based on the analysis provided by the recently released economic survey upon the role that microfinance institutions can play in poverty alleviation in India

Key demand of the question:

The answer must discuss the role that microfinance institutions can play in poverty alleviation in India

Directive:

Account – Weigh up to what extent something is true. Persuade the reader of your argument by citing relevant research but also remember to point out any flaws and counter-arguments as well. Conclude by stating clearly how far you are in agreement with the original proposition.

Structure of the answer:

Introduction:

Briefly explain what Microfinance institutions are.

Body:

Explain the importance of microfinance institutions in poverty alleviation.

Microfinance services help the poor to lift out poverty, provide them self-employment and empower the women. In this way, microfinance services made poor people start their own business through they can increase income and be bankable which contribute the overall economic growth and poverty reduction.

Discuss about the future prospects these institutions have in India.

Suggest suitable measures to be taken in this regard.

Conclusion:

Conclude by suggesting way forward.

Introduction:

Microfinancing is the delivery of financial services to poor and low income households with limited access to formal financial institutions. It can also be described as banking for the underprivileged. Microfinance institutions (MFIs) came into being in the 90s as banks' reluctance to lend to those without credit history provided an opportunity to those willing to take risk and organize rural communities. According to **Mohammed Yunus** (founder of Grameen Bank in Bangladesh) **access to credit was a human right, essential for the poor to create self-employment and income.**

Body:

Role played by MFIs:

1. The two key systems for the release of financial services to such customers include 'relationship-based banking' for individual entrepreneurs and small businesses along with 'group-based models' where several entrepreneurs come together to apply for loans and other services as a group
2. Be a viable financial institution developing sustainable communities.
3. Mobilize resources to provide financial and support services to the poor, particularly women, for viable productive income generation enterprises enabling them to reduce their poverty.
4. Learn and evaluate what helps people to move out of poverty faster.
5. Create opportunities for self-employment for the underprivileged.
6. Train rural poor in simple skills and enable them to utilize the available resources and contribute to employment and income generation in rural areas.

Benefits from MFIs:

1. **It allows people to provide for their families.** Through microfinance, more households are able to expand their current opportunities so that more income accumulation may occur.
2. **It gives people access to credit.** "By extending microfinance opportunities, people have access to small amounts of credit, which can then stop poverty at a rapid pace,"
3. **It serves those who are often overlooked in society.** About 95 percent of some loan products extended by microfinance institutions are given to women, as well as those with disabilities, those who are unemployed, and even those who simply beg to meet their basic needs.
4. **It creates the possibility of future investments.** Microfinance disrupts the cycle of poverty by making more money available.
5. **It can create jobs.** Microfinance is also able to let entrepreneurs in impoverished communities and developing countries create new employment opportunities for others.
6. **It encourages people to save.** "When people have their basic needs met, the natural inclination is for them to save the leftover earnings for a future emergency,"

However, off-late the main goals of MFIs are deviated:

1. MFIs have strayed away from their original purpose of poverty alleviation and social empowerment to short-term profit-making.
2. Many have begun to replicate the behaviour of mainstream financial institutions, setting financial targets which loan officers are under tremendous pressure to deliver.
3. MFIs are harassing their clients who are usually too desperate to turn away from the credit being offered. This is true even when credit comes with the catch of high repayment rates.
4. Several large MFIs that transformed into small finance banks (SFBs) are looking to diversify into inclusion adjacencies such as micro, small and medium enterprise loans and affordable housing loans.
5. The demand potential in these segments also remains buoyant over the medium term given the untapped potential.

Way forward:

1. There is a need for MFIs to consider adopting more flexible operating models, providing skills training and offering services such as portability of accounts to provide greater access for a longer duration of time.
2. A diversified menu of micro loan products linked to sustainable income generation activities via micro enterprises or a creation of community-based pooled enterprise could possibly make it more attractive and compatible with the requirements of women.
3. In addition, linking such developmental initiatives to an institution to nurture, monitor and handhold those activities in the formative stages is crucial for sustainability.

Conclusion:

As per the World Bank estimates, more than 500 million people have improved their economic conditions via microfinance-related entities. Strengthening the credit check and debt collection processes and educating the villagers about products and consequences is important. A model to retain and recycle within the target population could possibly lead to a sustained route for poverty alleviation.

Discuss the effect of global price movements on food inflation in India. (250 words)

Reference: [Indian Express](#)

Why this question:

The article brings out the fact that Retail and wholesale food inflation rates for December 2019 were the highest since November 2013 and December 2013 respectively, and then provide a detailed analysis of factors affecting the food inflation in the country.

Key demand of the question:

Discuss in detail the effect of global price movements on food inflation in India with suitable justifications.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain the prevailing conditions of food inflation in the country.

Body:

Quote statistics/facts suggesting food inflation in the country. Discuss the major factors responsible for it – local and global factors with greater emphasis on the latter. Quote and discuss the global factors such as – Coronavirus, global crude prices etc. Discuss the possible uncertainty in the trend and measures to address and mitigate it.

Conclusion:

Conclude with solutions for both long term and short term to overcome the persistent food inflation.

Introduction:

The United Nations Food and Agriculture Organization's (FAO's) food price index — which is a measure of the change in international prices of a basket of major food commodities with reference to a base period (2002-04 = 100) — touched 182.5 points in January 2020, the highest since the 185.8 level of December 2014. This sharp surge in global food prices is reflected in trends in India as

well. Annual consumer food price index (CFPI) inflation stood at just 2.99% in August 2019, before climbing to 5.11%, 7.89%, 10.01%, 14.19% and 13.63% in the succeeding five months.

Body:

Factors leading to food inflation in India:

1. While the recent rise in domestic food prices has been blamed largely on “local” factors — poor rainfall during the first half (June-July) of the monsoon season and too much of it thereafter till about mid-November.
2. This lead to both reduced/delayed kharif sowings and damage to the standing crop at maturity/harvesting stage — some of it is also “imported”.
3. On the other hand, the increase in the retail prices of onion in Delhi from Rest 22 per kg on January 31, 2019 to Rs 50 on January 31, 2020, was purely due to the failure of the domestic kharif crop.
4. While global prices can be transmitted to the domestic market too through exports — traders would sell abroad if realisations are better relative to the local market — the government has foreclosed that possibility by banning/restricting onion shipments since September 2019.

Possible Effects:

- the novel coronavirus epidemic that has reduced Chinese buying of everything from palm oil and soyabean to milk powder and meat.
- Palm oil prices in Malaysia have plunged from 2,922 ringgit (\$719) to 2,725 ringgit (\$658) over the last one month.
- Crude Oil: Brent crude prices had touched \$70 per barrel after the January 3 United States airstrike that killed Iran’s top military commander, but have dropped since, closing at \$57.67/barrel on Tuesday.
- The prospect of a bumper rabi (winter-spring) crop in India. The kharif harvest turned out to be not so good because of excess and unseasonal rain. That same rain, though, has helped boost rabi acreage by 9.5% compared to last year.
- The arrival of this crop in the mandis from March should cool down prices, especially of vegetables and pulses, which showed the highest year-on-year retail inflation of 50.19% and 16.71% in January.

- Global palm oil ending stocks this year are projected to be the lowest since 2009-10, while sugar is also expected to move significantly into deficit.
- Supply tightness is being seen both globally and in India, even in milk.

Measures needed:

- Storage capacities and infrastructure should be increased.
- Develop the agricultural facility with good agricultural practice which leads to the transition from staple food crops to diversification of crops.
- Backward linkages to farmers need to be made more robust. Contract farming can be promoted. According to the **Model Contract Farming Act, 2018**, the contract will specify the quantity, quality and price of produce being supplied. This would shield farmers from price volatility, subject to quality commitments.
- Government should accelerate technology dissemination, especially relating to environmental sustainability, climate change, crop yields and mechanisation. This will reduce dependence on costly inputs, labour and chemicals, and stimulate food supply.
- **Info supply chain:** The government should invest in a market information system for accurate and timely data of crop production, trade and prices. This will send right price signals from consumers to the supply chain, improve bargaining power and reduce business risk and response time.
- **Real competition:** Government should end rent-seeking in the food supply chain by encouraging competition through efficient markets. Removing barriers such as mandi licences and state taxation laws will puncture marketing margins. Consumers rarely benefit from any crop price fall because of the marketing margin commanded by the biggest players.
- **Calm volatility:** Government should encourage strengthening of the supply pipeline by the private sector to reduce price volatility. There is an inverse relationship between stocks in the pipeline and prices. Smaller the stocks lying in godowns, higher the prices shoot.
- Instead of treating stockists as criminals under the Essential Commodities Act (ESA), a transparent online mechanism to track commodities lying in warehouses should be introduced.
- The government should stop market interventions in its zeal to balance consumer and farmer interests.
- Rising food prices are the outcome of farm costs, business risk premium and market concentration. We can lower all three through a smarter mix of technology, institutions and policies.

Research and Development (R&D) plays a critical role in determining the productivity and economic growth of a nation, Discuss the relevance of harnessing private sector investments to improve the spendings on R and D in the country.(250 words)

Reference: [The Hindu](#)

Why this question:

In an effort to stimulate investment in research and development (R&D), the Department of Science and Technology is mooted a fund that will match the contributions made by private companies in R&D. Thus the context of the question.

Key demand of the question:

The answer must discuss the significance and relevance of harnessing private sector investments to improve the spendings on R&D.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Explain the Research and Development investments scenario in India.

Body:

Highlight the present situation of low expenditures in the R&D sector. Substantiate with suitable facts such as – The total expenditure on R&D in India has tripled in the last decade in nominal terms. However, as a fraction of GDP, public expenditures on R&D have been stagnant over the years. It is between 0.6-0.7 percent of GDP over the past two decades. Discuss the public sector dominance in the sector. Explain what is the present idea of harnessing the private sector investments for betterment of the R&D sector.

Conclusion:

Conclude with benefits of such policies and assert the significance of R&D for the growth and development of the country.

Introduction:

According to Economic survey 2017-18, India's spending on R&D in terms of percentage of GDP has been stagnant at 0.6 to 0.7 per cent in the last two decades — much lower than the US, China, South Korea and Israel. Private investments in R&D have severely lagged public investments in India, it said. In most countries, the private sector carries out most of the R&D. However, in India, the government is not just the primary source of R&D funding but also a primary user of these funds.

Body:

Relevance of harnessing private sector investments to improve the spendings on R&D in the country:

- Key drivers of economic performance and social well-being
- It is important to inculcate scientific temper among masses in order to fight superstitions, distorted truth and religious fanaticism that has been crippling India
- Innovation and technological improvement has become essential to combat and adapt to climate change and promote sustainable development,
- It is imperative for combating national security threats ranging from cyber ware to autonomous military systems such as drones.

- Investing in research and providing adequate incentives leads to creation of jobs, especially for the pool of engineers and researchers in the society.
- Under the 'Make in India' program, the government has targeted to create 100 million jobs from the manufacturing sector by 2022.

Measures needed:

- The private sector should be incentivised to undertake and support R&D through CSR (Corporate Social Responsibility) funds.
- State governments should also invest in application-oriented research aimed at problems specific to their economies and populations.
- There is a need to encourage investor-led research. In this direction, the Science and Engineering Research Board (SERB) has already been established. It is a promising start that needs to expand with more resources and creative governance structures.
- R & D should focus on technology and extension services that is directly related to common people
- Engage private sector, state government and Indian Diaspora

Conclusion:

Investing in educating youth in science and mathematics, reform the way R&D is conducted, engage the private sector and the Indian diaspora, and take a more mission-driven approach is the need of the hour in India. Vigorous efforts to improve the "ease of doing business" need to be matched by similar ones to boost the "ease of doing science."

Discuss the Economic effects of the coronavirus on the Indian economy. (250 words)

Reference: [The Hindu](#)

Why this question:

From mobile phones, toys, pharmaceuticals to kitchen goods, traders in several sectors here say that the slowdown in trade activity with China, as a consequence of COVID-19, will soon start to effect business.

Key demand of the question:

The answer must discuss the dependence of China on India and thus the implacable possibilities of the corona outbreak.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly highlight the dependence of Indian economy on China.

Body:

Highlight the majority dependence of China; import of finished goods for re-distribution, raw material for production purposes and the import of spare parts used in assembling goods. Discuss what can be the possible effect of Corona outbreak? Explain what India should do in such a situation.

Conclusion:

Conclude that it's a lesson for India to reduce heavy dependencies on a single country and diversify its imports and as well focus on domestic markets.

Introduction:

The coronavirus outbreak has brought a large part of the world's second-largest economy China to a standstill and its impact has been felt across industries. On January 30, the World Health Organization (WHO) declared the coronavirus (COVID-19) outbreak a global health emergency. The impact on India is felt through supply chain disruptions from China as well as regional players, who in turn are net importers from China.

Body:

India's Imports from China

Note: China including Hong Kong
Chart: Dipu Rai - Source: Interecon

Indian exports to China

Note: China including Hong Kong
Chart: Dipu Rai - Source: Interecon

Economic effects of the coronavirus on the Indian Economy:

- The impact on India is felt through supply chain disruptions from China as well as regional players, who in turn are net importers from China.
- India's annual trade with China is ~\$90 billion—India imports goods worth \$75 billion and exports goods worth \$15 billion.
- These include **'electrical and telecom machinery,' 'organic chemicals,' 'nuclear reactors,' 'plastics' and 'pharmaceuticals.'** The first four of these five groups also make up India's top imports in 2019 fiscal year.
- On account of factory closures in China, supply chains would get disrupted and this could result in shortages, especially of electronic goods and medicines.
- A key supplier of **generic drugs** to the global market, Indian companies procure almost 70 percent of their **active pharmaceutical ingredients** for their medicines from China.
- Trade deficit prints may be lower for the next couple of months. We may see the price of consumer durables inch higher. This would drive core inflation higher, which is showing signs of bottoming out.
- This, in turn, could make it more difficult for the MPC to provide further monetary policy stimulus. January's core inflation print came in at 4.2 percent compared to December's 3.8 percent.

- Fall in global crude prices on account of an anticipated slowdown in demand would also result in a lower import bill. The sectors that are likely to be impacted on the export front are diamonds, leather and petrochemicals
- Imports are likely to contract more than exports and therefore, from a current account perspective, the outbreak could actually be rupee-supportive.
- **Offshore fundraising by Indian corporates** is also likely to slow down, as raising money onshore has become cheaper after the LTRO announcement by the RBI
- **The retail mobile trade**, for instance, is almost entirely dependent upon China. While every month, old models of mobile phones would see a drop in prices as new models are supplied, in the current month, no such drop in prices has taken place and the supply of goods is being rationed by companies
- **The toy market** sees nearly 80% of its demand met by products made in China, while only 20% is met by Indian manufacturers
- Many items, like belt buckles, Christmas lights, specific parts of gas stoves, are only made in China. The prices of most of these goods had already seen an upward correction, and in some cases it is as much as 50%
- **The travel and tourism sector** will be affected badly. Several overseas airlines have stopped flights to China and international hotel chains have also been offering refunds. Most of the Chinese citizens are avid travellers, hence the tourism in other countries might feel the ripple effect.

Way forward:

1. India and the other countries should be prepared to face the effects both in terms of the spread of the virus and in dealing with the economic slowdown which can occur.
2. RBI Governor has said that the Reserve Bank of India is reviewing the retail inflation targeting framework behind monetary policy decision as well as its effectiveness and also plans to hold stakeholders' consultations including with the government in June.

Conclusion:

Nevertheless, India's chief economic advisor and other analysts have pointed to the opportunity for India to expand its exports as a result of the crisis. Helped by foreign investment, India has "slightly" reduced its dependence on China over the past five years, although complexities in its manufacturing system make it difficult for Asia's third-largest economy to quickly take advantage.

Inclusive growth and issues arising from it.

What are the challenges for inclusive growth in India? Suggest measures to be taken to address these challenges. (250 words)

Reference: [EPW](#)

Why this question:

At the question is straightforward and aims to ascertain the challenges facing the inclusive growth in India.

Key demand of the question:

The answer must discuss the importance of inclusive growth and the need to address the challenges facing it. And suggest measures to overcome such concerns.

Structure of the answer:

Introduction:

Briefly explain what you understand by Inclusive growth.

Body:

Inclusive growth has remained elusive despite government's best efforts. Post-1991 India has witnessed a rise not only in prosperity but also disparities. Inequalities have got widened and accelerated. Well developed and prosperous regions have attracted most of foreign investment and have grown further rapidly. Explain what the major challenges for inclusive growth are:

Poverty, lack of adequate employment opportunities.

Lack of adequate education and skill development.

Lack of infrastructure – Social and physical.

Governance deficit, especially in backward regions. Etc.

Suggest measures and solutions to address these issues.

Conclusion:

Conclude that targeted policy measures addressing the above, with the efforts of government policies and programmes aiming at achieving targets in above key sectors can lead to inclusive growth.

Introduction:

The concept of **inclusive growth focuses on equitable growth for all sections of society**. This involves ensuring that fruits of growth and development reach the poor and marginalized sections as well. Inclusiveness is a multi-dimensional concept. Inequalities that include, social exclusion, discrimination, restrictions on migration, constraints on human development, lack of access to finance and insurance, corruption – are sources of inequality and limit the prospect for economic advancement among certain segments of the population, thereby perpetuating poverty.

Body:

Challenges to inclusive growth:

Poverty alleviation is one of the big challenges for India. Eradication of poverty in India is generally only considered to be a long-term goal. Poverty alleviation is expected to make better progress in the next 50 years than in the past, as a trickle-down effect of the growing middle class.

Increasing stress on education, reservation of seats in government jobs and the increasing empowerment of women and the economically weaker sections of society, are also expected to contribute to the alleviation of poverty

Government schemes should target eradication of both poverty and unemployment (which in recent decades has sent millions of poor and unskilled people into urban areas in search of livelihoods) attempt to solve the problem, by providing financial assistance for setting up businesses, skill honing, setting up public sector enterprises, reservations in governments, etc.

Disparity

1. The disparity between -> Rich and Poor
2. The disparity between -> Urban and Rural
3. The disparity between -> Educated and Uneducated

Demography: We have 550 million young people below 25 age, we have the ready workforce for the world, everything we do today must focus on this population, we need to provide them nutrition food, skills, and job opportunities to grow.

Improving the delivery of core public services: The incomes rise, citizens are demanding better delivery of core public services such as water and power supply, education, policing, sanitation, roads and public health. As physical access to services improves, issues of quality have become more central.

Maintaining rapid growth while making growth more inclusive: The growing disparities between urban and rural areas, prosperous and lagging states, skilled and low-skilled workers, the primary medium term policy challenge for India is not to raise growth from 8 to 10 percent but to sustain rapid growth while spreading its benefits more widely.

Developmental challenges:

Expansion: Expansion is happening every day in developing countries like India, but perhaps not happening in the pace we would like. We have roads but we need more roads likewise we need to expand energy, infrastructure, facilities, etc.

Excellence: Leaving of our top 5 or 10% quality of our education, our services, our governance, is really not that so great, we must collectively work towards improving quality in everywhere.

Equity: We need to make sure that the poorest to the poorer can indeed get the best education, health, jobs, and other facilities.

Social development is possible through achieving Women Empowerment and eradicating the regional disparities. Though the Government is giving the women empowerment by giving special reservations, the women's advancement in India is still not matched the expectations for inclusive growth.

Measures needed:

1. Lowering the incidence of poverty and inequality requires a comprehensive strategy.
2. Important steps need to be taken like framing policies to improve health, nutrition and education.
3. Labour market reforms and reforms of direct taxation will have redistributive effects on the system.

4. Schemes like National Rural Employment Guarantee Scheme (NREGS), provide 100 days or more of employment at a wage determined by government are already in progress but there is a need to check the cost effectiveness of these schemes
5. Reforms to plug the leakages in the PDS, introduction of GPS tracking, activating vigilance committees, must be undertaken across the country.
6. Research needs to be carried out by government agencies to document the 'best practices' in the implementation of government schemes.
7. Minorities and other excluded groups, including the poor in upper castes, also need special programmes to bring them into the mainstream.

Conclusion:

To achieve inclusiveness, all these dimensions need to be looked into. Institutional and attitudinal changes should be brought about though this will take time. Awareness about inclusiveness and empowerment is required to be created. Reducing poverty is to be taken as key element in our inclusive growth strategy and there has been some progress in that regard.

Effects of liberalization on the economy, changes in industrial policy and their effects on industrial growth.

Discuss the concept of what Share pledging; explain why it is an important tool in gauging a company's financial health. (250 words)

Reference: [The Hindu](#)

Why this question:

The Securities and Exchange Board of India (SEBI) has amended the SEBI (Depositories and Participants) Regulations by including an additional explanation that states that 'pledge' would also refer to 're-pledge of securities for margin or settlement obligations.'

Key demand of the question:

The answer must discuss about the move; benefits and significance; about share pledging.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define what is meant by Pledging of shares.

Body:

What is a pledged share? – Simply put, it is taking loan against the shares one holds. It can be done by both investors and promoters.

Why do promoters pledge shares? – One of the methods promoters use to raise finance is to take loans against their holding in their company from banks or non-banking financial companies. For these financial institutions, these shares are collateral. Promoters can raise funds for various reasons- for meeting requirements of the business or personal needs.

What are the risks involved for the retail investors? – explain.

Highlight the changes made recently; Onus of bonafide pledge created from margin account of a stock broker will now lie with the depository following the SEBI amendment.

Discuss how all this helps gauge the financial health of any company.

Conclusion:

Conclude with the likely benefits of the move.

Introduction:

Pledging of shares is one of the options that the promoters of companies use to secure loans to meet working capital requirement, personal needs and fund other ventures or acquisitions. A promoter shareholding in a company is used as collateral to avail a loan. While pledging shares, promoters retain their ownership.

The Securities and Exchange Board of India (SEBI) has amended the SEBI (Depositories and Participants) Regulations by including an additional explanation that states that 'pledge' would also refer to 're-pledge of securities for margin or settlement obligations.'

Body:

Share pledging – an important tool in gauging a Company's financial health:

1. Promoters pledging their personal holdings with lenders should not affect the operations of a company which has good cash flows or sound fundamentals.
2. But companies with a high proportion of promoter pledging are viewed as risky by the market because it raises questions about promoters being cash-strapped in their personal capacity or facing debt problems in other group ventures.
3. In a bull market, promoter pledging may not create too many issues as higher stock prices boost the value of the collateral against the loans advanced by lenders.
4. But in bear markets, steep stock price declines can trigger margin calls that set off a downward spiral in a stock.
5. Investors therefore need to keep a close eye on promoter pledging, as companies with high pledging can witness high volatility in their stock prices.
6. As an investor, you can find the information on pledged shares on the websites of the stock exchanges. SEBI has mandated that publicly listed companies need disclose information on their pledged shares along with the shareholding pattern every quarter to NSE and BSE.
7. In case promoters fail to make up for the difference, lenders can sell the shares in the open market to recover the money.
8. However, as the share price keeps fluctuating, the value of the collateral also changes.

Challenges:

1. Share pledging is a standard way of accessing funds for companies, but bitter experiences in the past have created a negative impression about the instrument, as it signals poor cash flow patterns, credit crunch in a company and promoters' inability to meet short-term working capital requirements.
2. Share pledge can be troublesome for companies at times, as promoters are required to maintain the value of the collateral all the time by providing additional shares to lenders when their value erodes.

3. This can lead to a reduction in the promoters' shareholding in the company, further value erosion in the stock due to infusion of additional paper in the market, and even sudden change of guard in the company because of alteration in shareholding pattern.
4. Promoters often make such share pledges for personal needs as well.

Conclusion:

Given that a large proportion of a promoter's wealth is likely to be held in the form of shares, share pledging agreements help entrepreneurs raise quick money when they need it.

Major crops cropping patterns in various parts of the country, different types of irrigation and irrigation systems storage, transport and marketing of agricultural produce and issues and related constraints; e-technology in the aid of farmers Discuss the prospects of transforming Indian Agriculture through farm Mechanization. Highlight the steps taken so far by the government of India in recent times in this direction. (250 words)

Reference: [PIB](#)

Why this question:

The article highlights the significance of transforming agriculture through farm mechanization.

Key demand of the question:

The answer must discuss the significance of farm mechanization applied to Indian context to transform the Indian agriculture scenario to the next level.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly highlight steps Indian Government has been taking to achieve Doubling of Farmer's Income by 2022 and emphasis on the aspects of farm mechanization.

Body:

Explain what you understand by farm mechanization.

Highlight the steps that have been taken by the government of India in this direction.

Discuss the significance of mechanization as applied to Indian setup of agriculture.

Indian Government appointed Ashok Dalwai Committee to recommend measures to achieve farm mechanization targets.

One of the most important recommendations of the committee is to fast track the mechanization of farm implements in all areas of the country as improved agricultural implements and machinery are essential inputs for modern agriculture.

Conclusion:

Conclude by highlighting schemes and policies being taken by the government in this direction.

Introduction:

Agriculture involves 65% of the population and out of this 55% are directly dependent for their livelihood. With huge population growth and land transfer it has led to the problem of fragmentation which has deteriorated the condition of land and has limited the scope for mechanization. Farm Mechanization deploys Machineries in Farming activities, has a potential to

transform Agri productivity & Farm Income & meeting the rising food demand challenges by boosting food security efforts.

Body:

Prospects of transforming Indian Agriculture through farm Mechanization:

1. It will lead to increased productivity in the yields, thereby leading to better remuneration and decreased distress migration and related problems.
2. Leads to increased land coverage
3. It would reduce the disguised unemployment.
4. Sprinkler and Drip irrigation can save huge water as well as prevent soil erosion.
5. Deep ploughing increases the soil fertility and it also help in controlling weeds also we make use of fallow land with the help of new machines.
6. Better transportation and supply chain management of agri-produce to reduce post-harvest loss.

Steps taken up by Government of India:

1. **Sub Mission on Agricultural Mechanization (SMAM):** a special dedicated scheme has been introduced by Government, under which subsidy is provided for purchase of various types of Agricultural implements and machinery used for tillage, sowing, planting, harvesting, reaping, threshing, plant protection, inter cultivation and residue management.
2. A special Scheme to support the efforts of the Governments of Haryana, Punjab, Uttar Pradesh and the NCT of Delhi to address air pollution due to stubble burning and to subsidize machinery for the farmers for in-situ management of crop residue.
3. a new Central Sector Scheme on “Promotion of Agricultural Mechanization for In-Situ Management of Crop Residue in the States of Punjab, Haryana, Uttar Pradesh and NCT of Delhi” (CRM) for the period from 2018-19 to 2019-20 has been also launched.
4. Some of the State Governments like Kerala, Tamil Nadu and Madhya Pradesh are providing farm machineries to the farmers at a concessional rate through their Agricultural Departments.
5. to make available costly and bigger advance farm machinery at the door steps of the farmers on rent basis, Government is promoting **Custom Hiring Centres (CHC)** through a SMAM scheme.
6. A special consideration for the farmers of North Eastern Region (NER) is available, 95% subsidy upto a project cost of Rs. 10 lakh is provided to group of NER farmers for establishment of Custom Hiring Centres.
7. The Government has also developed and launched **Multi lingual Mobile App “CHC- Farm Machinery”** which helps the farmers for getting rented farm machinery and implements through Custom Hiring Service Centers (CHC) in their area.
8. The Government has introduced the **Kisan Credit Card (KCC) Scheme**, which enables farmers to purchase agricultural inputs and draw cash to satisfy their agricultural and consumption needs.

9. With a view to ensure availability of agriculture credit at a reduced interest rate of 7% p.a. to the farmers, an interest subvention scheme for short term crop loans upto Rs.3.00 lakh is implemented.

Conclusion:

Improved agricultural implements and machinery are essential inputs for modern agriculture. It enhances productivity besides reducing human drudgery and cost of cultivation. It also helps in improving utilization efficiency of other inputs. Thus, Farm Mechanization is the need to ensure Farmers' welfare through increased farm incomes, improving their livelihoods, strengthening both food & income security & boosting govt ambitions to double farm income by 2022.

Discuss the current status of food grain production in India and associated challenges.
(250 words)

Reference: [The Hindu](#)

Why this question:

The Agriculture Ministry's second advance estimates were released recently, consequently forcing us to probe the current status of food grain production in India and associated challenges.

Key demand of the question:

The question is pretty much direct and aims to assess the current status of food grain production in India and challenges associated with it.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Start with the key highlights of the estimate.

Body:

Note the following facts and use them to provide for a brief analysis of the current scenario –

Total food grain production is projected to scale an all-time high of almost 292 million tonnes in 2019-20, propelled by record production of both rice and wheat.

Production of several crops, including rice and major pulses, was lower than targeted in the kharif or the monsoon season. However, the abundance of late monsoon rains resulted in cumulative rainfall that was 10% higher than the long-period average for the season. This helped farmers rake in rabi or winter harvests that were larger-than expected in almost all crops.

Thus, the estimate for total food grain output of 291.95 million tonnes is more than six million tonnes higher than the 285.21 million tonnes produced in 2018-19.

The Agriculture Ministry expects rice production to reach 117.47 million tonnes, slightly higher than the 116.48 million tonnes produced in 2019. Wheat, which is only grown in the rabi season, will see a major surge in production at 106.2 million tonnes in the current year, from the 103.6 million tonnes in 2018-19.

Discuss the challenges involved – Despite the government's drive to encourage millets and nutri-cereals, production failed to match targets this year.

Explain the story with Pulses, oil seeds, the sudden peak in sugarcane production etc.

Conclusion:

Conclude with what needs to be done for effective and efficient management of food grains in the country.

Introduction:

As per Second Advance Estimates for 2019-20, total foodgrain production in the country is estimated at record 291.95 million tonnes which is higher by 6.74 million tonnes than the production of

foodgrain of 285.21 million tonnes achieved during 2018-19. However, the production during 2019-20 is higher by 26.20 million tonnes than the previous five years' (2013-14 to 2017-18) average production of foodgrain, a release issued by the government said.

Body:**Reasons for increased food grain production in India:**

1. Production of several crops, including rice and major pulses, was lower than targeted in the kharif or the monsoon season.
2. However, the abundance of late monsoon rains resulted in cumulative rainfall that was 10% higher than the long-period average for the season.
3. This helped farmers rake in rabi or winter harvests that were larger-than-expected in almost all crops.
4. The Agriculture Ministry expects rice production to reach 117.47 million tonnes, slightly higher than the 116.48 million tonnes produced in the previous year.
5. Wheat, which is only grown in the rabi season, will see a major surge in production at 106.2 million tonnes in the current year, from the 103.6 million tonnes in 2018-19.
6. Thus, the estimate for total foodgrain output of 291.95 million tonnes is more than six million tonnes higher than the 285.21 million tonnes produced in 2018-19.

Associates challenges:

1. Despite the government's drive to encourage millets and nutri-cereals, production failed to match targets this year, with the estimate pegged at 45.24 million tonnes.
2. Pulses production was also estimated to come in lower-than targeted 23 million tonnes, although it was still higher than the previous year's harvest.
3. Most pulses are dry land crops, grown on land without irrigation and the delay in monsoons in many areas hit kharif harvests although rabi production improved.
4. Oil seeds production was estimated at almost 342 million tonnes, higher than last year but still lower than the target for this year.
5. Sugarcane is the only major crop where this year's estimated production of 3,538 million tonnes was significantly lower than last year's output of 4,054 million tonnes.
6. A glut in sugar production over the last few years had resulted in a crash in prices and an increase in payment arrears from sugar mills to cane farmers.

Measures needed to diversify the food grain production:

1. Revisit the MSP policy: Currently, MSPs are announced for 23 commodities, but effectively price support operates primarily in wheat and rice and that too in selected states. This creates highly skewed incentive structures in favour of wheat and rice. While country is short of pulses and oilseeds (edible oils), their prices often go below MSP without any effective price support.
2. HLC recommends that pulses and oilseeds deserve priority and Government must provide better price support operations for them, and dovetail their MSP policy with trade policy so that their landed costs are not below their MSP.

3. Negotiable warehouse receipt system should be taken up on priority and scaled up quickly. Under this system, farmers can deposit their produce to the registered warehouses, and get say 80 percent advance from banks against their produce valued at MSP.
4. They can sell later when they feel prices are good for them. This will bring back the private sector, reduce massively the costs of storage to the government, and be more compatible with a market economy.
5. Buffer Stocking Operations and Liquidation Policy: One of the key challenges for FCI has been to carry buffer stocks way in excess of buffer stocking norms. FCI have to work in tandem to liquidate stocks in Open Market Sale Scheme or in export markets, whenever stocks go beyond the buffer stock norms.

Issues related to direct and indirect farm subsidies and minimum support prices; Public Distribution System- objectives, functioning, limitations, revamping; issues of buffer stocks and food security; Technology missions; economics of animal-rearing.

In the recent times there has been uproar to review the open ended procurement policy, Discuss what the policy is about? And explain how does the government decide minimum support price for the farmers? (250 words)

Reference: [The Hindu](#)

Why this question:

As the debate surrounding the review of open-ended procurement policy has started gaining momentum, following a recommendation by the Commission for Agricultural Costs and Price (CACP) to the Centre government, several farmers and farmers' bodies in Punjab and Haryana have hinted that any move To stop or limit it would be opposed and resisted.

Key demand of the question:

The answer must discuss in detail the concept of open ended procurement policy and the concerns associated with it, also explain how the government decides upon the MSP.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly explain what open ended procurement policy is.

Body:

Under open-ended procurement policy, government agencies buy whatever quantity of wheat and rice is brought by farmers into the mandis (wholesale markets), within the stipulated time and which conforms to fixed quality Parameters for Central pool.

Then move onto explain the procedure of forming MSP; CACP submits its recommendations to the government in the form of Price Policy Reports every year, separately for five groups of commodities namely Kharif crops, Rabi crops, Sugarcane, Raw Jute and Copra.

Discuss the detailed procedure.

Explain the challenges involved and suggest solutions to it.

Conclusion:

Conclude with the need to have a balanced approach.

Introduction:

As the debate surrounding the review of open-ended procurement policy has started gaining momentum, following a recommendation by the Commission for Agricultural Costs and Price (CACP) to the Centre government, several farmers and farmers' bodies in Punjab and Haryana have hinted that any move to stop or limit it would be opposed and resisted.

Open ended procurement policy:

Under open-ended procurement policy, government agencies buy whatever quantity of wheat and rice is brought by farmers into the mandis (wholesale markets), within the stipulated time and which conforms to fixed quality Parameters for Central pool. The Central Government extends price support to wheat and paddy through FCI and State Agencies. Procurement at MSP is open ended i.e., whatever foodgrains are offered by the farmers, within the stipulated procurement period and which conforms to the quality specifications prescribed by Government of India, are purchased at MSP (and bonus/incentive, if any) by the Government agencies including FCI for central Pool. Some States also declare State bonus on wheat and paddy over and above MSP. Government agencies undertake MSP operation at mandis/ temporary purchase centres/aggregation points. Location and number of purchase centres to be opened are decided in consultation with /by the State governments.

1. With the Food Corporation of India (FCI) sitting on huge stockpiles of food grain, the Commission for Agricultural Costs and Prices (CACP), the central government's farm price support fixing panel, has again strongly recommended reviewing the open-ended procurement policy.
2. Under the latter, government agencies buy whatever quantity of wheat and rice is brought by farmers into the mandis (wholesale markets), within the stipulated time and which conforms to fixed quality parameters for Central pool.
3. The policy, it says, has led to mounting food stocks and adversely affected crop diversification. ***"These excess stocks create storage problems and also high storage and financing costs, leading to high subsidy burden,"***

Minimum Support Prices:

1. Minimum Support Price is the price at which government purchases crops from the farmers, whatever may be the price for the crops.
2. MSP helps to incentivize the framers and thus ensures adequate food grains production in the country.
3. MSPs are supposed to act as a floor price for private traders, thereby helping avoid distress sales.
4. They are also designed to serve as a price signal to farmers, who tend to shift to crops that come with higher support prices.

**Who announces?**

The Cabinet Committee of Economic Affairs announces MSP for various crops at the beginning of each sowing season based on the recommendations of the Commission for Agricultural Costs and Prices (CACP). The CACP takes into account demand and supply, the cost of production and price trends in the market among other things when fixing MSPs.

Determination of MSP:

In formulating the recommendations in respect of the level of minimum support prices and other non-price measures, the Commission takes into account, apart from a comprehensive view of the entire structure of the economy of a particular commodity or group of commodities, the following factors:-

1. Cost of production
2. Changes in input prices
3. Input-output price parity
4. Trends in market prices
5. Demand and supply
6. Inter-crop price parity
7. Effect on industrial cost structure
8. Effect on cost of living
9. Effect on general price level
10. International price situation
11. Parity between prices paid and prices received by the farmers.
12. Effect on issue prices and implications for subsidy

The Commission makes use of both micro-level data and aggregates at the level of district, state and the country. The information/data used by the Commission, inter-alia include the following:-

1. Cost of cultivation per hectare and structure of costs in various regions of the country and changes there in;
2. Cost of production per quintal in various regions of the country and changes therein;
3. Prices of various inputs and changes therein;
4. Market prices of products and changes therein;
5. Prices of commodities sold by the farmers and of those purchased by them and changes therein;
6. Supply related information – area, yield and production, imports, exports and domestic availability and stocks with the Government/public agencies or industry;
7. Demand related information – total and per capita consumption, trends and capacity of the processing industry;

8. Prices in the international market and changes therein, demand and supply situation in the world market;
9. Prices of the derivatives of the farm products such as sugar, jaggery, jute goods, edible/non-edible oils and cotton yarn and changes therein;
10. Cost of processing of agricultural products and changes therein;
11. Cost of marketing – storage, transportation, processing, marketing services, taxes/fees and margins retained by market functionaries; and
12. Macro-economic variables such as general level of prices, consumer price indices and those reflecting monetary and fiscal factors.

Concerns / Challenges:

1. Farmer protests across the country could have significant economic and political impact.
2. Farmer protests have forced several states to waive agricultural loans, at a cost of several tens of thousands of crores.
3. India's price support programme is also promoting cultivation of water intensive crops like paddy and sugarcane even in water deficit regions such as Punjab, Haryana and Maharashtra
4. Farmers keep producing the same varieties as cropping pattern is hardly changed in some regions.
5. Rice and sugarcane occupy 25% of India's agricultural land but consume more than 60% of its irrigation water.
6. Higher MSPs over-incentivize production leading to supply glut.
7. Rice and wheat are the best examples where the government first incentivises their production and then tries not to let the prices fall by procuring more than one-third of the total produce.
8. Hikes in MSPs also adversely affect exports by making Indian farm goods uncompetitive especially when international market prices are lower.
9. That leads to increase in net domestic supply that further depresses prices forcing the government to raise duties to check imports.
10. Price deficiency payment schemes in MP and Haryana was a failure.
11. Price deficiency payment mechanism, whereby farmers, when they fail to get MSPs, could be directly paid the difference between MSP and prices they receive.

Way Forward:

1. India should now explore alternate models to boost farmers' income and stop relying on MSPs alone.
2. To improve farm income, the challenge now is to find new markets.
3. NITI Aayog is already working on alternative mechanisms.

4. A non-inflationary way to resolve the agricultural crisis is to raise farm productivity through increased investment in irrigation and post-harvest infrastructure.
5. Procurement system of the government needs to be streamlined.
6. It's time to consider a transparent, crop neutral and easier to implement income support programme— similar to what Telangana has done.
7. The state government gives a payment of Rs 10,000 per hectare of cultivable land to all farmers irrespective of the crops they raise.
8. Given its relative simplicity and non-market distorting nature, it can be replicated in the whole of India.
9. Agriculture in India needs an innovative solution to free the farmer from excessive government control.

Conclusion:

The current open ended procurement policy should continue in its current form. ***"The present policy is in the best interest of the country. Wheat and rice are basic food items. The present policy should continue in the interest of Punjab as well as the country,"***

Discuss the reasons leading to depletion of Native breeds of cattle in the country, recommend measures to preserve them. (250 words)

Reference: [The Hindu](#)

Why this question:

The government has unveiled SUTRA PIC or Scientific Utilisation Through Research Augmentation-Prime Products from Indigenous Cows – a programme to research on 'indigenous' cows. Thus the background of the question.

Key demand of the question:

The answer must discuss the reasons leading to depletion of Native breeds of cattle in the country, recommend measures to preserve them.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Start with some key facts related to the native breeds of the cattle; Cattle's rearing has been a traditional livelihood in India and is closely linked to agricultural economy. India, with its 199 million cattle heads, has 14.5 per cent of the world cattle population. Of this, 83 per cent (166 million) are indigenous.

Body:

Discuss the factors responsible for depleting breeds of cattle in the country such as – inadequate nutrition, poor reproductive management and animal diseases which is exacerbated by lack of effective support services such as animal husbandry extension, artificial insemination (AI) and/or veterinary services. Explain the efforts being made by the government in this direction; explain the Rashtriya Gokul mission, Scientific Utilization Through Research Augmentation-Prime Products from Indigenous Cows etc. Explain what more needs to be done to preserve the native breeds and highlight the benefits of the same.

Conclusion:

Conclude by reasserting the significance of preserving the native breeds.

**Introduction:**

India, one of the twelve mega biodiversity countries in the world, is home to large diversified cattle genetic resources, having 190.9 M cattle and so far 43 registered native cattle breeds. These cattle breeds are specially adapted to different agro-climatic conditions of India and their genetic diversity is due to the process of domestication over the centuries. The government has unveiled a programme to research on 'indigenous' cows. To be funded by multiple scientific ministries, the initiative, **SUTRA PIC or Scientific Utilization Through Research Augmentation-Prime Products from Indigenous Cows**, is led by the Department of Science and Technology (DST).

Body:

The National Bureau of Animal Genetic resources state that there are 41 registered breeds of cattle native to India. Based on their utility purpose, they are classified into milk breeds, draught breeds or dual purpose breeds. The indigenous breeds of cattle possess various unique characteristics such as the presence of unique genetic variation in HSP70 gene family, carry a 'thermometer gene' and presence of A2 allelic variant in cow milk, which makes them well adapted to the tropical climate

Reasons for depletion of native breeds of cattle:

1. Lack of fodder and grazing spaces, not much remuneration and change in mindset of people, adds to the woes of people in the cattle business.
2. The mechanization of farming and introduction of chemical fertilizers greatly impacted the draught breeds of cattle.
3. The other major reasons for depletion of native breeds includes **cross-breeding with exotic breeds, economically less viable, losing utility, reduction in herd size and the large-scale mechanization of agricultural operation.**
4. The **intense heat and humidity of the region** affects them and they are always sick.
5. They are **often pumped with antibiotics.**

Measures needed to conserve indigenous cattle:

1. **SUTRA PIC:** It has five themes:
 1. Uniqueness of Indigenous Cows.
 2. Prime-products from Indigenous Cows for Medicine and Health.
 3. Prime-products from Indigenous Cows for Agricultural Applications.
 4. Prime-products from Indigenous Cows for Food and Nutrition.
 5. Prime-products from indigenous cows-based utility items.
2. The conservation includes the preservation along with up-gradation (improvement) of the genetic potential and management of a breed for use in future.
3. The effective management of indigenous cattle resources includes identification, characterization, evaluation, documentation and conservation.
4. The future strategy should be to combine genetic improvement and conservation.

5. Establishment of regional gene banks and people's participation by involving breeders, communities, gaushalas, NGOs and other relevant stakeholders in conservation programs. For more effective conservation measures, proper coordination and integration among various agencies (ICAR, SAHD, SAUs, SVUs and Research Institutes) is highly needed.
6. **"National Consortium of Partners"** comprising different stakeholders should be formulated for conservation of indigenous breed resources with a holistic approach.

Conclusion:

There is a need to perform scientific research on complete characterization of milk and milk products derived from Indian indigenous cows; scientific research on nutritional and therapeutic properties of curd and ghee prepared from indigenous breeds of cows by traditional methods; development of standards for traditionally processed dairy products of Indian-origin cow.

The recent move of the union government to cap the premium on its flagship crop insurance schemes and making enrollment voluntary for these schemes will impact the agriculture sector in various ways. Discuss. (250 words)

Reference: [Indian Express](#)

Why this question:

The Centre has decided to restrict its premium subsidy in its flagship crop insurance schemes to 30% for unirrigated areas and 25% for irrigated areas (from the existing unlimited), and to make enrolment of farmers in the Pradhan Mantri Fasal Bima Yojana (PMFBY) and Restructured Weather Based Crop Insurance Scheme (RWBCIS) voluntary from the 2020 Kharif season. Thus the context of the question.

Key demand of the question:

The answer must discuss the impact of the measures taken by the union govt. on capping the premiums and making enrollment voluntary for flagship agri insurance schemes.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain the present schemes of insurance that are in existence.

Body:

The body of the answer must discuss the impact of the move – By capping the subsidy for premium rates up to 30%, the Centre wants to disincentivise certain crops in such areas where growing these crops involve high risks in terms of crop insurance premiums. While the average premium rate under PMFBY and RWBCIS at the national level was 12.32% for 2018-19, for some crops in certain districts, the rate of premium has been higher than 30% in recent years. For instance, the rate of premium for Kharif groundnut has reached 49% in Rajkot of Gujarat, and the rate for Rabi paddy crop Ramnathapuram (Tamil Nadu) has reached 42%. After the new changes come into effect, the share of the states is expected to go up in those states in which such crops are cultivated. As of now the schemes are compulsory for all loanee farmers and optional for other farmers. Non-loanee farmers under the crop insurance schemes are much fewer than loanee farmers. If the latter opt out of the schemes, the number of insured farmers will drastically come down.

Conclusion:

Conclude with multiple impacts that the move will bear on the agri sector of the country.

Introduction:

Telegram: <https://t.me/insightsIAStips>

Youtube: <https://www.youtube.com/channel/UCpoccbCX9GEIwaile4HLjwA>

Facebook: <https://www.facebook.com/insightsonindia>

Crop insurance is a vital component of agriculture, especially in a country such as India, where the majority of farmers are small and marginal with low savings that reduces their ability to weather agricultural risks and fluctuations. Recently the Centre decided to **restrict its premium subsidy** in its flagship crop insurance schemes to 30% for unirrigated areas and 25% for irrigated areas (from the existing unlimited), and to make enrolment of farmers in the Pradhan Mantri Fasal Bima Yojana (PMFBY) and Restructured Weather Based Crop Insurance Scheme (RWBCIS) voluntary from the 2020 Kharif season.

Body:

Impacts on the agriculture sector due to the proposed changes:

1. The states are already defaulting on their share, and the Centre's new cap will put an additional financial burden on them. Madhya Pradesh has not paid its share of premium even for Kharif 2018, which comes to Rs 1,500 crore.
2. As a result, **farmers have not got their claims.**
3. In fact, most states have delayed the payment of their share of premium. Sources said that in some states, the expenditure on premium of PMFBY is more than 50% of their budget for agriculture.
4. That move will lead to a rise in the rates of premium, as the area covered under insurance and the number of enrolled farmers are expected to come down significantly.
5. As of now the schemes are compulsory for all loanee farmers and optional for other farmers.
6. Non-loanee farmers under the crop insurance schemes are much fewer than loanee farmers.
7. If the latter opt out of the schemes, the number of insured farmers will drastically come down.
8. Sources say that in such a scenario, the rate of premium of certain crops in some areas may go beyond 30%.
9. The government has given flexibility to states/UTs to implement PMFBY and RWBCIS, and given them the option to select any number of additional risk covers/features like prevented sowing, localised calamity, mid-season adversity, and post-harvest losses. Earlier, these risk covers were mandatory
10. It may bring down the rates of overall premium as the state governments now will not be required to invite bids factoring these risks.
11. It will make these schemes less attractive for farmers.

Measures needed to ensure the success of Crop Insurance in India:

1. Ensure social audit
2. Utilise technology by digital money transfer to beneficiaries
3. Promote private sector participation in crop insurance segment like being done in Spain and Mexico, where government oversees agriculture insurance by private players
4. Using satellite, drones, etc. accurate and prompt data collection can be collected for providing insurance in various regions.

5. Accurate Weather forecasting using satellite imagery and advanced computer generated models can provide better and fast early warning to reduce losses.
6. Dispensing easy availability of internet to farmers will allow farmers to learn and implement new technology. Such as using Soil sensors that can broadcast real-time data about the state of the soil.
7. Improvement in Financial Services by Digitization of primary agriculture credit societies (PACs) and connecting them to district banks will allow easy loan and insurance disbursement. This will reduce exclusion as well as the delay in payments.

Food processing and related industries in India- scope and significance, location, upstream and downstream requirements, supply chain management. Land reforms in India.

Discuss the concept of Agricultural Protection Zoning (APZ). Explain in what way such methods can help control the extent of urban sprawls. (250 words)

Reference: [The Hindu](#)

Why this question:

The question is based on the concept of Agricultural Protection Zoning (APZ) and its significant contributions in curtailing the extent of urban sprawls.

Key demand of the question:

The answer must discuss the concept of Agricultural Protection Zoning (APZ) and its applications.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly explain what you understand by Agricultural Protection Zoning (APZ).

Body:

APZ refers to local zoning codes, which include provisions such as large lot size requirements and use limitations, to separate farming and related activities from other land uses.

It helps preserve the availability of agricultural lands for farming and thus the agricultural base of the community, by constraining non-agricultural development and land uses in designated areas.

Discuss the case study relevant to the question – Tamil Nadu Chief Minister has announced that the Cauvery delta region comprising of eight districts would be declared as a Protected Special Agriculture Zone.

The eight districts include Thanjavur, Tiruvarur, Nagapattinam, Pudukottai, Cuddalore, Ariyalur, Karur and Tiruchirappalli.

The move is aimed towards preventing the implementation of oil exploration projects and other hydrocarbon projects in the Cauvery delta region and will help not only ensure food security of the State but also livelihood opportunities of the farmers and other agriculture-based laborers.

Explain how such step would address the issue of urban sprawls.

**Conclusion:**

Conclude with way forward.

Introduction:

Agricultural Protected Zone (APZ) is a designated zone where farming is the primary land use and discourages other land uses in those areas. It includes separation of farming and related activities from other land uses. It is used to preserve agricultural lands and protect working farms from conversion to non-farm uses by prohibiting or restricting development on agricultural lands. The Chief Minister of Tamil Nadu recently announced that the Cauvery delta region would be declared as Protected Special Agriculture Zone.

Body:**Significance of APZ in Cauvery Delta:**

1. PSAZ is aimed at protecting the Cauvery delta region for the future, fulfilling TN's food requirements and ensuring the welfare of delta farmers.
2. It has recognised farmer concerns about hydrocarbon exploration and accorded primacy to food security.
3. Since the delta region is close to the sea, there is a need to safeguard the region.
4. Zoning protects agricultural land by minimizing land use conflicts.
5. Effective agricultural zoning ordinances protect agricultural soils.
6. Agricultural Preservation Zoning prevents land uses that are incompatible with farming.

APZ can control extent of urban sprawl:

1. APZ helps reduce the conversion of agricultural lands into peri-urban areas.
2. It helps curb land uses that are incompatible with farming like landfills, airports, golf courses etc. APZ can help preservation of farmland and discourage development of land uses that are incompatible with agricultural uses.
3. It promotes and protects dependent rural communities through the enhancement, protection, and perpetuation of the agricultural land to produce food and provide livelihood to them by protecting property rights.
4. It helps curb the distress migration and the after-effects which includes Urban sprawl.

Conclusion:

APZ has the prospect of benefiting the farming community. It will help to ensure food security of the State and livelihood opportunities of the farmers and other agriculture-based labourers.

Pulses consumption in India is showing signs of flattening explain the possible underlying causes and suggest measures to address the issue. (250 words)

Reference: [Indian Express](#)

Why this question:

The question is premised on the article by Veteran agriculture economist Ashok Gulati wherein he explains stagnant consumption trend in both milk and pulses is largely due to incomes, which aren't rising as before.

Key demand of the question:

One must examine the underlying factors responsible for this food consumption alarm that raises alert about Indians consuming less pulses and milk. Also suggest measures to tackle the issue and address it with suitable and relevant measures.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:
Introduction:

State key facts brought out by the economist in the article.

Body:

Start by explaining the underlying causes of the issue – With rising income, the consumption of milk, pulses, eggs and meat had increased, especially among the poor. Flattening demand growth for protein-rich foods suggests incomes aren't raising as before, lack of branding for pulses etc. Take cues from the article and suggest what measures should be taken to overcome this challenge, parallelly highlight the ill-effects of such a situation. Suggest solutions.

Conclusion:

Conclude with need to urgently address the issue.

Introduction:

The National Statistical Office (NSO) withheld its household consumption expenditure survey report for 2017-18 but alternative data sources do suggest a slowdown in the pulses consumption in India. Flattening demand growth for protein-rich foods suggests incomes aren't rising as before.

Body:
Trends in pulses consumption:

- Between 2013-14 and 2017-18, it rose from 18.6 million tonnes (mt) to 22.5 mt, but fell to 22.1 mt in 2018-19 and is projected to further decline to 20.7 mt this year. Some of that may be attributable to prices.
- Thus, 2015-16 and 2016-17 recorded a consumption drop alongside double-digit dal inflation.
- The peak consumption in 2017-18 was when prices actually dipped 20.8 per cent year-on-year.
- The link between consumption and inflation, however, breaks down from 2018-19.

Flat pulse

| | Consumption (lakh tonnes) | CPI Inflation (per cent)* |
|---------|------------------------------|------------------------------|
| 2013-14 | 185.91 | 4.57 |
| 2014-15 | 199.02 | 7.91 |
| 2015-16 | 195.64 | 31.67 |
| 2016-17 | 186.90 | 10.93 |
| 2017-18 | 224.95 | -20.83 |
| 2018-19 | 220.99 | -8.20 |
| 2019-20 | 207.43** | 8.70*** |

*Average year-on-year; **Projected; ***Apr-Jan.

Source: IPGA, NSO.

Causes for reduction in pulses consumption:

Telegram: <https://t.me/insightsIAStips>

Youtube: <https://www.youtube.com/channel/UCpocbcCX9GEIwaile4HLjwA>

Facebook: <https://www.facebook.com/insightsonindia>

1. There was a perception which gained ground that pulses are expensive.
2. Vegetables also turned relatively cheap and consumers started having more of them in place of dal.
3. Egg has benefitted from branding, which is lacking in pulses.
4. Data from successive annual reports of the National Dairy Development Board shows that total liquid milk marketing by cooperatives — they account for the bulk of sales in this segment — has gone up from 201.03 lakh litres per day (LLPD) in 2008-09 to 294.44 LLPD in 2013-14.
5. The average annual growth of wages in rural India during 2014-15 to 2018-19 was only 5.3 per cent in nominal terms and 0.6 per cent after adjusting for consumer inflation of 4.7 per cent.

Measures needed to increase pulses consumption:

1. There is a need for National Egg Coordination Committee-like body for pulses to push consumption.
2. The campaign they launched in the 1980s helped in positioning egg as a wholesome nutrition food.
3. The time has come for a similar sustained drive promoting pulses as an excellent source of protein, micronutrients and fibre that is also low-fat and cholesterol-free.
4. New research efforts should be initiated to achieve a breakthrough in the productivity.
5. Innovative ideas need to be implemented instead of conducting routine research and material evaluation.
6. Scientists to work for development of shorter duration, widely adaptable and biotic and abiotic stress resistant varieties to boost the production of pulses.
7. Modernization of pulse breeding programme, supporting genetic gains through transgenic technology, enhancing biological nitrogen fixation through development of super nodulating plant types and breeding short duration varieties for achieving self-sufficiency in pulses.
8. Extension workers and agriculture technology information centers should work more towards development and dissemination of newer technologies

Conclusion:

The important role that pulses can play in **sustainable crop production systems, in particular through their contribution to improved soil fertility and to agro-biodiversity** along with **providing a balanced and healthy diet as evidenced by their use by the World Food Programme and other food aid initiatives** makes it a naturally optimal choice.

Infrastructure: Energy, Ports, Roads, Airports, Railways etc.

Developing the rural infrastructure has a direct effect on the economic growth and wellness of the country; in such a context discuss the need to have a budget inclusive of tech infrastructure to cater these areas. (250 words)

Introduction:

Information and Communication technologies (ICT) have a potential for economic growth and social empowerment. Direct or indirect application of ICT, in rural development sector has also been referred to as "Rural Informatics". ICT tools are one of the most important requirement for the rural development in terms of delivery of service, delivery of information, governance, improving connectivity, market, health and education.

Body:

Significance of Rural Tech infrastructure:

- Use of modern scientific tools and techniques increased agricultural productivity manifold.
- Today, we are among the top producers of milk, wheat, rice and sugarcane.
- Latest remote sensing technologies have made the resource mapping and planning very effective in agriculture and forestry.
- With increased teledensity, ICT (Information, Communication & Technology) is making rapid inroads in rural India, revolutionalising the connectivity and information flow.
- This has opened a plethora of opportunities.
- Now ICT is being leveraged to plug leakages in the public distribution system and for better targeting of subsidies by way of Aadhar linked direct benefit transfers. It is used in tele-medicine, online study courses, e-Payments and what not.
- e-Technology can be effectively leveraged to fulfil the information needs of the rural populace such as providing weather and market related information.
- It can also be a good platform for online marketing of the artefacts produced by village artisans.

Spending on Rural Tech infrastructure of Government:

- The Government in the recent budget proposed an outlay of ₹8,000 crore over the next five years for setting up a National Mission on Quantum Technology and Applications.
- The government has already allocated ₹6,000 crore for Bharat Net, the Centre's work-in-progress rural broadband connectivity programme.
- However, the government's focus evidently lies on disruptive technologies such as artificial intelligence, Internet-of-Things (IoT), data analytics and quantum computing.

Need for an inclusive budget to have rural IT infrastructure:

- The government has been pushing every other service into the digital domain, forcing citizens to fill out forms electronically, access information online and communicate about grievances in real time via the Web.
- Telecom businesses are least interested in catering to the bottom of the pyramid when it comes to data business.
- Hence, it becomes the duty of the government to ensure villages have access to high-speed broadband.

Challenges in providing rural IT infrastructure:

- Government telcos have been a failure at providing fast Internet to the people.
- Anecdotal evidence shows that Bharat Net continues to proceed at a snail's pace.
- Lack of continuous Supply of Electricity.
- Low level of Digital Literacy: Rural India faces a severe technology deficit. The role of technology in solving problems is barely acknowledged, and the actual availability of technology in rural areas is, at best, marginal.
- Shortage of ICTs Personnel
- Unavailability of Web Content in Local Language

Conclusion:

Substantial investment is needed in physical infrastructure, power, broadband, transportation and education, particularly in rural regions and among the poorest populations in order to truly reap the benefits of the 4th Industrial Revolution.

“ Achieving the target of 30% electric mobility by 2030 looks challenging, and investment, innovation, research and development (R&D) across the right technologies will be key to achieve it ”. Discuss critically. (250 words)

Reference [Live mint](#)

Introduction

FAME India Phase II has been launched, with effect from 1 April 2019, with a total outlay of 10,000 Crore over the period of three years. Emphasis in this phase is on electrification of public transportation. The centre has sanctioned ₹8,596 crore for incentives, of which ₹1,000 crore has been earmarked for setting up charging stations for electric vehicles in India.

EVs hold enormous potential for India not only because it is environment friendly but also because India can emerge as a hub of manufacturing of EVs generating employment and growth opportunities. India has the capabilities to become the “**Detriot of EV's**”, as given by Economic Survey 2019.

Body

Indian consumer sentiment when it comes to EVs is improving, however, achieving 15% EVs within 5 years and 30% by 2030 is still faced by several challenges.

Challenges in achieving 30% electric mobility

- **The Economic survey 2019 noted that in India**, the limited availability of charging infrastructure seems to be a major impediment to increased adoption of EVs.
- Another major impediment is that of time taken for completely charging EVs, compared to conventional vehicles. Even fast chargers can take around half an hour to charge an electric car while slow chargers could take even 8 hours.
- It is equally important to provide information on public chargers to the users of EVs through online maps and other means such as physical signage.
- Range anxiety continues to be a major deterrent in EV adoption along with the challenge in achieving the convenience and the ease of use offered by traditional fossil-fuel-based vehicles.

- High initial cost, unavailability of an electricity grid system capable of meeting the demands of charging multiple EVs at the same time, as well as a limited public awareness regarding the benefits of e-mobility may hinder the widespread adoption of this technology.

Key to achieving the target

- **Investment**
 - **Electrification of the public & shared transport:** Government under FAME-II has planned to support 10 Lakhs e-2W (electric – 2 Wheeler), 5 Lakhs e-3W, 55000 4Ws and 7000 Buses.
 - **Demand incentives** on operational expenditure mode for electric buses will be delivered through State/city transport corporation (STUs)
 - Incentives will be given to 3-wheeler/4 wheeler vehicles used for public transport or registered for commercial purposes. In e-2Ws segment, the focus will be on the private vehicles
 - **Establishment of charging infrastructure**
 - About 2700 charging stations will be established in metros, million plus cities, smart cities and cities of hilly states across the country.
 - The need is to set up at least one charging station in a grid of 3km x 3km in the cities; and on both sides of highways connecting major city clusters at every 25km.
 - **Lithium :** India must invest in extraction of Lithium reserves by collaborating with Lithium triangle nations (Bolivia, Chile, Argentina). This will reduce the battery cost significantly.
- **Innovation and R&D**
 - **Fast Chargers :** are the need of the hour, especially if public transports are run on EV's for long distance.
 - **New energy vehicle (NEV) credit:** India must set a minimum requirement regarding the production of new energy vehicles (PHEVs, BEVs and FCEVs), with some flexibility offered through a credit trading mechanism in the car industry (ES 2019). **For eg,** in **China** every manufacturer is required to earn minimum NEV credits either through producing or importing NEVs or through the purchase of NEV credits from other manufacturers who have excess credit.
 - **Hybrid models :** An HEV has a conventional internal combustion engine propulsion system plus an electric propulsion system consisting of a battery and a motor. This makes HEVs heavy and expensive. There is a need for better and inexpensive models in this segment.
 - **Lithium ion batteries:** The battery management system plays a critical role in ensuring high battery performance while at the same time ensuring that the battery degradation is minimal, thus ensuring a long life for the battery. More R&D in this field will give India an edge in battery component manufacturing.

- **Fuel Cell Research Effort in India – R&D in Fuel Cells** – Fuel cells represent an emerging and exciting energy storage technology, both for stationary electricity storage as well as for electric vehicles. In India, a number of academic research efforts are ongoing in the fuel cell domain.

Conclusion

According to NITI Aayog (2019), if India reaches an EV sales penetration of 30 per cent for private cars, 70 per cent for commercial cars, 40 per cent for buses, and 80 per cent for 2 and 3 wheelers by 2030, a saving of 846 million tons of net CO₂ emissions and oil savings of 474 MTOE can be achieved. It also provides us an opportunity to grow as a manufacturing hub for EVs, provided policies are supportive. While various incentives have been provided by the government and new policies are being implemented, it is important that these policies not only focus on reducing the upfront costs of owning an EV but also reduce the overall lifetime costs of ownership.

Awareness in the fields of IT, Space, Computers, robotics, nano-technology, bio-technology and issues relating to intellectual property rights.

Why does the European Commission want a temporary ban on facial recognition technologies in public spaces? What are its implications on the use of artificial intelligence? Discuss. (250 words)

Reference: [The Hindu](#)

Why this question:

Recently, European media network EURACTIV and Politico published a story that said the European Commission is mulling a temporary ban (of up to five years) on the use of facial recognition technologies in public spaces. Thus the question.

Key demand of the question:

The answer must discuss the implications of such decisions and its effect on the use of AI as a technology.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain what facial recognition is.

Body:

Explain the current case – Two big tech companies — Alphabet and Microsoft — have taken completely different positions on the idea. Alphabet CEO Sundar Pichai is backing it while Microsoft President Brad Smith is not. This comes even as facial recognition technologies are being increasingly adopted by individuals, organizations, and governments. Then move onto explain why does the European Commission want a temporary ban on facial recognition technologies? Discuss – how is facial recognition used in today's world? When is it problematic?

Conclusion:

Conclude by suggesting way ahead; point out to a middle path to address such concerns at the same time ensuring that the benefits of the technology are not forgone.

Introduction:

Automated Facial Recognition System (AFRS) works by maintaining a large database with photos and videos of peoples' faces. Then, a new image of an unidentified person — often taken from CCTV footage — is compared to the existing database to find a match and identify the person. The artificial intelligence technology used for pattern-finding and matching is called "neural networks".

Body:

AFRS in India:

- Facial recognition systems have been active at several major Indian airports, including the Delhi airport.
- These systems at airports have been installed under the DigiYatra initiative.
- Telangana's election commission piloted a facial recognition app in its civic elections on January 22, and claimed that it could address the issue of voter impersonation.

Concerns posed by AFRS:

- The European Commission is considering imposing a five-year moratorium on the use of facial recognition technologies in the European Union (EU).

- The European Commission believes that indiscriminate use of facial recognition technologies is a privacy threat, and some regulations are needed so that this does not easily give way to surveillance.
- It is increasingly being used for everything: from unlocking your phone to validating your identity, from auto-tagging digital photos to finding missing persons, and from targeted advertising to law enforcement.
- Cyber experts across the world have cautioned against government abuse of facial recognition technology, as it can be used as tool of control and risks inaccurate results.
- In the absence of data protection law, Indian citizens are more vulnerable to privacy abuses.
- Use of surveillance cameras and facial recognition constrict the rights of particular class of people.
- In the US, the FBI and Department of State operate one of the largest facial recognition systems.
- International organizations have also condemned the Chinese government on its use of surveillance cameras and facial recognition to constrict the rights of Uighurs, a mostly Muslim minority.

Implications on the use of artificial intelligence:

- The armed forces of US and China have already invested billions of dollars to develop LAWS, intending to gain strategic and tactical advantage over each other. This runs the risks of an arms race.
- There is no clearly stated policy document or vision statement for AI development.
- AI has to meet the first and foremost challenge of acceptability with the users from the government, public sector and the armed forces, or even the private sector.
- As users of AI, their interest in the technology augmenting their own ability, and not posing a threat, is quite pertinent.
- Technical competence in this fast-paced sector, primarily in the case of government, could be a road block.
- AI can better adapt to the goals and expectations of the Indian decision makers, if the technology development is indigenous. Foreign dependence in this case would be detrimental and unproductive.
- AI has set off an **economic and technological competition**, which will further intensify.
- **LAWS** operate without human intervention, and there is formidable challenge in distinguishing between combatants and non-combatants, which is a subject of human judgment.
- **AI powered bots** have also been used to influence humans perceptions, views and opinions. Such activities are rampantly being promoted through social media platforms for various ulterior purposes using fake news, unethical advertisements, etc. which then have huge negative consequences.
- **AI based weapons** are fast gaining currency. Since humans can be replaced by such machines, declaring war would become more convenient. These machines can wreak havoc if uncontrolled endangering the human race itself.
- AI is being used for **extensive surveillance** as in China which violates right to privacy. Such intelligence can be even used to selectively target and eliminate opponents which instill deep fear among people who would like to raise voice against injustice.
- Humans can pass on their limitations to robots. E.g.: biases, prejudices, discrimination, etc. A recent report in USA revealed that robot can be racist.

Conclusion:

The transformative capability of AI is huge, and must be rooted in an egalitarian ethical basis. Any institutional framework for AI should have a multidisciplinary and multi-stakeholder approach, and have an explicit focus on the ethical basis.

‘piracy is a global beast’, In this context, critically examine the challenges involved in the e-commerce sector with respect to the threats of counterfeits and piracy with special focus on India. (250 words)

Reference: [Hindustan Times](#)

Why this question:

E-commerce in India has seen phenomenal growth over the years — from \$39 billion in 2017, it is projected to rise to \$200 billion by 2026. The question is in such a backdrop where the growth of the e-commerce sector is a welcome thing on one hand, the issues associated with piracy is another.

Key demand of the question:

The answer must discuss in detail the challenges involved in the e-commerce sector with respect to the threats of counterfeits and piracy.

Directive:

Critically examine – When asked to ‘Examine’, we have to look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgment.

Structure of the answer:

Introduction:

Briefly explain why Piracy is a global beast.

Body:

One has to explain in detail the fact that – Counterfeiting and pirated goods continue to distort the virtual marketplace. E-commerce sites are regularly being used as common platforms for the sale of counterfeit goods. Whether it is online or offline, the dangers are legitimate market loss and the occupation of economic space by unauthorized and grey market operators, causing loss of revenue to the government, loss of jobs, threat to consumer safety, and growth of organised crime. Highlight and list the challenges involved. Suggest solutions to address such challenges.

Conclusion:

Conclude by need to address the issue with a multi-pronged approach.

Introduction:

Piracy refers to the unauthorized duplication of copyrighted content that is then sold at substantially lower prices in the 'grey' market. The ease of access to technology has meant that over the years, piracy has become more rampant. E-commerce in India has seen phenomenal growth over the years — from \$39 billion in 2017, it is projected to rise to \$200 billion by 2026.

Body:

Challenges of Piracy in e-Commerce sector:

- Counterfeiting and pirated goods continue to distort the virtual marketplace.
- E-commerce sites are regularly being used as common platforms for the sale of counterfeit goods.
- The majority of copyright infringement is done through illegal reproduction of journals, magazines and books, video piracy, cable piracy, and imitation and distribution of computer programmes without the permission of the original copyright holders.

- Unlike the problem of physical piracy and counterfeiting, the piracy of content is easy and damaging.
- It is easy because the content of the original product is retransmitted and, therefore, there is no new creation, no infrastructure is required, no money is invested in creating content, and the same content of the same quality is made available to everyone for free.
- Whether it is online or offline, the dangers are legitimate market loss and the occupation of economic space by unauthorised and grey market operators, causing loss of revenue to the government, loss of jobs, threat to consumer safety, and growth of organised crime.
- when e-commerce players and brand owners get embroiled in disputes, it is the counterfeiters who reap the benefits.
- One of the greatest difficulties in tackling content theft and piracy is the jurisdictional challenge. While laws have national boundaries, piracy is a global beast. One can sit on a non-compliant jurisdiction, upload content, and make it available throughout the world. Indian laws will not be applicable in this case.

Measures needed:

- There is a need for constant upgradation and innovation to stay ahead of the counterfeiters.
- A big step has been taken by the government in bringing in the draft e-commerce policy, which has indicated clear guidelines on the expectations from brand owners and e-commerce players.
- It is the first time that a government document has listed concrete steps for combating counterfeiting.
- It categorically states that the details of sellers should be made available on a marketplace website for all products, and that sellers must provide an undertaking to the platforms about the genuineness of their products.
- Trademark owners should be given the option to register with an e-commerce platform so that wherever a trademark product is uploaded for sale on the platform, it should notify the respective trademark owner.
- If the trademark owner desires, the e-commerce platform can only list or offer for sale any of the owner's products only with prior permission.
- Additionally, in case of a customer complaint of counterfeiting after the sale, compensation will be paid and financial disincentives imposed on the seller found dealing in counterfeit products.

Conclusion:

It is important that we have regulations for e-commerce. Best practices need to be followed, technological tools and training of enforcement agencies needs to be done, the judiciary needs to be strengthened and more commercial courts opened to deal with the intricacies of IPRs, and to ascertain the extent of counterfeiting and piracy.

Conservation, environmental pollution and degradation, environmental impact assessment

The world's rivers are under unprecedented pressure from contamination, damming, and diversion, in such a situation International cooperation is the only way forward to saving of these rivers. Comment. (250 words)

Reference: [Live Mint](#)

Why this question:

The article explains that It will take global cooperation for us to save the world's rivers. It paints the bleak picture of the issues the world rivers are facing and what necessary steps are to be taken to address the issue.

Key demand of the question:

The answer must discuss the significance of global cooperation in saving the world rivers.

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

Highlight the significance of rivers in general to humanity and civilisations.

Body:

Briefly explain what the issue is. Discuss the specific issues that the rivers are facing globally. Take case studies such as of Ganga in India, damming of rivers in China and explain the various challenges and concerns. Suggest what needs to be done, highlight the importance of global cooperation to tackle the issue.

Conclusion:

Conclude by reasserting the significance of saving rivers.

Introduction:

World's rivers like the Tigris to the Indus and the Yangtze to the Nile, rivers were essential to the emergence of human civilization. Millennia later, hundreds of millions of people still depend on rivers to quench their thirst, grow food, and make a living. And yet we are rapidly destroying the planet's river systems, with serious implications for our economies, societies, and even our survival.

Body:

Threats and challenges faced by the rivers:

1. Dam-building frenzy and over-exploitation of rivers is wreaking environmental havoc.
2. Destroying forests, depleting biodiversity, and straining water resources.
3. Tapping long rivers for electricity generation.
4. The diversion of water for irrigation is also a major source of strain on rivers.
5. In fact, crop and livestock production absorbs almost three-quarters of the world's freshwater resources, while creating run-off that, together with industrial waste and sewage discharge, pollutes those very resources.
6. A point in case is of China where the first water census, released in 2013, showed that the number of rivers had plummeted by more than half over the previous six decades, with over 27,000 rivers lost.

7. In total, almost two-thirds of the world's long rivers have been modified, and some of the world's longest—including the Nile and the Rio Grande—now qualify as endangered.
8. Of the 21 rivers longer than 1,000km that still flow freely from their mountain sources to the sea, most are in remote regions of the Arctic and in the Amazon and Congo basins, where hydropower development is not yet economically viable.
9. The absence of water-sharing or cooperative-management arrangements in the vast majority of transnational river basins facilitates such destruction.
10. Many countries pursue projects without regard for their cross-border or environmental effects.

Impacts of over-exploitation of the rivers:

1. On ecosystem:

1. These trends strain water resources, destroy ecosystems, and threaten human health.
2. For example, heavy upstream diversions have turned the deltas of the Colorado River and the Indus River into saline marshes.
3. Lower river-water levels impede the annual flooding cycle, which in tropical regions helps to re-fertilize farmland naturally with nutrient-rich sediment.
4. In periods of below-average rainfall, a number of rivers increasingly run dry before reaching the ocean, and even when they do make it, they are depositing less of the nutrients and minerals that are vital to marine life.

2. On humans:

0. Humans are hardly exempt from the health consequences of river destruction.
 1. In Central Asia, the Aral Sea has all but dried up in less than 40 years, owing to the Soviet Union's introduction of cotton cultivation, for which water was siphoned from the sea's principal sources, the Amu Darya and Syr Darya rivers.
 2. Today, particles blown from its exposed seabed—thick with salts and agricultural chemical residue—not only kill crops; they are sickening local people with everything from kidney disease to cancer.
 3. Free-flowing rivers play a critical role in moderating the effects of climate change, by transporting decaying organic material and eroded rock to the ocean.
 4. This process draws about 200 million tons of carbon out of the air each year.

Measures needed:

1. One way to protect relatively undamaged river systems—such as the Amur, the Congo, and the Salween—would be to broaden implementation of the 1972 World Heritage Convention, and add these rivers to the World Heritage List, alongside Unesco World Heritage Sites.
2. This would be in line with recent efforts in some countries—Australia, Bangladesh, Colombia, India, and New Zealand—to grant legal rights to rivers and watersheds. For such initiatives to work, however, effective enforcement is essential.

3. As for the rivers that are already damaged, action must be taken to restore them.
4. This includes artificially recharging rivers and aquifers with reclaimed wastewater; cleaning up pollution; reconnecting rivers with their floodplains; removing excessive or unproductive dams; and implementing protections for freshwater-ecosystem species.

Conclusion:

The world's rivers are under unprecedented pressure from contamination, damming, and diversion. International cooperation can save them

Discuss the key findings of the "Future of the Earth report, 2020". Also discuss how it aims at reducing carbon footprint and halting global warming below 2 degree Celsius by 2050.(250 words)

Reference: [The Hindu](#)

Introduction:

The Future of Earth 2020 report has been released by the South Asia Future Earth Regional Office, Divecha Centre for Climate Change, Indian Institute of Science. The report was prepared with the aim of reducing carbon footprint and halting global warming below 2 degree Celsius by 2050.

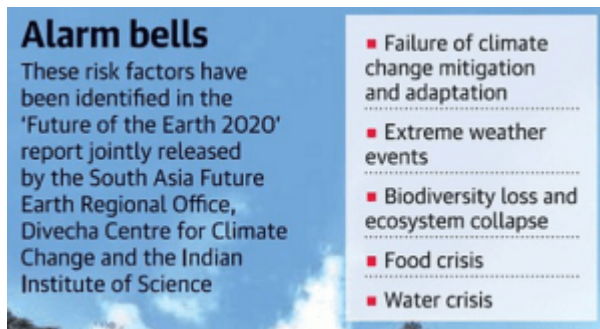

Key findings:

1. **Interrelation of risk factors:** Extreme heat waves can accelerate global warming by releasing large amounts of stored carbon from affected ecosystems, and at the same time intensify water crises and/or food scarcity.
2. **Biodiversity loss and its impact:** The loss of biodiversity weakens the capacity of natural and agricultural systems to cope with climate extremes, increasing our vulnerability to food crises.
3. The five years from 2014 to 2018 were the warmest recorded over land and ocean since 1880.

Five global risks:

The report lists five global risks that have the potential to impact and amplify one another in ways that may cascade to create a global systemic crisis. They are:

1. Failure of climate change mitigation and adaptation.
2. Extreme weather events.
3. Major Biodiversity loss and ecosystem collapse.
4. Food crises.
5. Water crises.

1. **Anthropogenic factors:** Humans have now “significantly altered” 75% of our planet’s land area; about a quarter of species in assessed plant and animal groups are threatened.
2. Strains on food production are expected to increase, as a result of various forces including climate change, biodiversity loss, and a global population on the rise.
3. **Denial of climate change:** Right-wing populism, a breed of politics that exploits people’s fears during times of economic decline and growing inequality, and that focuses on nationalist tendencies to clamp down on borders and reject immigrants, is on the rise around the world. This often leads to a denial of climate change facts or impacts.
4. **The digital platforms such as social media,** search engines and e-commerce algorithms, tend to favour the spread of information designed to engage with emotion over reason, which can cause the propagation of “fake news”, and can lead to social harms like an erosion of trust in vaccines.

It aims at reducing carbon footprint and halting global warming below 2 degree Celsius by 2050:

1. This provides an important and focused benchmark on the state of the climate, and an assessment of current efforts to limit global warming
2. The report received widespread public and media attention, and its findings continue to inform policy discussions across the world
3. It examines the pathways and options that might limit warming to 1.5°C and how response options might interact with sustainable development.
4. Although many countries have pledged to reduce their emissions under the UN Framework Convention on Climate Change Paris Agreement, the promised cuts are not enough to limit longer-term warming to 2°C, let alone 1.5°C.
5. Net-zero emissions are needed by 2050. This means that whatever emissions are produced by human activity must be balanced by the removal of greenhouse gases by natural systems (like plants) or negative emission technologies (like bioenergy or capturing and storing carbon).
6. The report assesses adaptation options that include constructing coastal barriers or planting mangroves to reduce the impacts of storms and sea-level rise; more efficient irrigation and water harvesting to conserve water; and designing buildings and planting trees to reduce urban temperatures
7. Increasing energy efficiency and renewable use help provide energy for all. Protecting forests to soak up carbon in places such as the Amazon and Indonesia can also support the goal of protecting biodiversity on land.

In India the National Education Policy will address the question of environmental health and education at the school level. ***“Children in the last four years of secondary education will have a reasonable grounding to be sensitive towards the environment. Without it no government rules and policies can be helpful,”***

Conclusion:

The UN Climate Change Summit in September 2019 called upon leaders to develop concrete, realistic plans to enhance their commitments to reduce climate risks by 2020 by reducing greenhouse gas emissions by 45% over the next decade, and to net-zero emissions by 2050, in order to limit warming to 2°C. The question is whether sufficient action will be taken, and whether humanity’s efforts to reduce warming will be compatible with sustainable development – without creating a bigger division of winners and losers.

What are Green Buildings? Do you think innovation in green buildings can help address the carbon challenge and harness an opportunity for sustainable development? Explain. (250 words)

Reference: The Hindu

Why this question:

The Bengaluru Smart City Limited (BSCL) has signed an MoU with CII’s Indian Green Building Council (IGBC) to give a boost to the Green Building Movement & Sustainable Development, and to facilitate greening of the city as per IGBC’s Green Cities Rating System.

Key demand of the question:

The answer must discuss the concept of Green building and in what way they can help in addressing the carbon challenge and attain sustainable development.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Define what Green buildings are.

Body:

A ‘green’ building is a building that, in its design, construction or operation, reduces or eliminates negative impacts, and can create positive impacts, on our climate and natural environment. Green buildings preserve precious natural resources and improve our quality of life. Then move onto discuss the salient features of Green buildings. Explain how green buildings can contribute to achieving the Sustainable Development Goals and address the carbon challenge of the world. Discuss the efforts being made by India on this front.

Conclusion:

Conclude that Green buildings can prove to be true catalysts for addressing some of the world’s most pressing issues.

Introduction:

A ‘green’ building is a building that, in its design, construction or operation, reduces or eliminates negative impacts, and can create positive impacts, on our climate and natural environment. Green buildings preserve precious natural resources and improve our quality of life. The Bengaluru Smart City Limited (BSCL) has signed an MoU with CII’s Indian Green Building Council (IGBC) to give a boost to the Green Building Movement & Sustainable Development, and to facilitate greening of the city as per IGBC’s Green Cities Rating System.

**Body:**

India's green building market is estimated to double by 2022 at 10 billion sq ft, valuing around USD 35-50 billion, driven by increasing awareness level, environmental benefits and government support.

Green buildings and sustainable development:

1. Efficient use of energy, water and other resources
2. Use of renewable energy, such as solar energy
3. Pollution and waste reduction measures, and the enabling of re-use and recycling
4. Good indoor environmental air quality
5. Use of materials that are non-toxic, ethical and sustainable
6. Consideration of the environment in design, construction and operation
7. Consideration of the quality of life of occupants in design, construction and operation
8. A design that enables adaptation to a changing environment
9. A green building's efficiency can be amplified by the adoption of innovative construction materials and better technologies.
10. These buildings rely on renewable resources, like sun, water and wind, minimize demand on non-renewable resources and maximize use through reuse and recycling.

Way forward:

1. In India, the growth of green buildings can be accelerated through standardization of norms, better incentive schemes, and a robust financial support system.
2. Increased awareness about green buildings and their long-term benefits will surely boost the green buildings sector and lead to the faster expansion of this very vital market segment.
3. growth of green building in India would be driven by increasing awareness, environmental benefits, government's support, subsidies and compulsions.

Conclusion:

Green buildings can improve the environment's ecology in numerous ways. It can reduce the energy consumption by 20-30 per cent, water usage by 30-50 per cent and significantly reduce waste generation by extensive recycling.

In what way will India's plans at UN Convention on the Conservation of Migratory Species of Wild Animals (CMS) help in sustainable management and conservation of migratory species? Give details.(250 words)

Reference: [Indian Express](#)

Why this question:

The article explains How India's proposals at UN event can help elephants, migratory birds.

Key demand of the question:

The answer must discuss the significance of such proposals made by our country that can help in sustainable management and conservation of migratory species.

Structure of the answer:

Introduction:

Briefly highlight the fact that – 13th Conference of the Parties to the CMS (CMS COP13), is under way in Gandhinagar, with “Migratory species connect the planet and together we welcome them home” as its theme.

Body:

Detail about the conventions in general first – CMS is a treaty agreed by 129 countries plus the European Union, and functions under the UN Environment Programme (UNEP). It works for protection and conservation of species that migrate across frontiers and are facing threats of extinction or require urgent attention. Explain what the convention aims to do. Then briefly explain Why do migratory species need special attention for conservation? List out the intended actions by India on this front – India has proposed inclusion of the three species on Appendix-I of the Convention. Appendix-I lists species threatened with extinction, while Appendix-II lists those in need of global cooperation for favorable conservation status. If listed on Appendix-I, it would facilitate trans-boundary conservation efforts of the species.

Conclusion:

Conclude by reasserting the significance of such measures.

Introduction:

Conservation of Migratory Species of Wild Animals (CMS) is a treaty agreed by 129 countries plus the European Union, and functions under the UN Environment Programme (UNEP). It works for protection and conservation of species that migrate across frontiers and are facing threats of extinction or require urgent attention. The 13th Conference of the Parties to the CMS (CMS COP13), which is under way in Gandhinagar, with “Migratory species connect the planet and together we welcome them home” as its theme.

Body:

India’s plans:

- India has proposed inclusion of the three species- **great Indian bustard, Asian elephant and Bengal florican**– on Appendix-I of the Convention.
- Appendix-I lists species threatened with extinction, while Appendix-II lists those in need of global cooperation for favourable conservation status.
- If listed on Appendix-I, it would facilitate **trans-boundary conservation efforts** of these species.
- India has also invited the COP13 to adopt the ‘Gandhinagar Declaration’ urging the world community to strive for ensuring ecological connectivity, especially for sustainable management and conservation of migratory species.
- The proposals cleared the first hurdle when they were adopted unanimously by the conference’s committee of the whole.
- However, Pakistan, which is the other range country of the great Indian bustard, did not take part in the discussion on the proposals.

India’s plans at CMS will help in sustainable management:

- Listing generally leads to concerted actions in different national jurisdictions in which a species ranges.
- Actions may include cooperation among range countries, harmonisation in policies etc through regional agreements.
- CMS has working groups specialising in various fauna families, and a Scientific Council that advises research-based solutions for conservation.

- Many countries started shifting towards renewable energy by building infrastructure like wind turbines, power transmission lines, solar parks; these pose risks to wildlife.
- CMS set up in 2014 an Energy Task Force; it advises contracting parties on how to keep their energy projects wildlife-friendly.
- Despite the listing and consequent efforts, 73% of 175 migratory species on Appendix-I and 48% of the 518 on Appendix-II have an overall decreasing population trend, CMS says.

Conclusion:

Besides the three species, proposals have been moved for including seven others — jaguar, urial, little bustard, antipodean albatross, oceanic white-tip shark, smooth hammerhead shark and tope shark — for listing on CMS Appendices. COP13 also discussed marine noise pollution, plastic pollution, light pollution, insect decline etc.

What are the major causes of Man – wildlife conflicts? What are the ways to prevent human animal conflicts? Explain. (250 words)

Reference: [Indian Express](#)

Why this question:

The article highlights the fact that Mitigating human-wildlife conflict must factor in incentives for local communities and presents a detailed case of Man-animal conflicts in the country.

Key demand of the question:

The answer must discuss in detail the major causes of Man –animal conflicts and the measures/methods to prevent.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly explain what constitute Man-Animal conflicts.

Body:

Briefly discuss human-wildlife conflict and its impact. Present the case of India. Discuss – human population growth and expansion, habitat degradation and fragmentation, land use transformation and increasing densities of livestock grazing in protected areas are considered as major causes of man-carnivore conflicts. Suggest ways to prevent them; take cues from the article and list down solutions.

Conclusion:

Conclude that inclusive development with a long-term vision that cares for the environment is the best way forward.

Introduction:

Man-animal conflict is an existential crisis not only for the animals, but for human beings as well with data showing that about one person has been killed every day for the past three years by roaming tigers or rampaging elephants. India is a unique country with respect to wildlife conservation. Despite a billion people we still have most of our large wildlife species. Compared to relatively lower human density countries in south-east Asia, India today has the largest population of the tiger, Asian elephant, leopard, sloth bear, gaur and many others.

Body:

Major causes of man animal conflict:

- **Unsustainable development:**
 - Tiger reserves, national parks and sanctuaries exist only as islets in a vast sea of human, cattle and unsustainable land use.
 - People are increasingly encroaching into the country's traditional wild spaces and animal sanctuaries, where people compete with wildlife for food and other resources.
 - These conflicts have increased as elephants increasingly find their usual corridors blocked by highways, railway tracks and factories
 - Urbanisation and growth agendas alter landscape dynamics, which has a cascading effect on the ecological dynamics of wildlife. This results in ecological dislocation of sorts, wherein endangered wild animals like tigers either cause distress or land themselves in trouble
- **Failure of government measures:**
 - 'Human-Wildlife conflict mitigation' said most of the measures are dysfunctional, haphazardly implemented and therefore not effective
 - Elephants are used to travelling long distances, most of which fall outside the protected areas.
 - Wildlife experts claim that territorial animals do not have enough space within reserves and their prey do not have enough fodder to thrive on. This is forcing the wild animals to move out and venture close to human habitation in search of food.
- Primary reason for the increasing human-animal conflicts is the presence of a large number of animals and birds outside the notified protected areas. Wildlife experts estimate that 29 per cent of the tigers in India are outside the protected areas.
- Road kill of wild animals is the new enemy to India's wildlife
- There is no proper land use planning and management, cumulative impact assessments or wildlife management
- There is no buffer zone between wildlife and human settlements
- Monkeys along with grey langurs have adapted to urban habitats over the years.
- Continued destruction and divergence of forest lands.

Impacts of Man-wildlife conflicts:

1. Crop Damage.
2. Animal Deaths.
3. Loss of Human Life.
4. Injuries to People.
5. Injuries to Wildlife.

6. Livestock Depredation.

Government Initiatives to reduce the man-tiger conflicts are:

- **Awareness programmes** to sensitize the people about the Do's and Don'ts to minimize conflicts
- **Training programmes for forest staff and police** to address the problems of human wildlife conflicts
- Approach by **wildlife protection act, 1972** is that the model of conservation enshrined in is premised on **creating human-free zones for the protection of rare species based on the erroneous notion that local people are the prime drivers of wildlife decline**. This approach has been successful in protecting certain species, not all species.
- Providing **technical and financial support for development of necessary infrastructure and support facilities for immobilization of problematic animals**.
- Providing LPG to villagers: LPG should be provided to those villagers who frequently go to the forest areas specially wildlife habitats to fetch fuel wood for their chullahs so that they may stop penetrating into forest and stop inviting Man- Animal Conflicts.
- **State governments:**
 - Assistance to state government for construction of boundary walls and solar fences around the sensitive areas to prevent the wild animal attacks
 - Supplementing the state government resources for payment of ex gratia to the people for injuries and loss of life in case of wild animal attacks
 - Encouraging state government for creation of a network of protected areas and wildlife corridors for conservation of wildlife.
 - **Eco development activities in villages** around protected areas to elicit cooperation of local community in management of the protected areas.
 - Supporting involvement of the research and academic institutions and leading voluntary organisations having expertise in managing human wildlife conflict situations.
 - To control poaching: Poaching of wild animals should be stopped so that the no of wild animals can stabilize at its carrying capacity which would reach equilibrium in the ecosystem and this equilibrium between the numbers of prey animals and predators in the forest ecosystem would be maintained.
- **Technology:**
 - Information technology like radio collars, GPS, satellite uplink facilities are used by research institutions to monitor the movement of wild animals
 - Centrally sponsored schemes of project tiger, project elephant and integrated development of wildlife habitats
 - **Solar Fencing around agriculture fields:** Agriculture fields situated near wildlife habitat/forest areas can be protected by stone fencing or solar fencing. Solar fencing has been tried with quite good effect in Wardha District of Maharashtra.

Way Forward:

- **Forest corridors** linking protected areas must be maintained where they exist.
- Existing habitats have to be surveyed and improved to provide food for the elephants
- **Local communities** need to be educated to have reduced stress levels in elephants during conflict mitigation, no fire, no firecracker and no mob crowds.
- There is a need for a **monitoring mechanism** which will record and disperse information on such conflicts
- Experts suggest the other way to reduce the man-animal conflict is to increase the population of wild ungulates, namely hares and the wild boars, both of which are prolific breeders, as a prey for wild carnivores. Separate big enclosures can be made in the jungles to breed them. The excess stock can be released in the jungles at regular intervals for the wild carnivores to prey upon.
- The **draft National Forest Policy** will be an overarching policy for forest management. Also there is a proposal for National Community Forest Management (CFM) Mission which will be launched soon.

Conclusion:

In order to be truly effective, prevention of human-wildlife conflict has to involve the full scope of society: international organizations, governments, NGOs, communities, consumers and individuals. Solutions are possible, but often they also need to have financial backing for their support and development

What is the current status of the green building sector in India? Is the dream of making “GRIHA for Affordable Housing” a policy idea in the right direction? Comment. (250 words)

Reference: [The Hindustan Times](#)

Why this question:

The author talks about the idea of making the government’s policy of making affordable housing inclusive of the policy of green buildings.

Key demand of the question:

The answer must discuss the current status of the green building sector in India and the benefits of the idea of making affordable housing inclusive of green buildings.

Directive:

Comment– here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

Briefly present the current status of the green building sector in India.

Body:

State key facts related to Green buildings in the Indian context. A minuscule part of India’s built infrastructure is green buildings. However, one must understand that bulk of our infrastructure is yet to be built. So there is huge opportunity to make sure that we move on the correct green path. Briefly discuss the factors that have led to slow uptake on green buildings. Explain how – access to affordable housing which is vital for achieving various social objectives can also be utilized to achieve the environmental objective too. Discuss – “GRIHA for Affordable Housing”.

Conclusion:

Conclude that linking sustainability with quality rather than pricing can create opportunities for upcoming housing projects, especially since India's socio-economic milieu warrants different perceptions of affordability.

Introduction:

A 'green' building is a building that, in its design, construction or operation, reduces or eliminates negative impacts, and can create positive impacts, on our climate and natural environment. Green buildings preserve precious natural resources and improve our quality of life. The Bengaluru Smart City Limited (BSCL) has signed an MoU with CII's Indian Green Building Council (IGBC) to give a boost to the Green Building Movement & Sustainable Development, and to facilitate greening of the city as per IGBC's Green Cities Rating System

Body:

Current status of Green building sector in India:

- A minuscule part of India's built infrastructure is green buildings.
- The Indian Green Building Council started with a modest 20,000 sq. ft. green built-up area in India in 2003.
- By 2019-end, there were more than 5,723 green building projects registered under it, accounting for over 7.09 billion sq. ft.
- But most of these projects that seek the green tag are commercial spaces.
- Only 5-7% of the green building stock is of housing projects.

Need for affordable housing in India:

- In India, access to affordable housing is vital for achieving various social objectives, including poverty reduction.
- In 2012, urban housing shortage stood at 18.8 million units and is expected to grow at 6.6% to 34.1 million units by 2022.
- Unfortunately, popular perception associates sustainability with expensive technological advances.
- **Affordability**, however, lies at the very core of sustainability. Common sense entails that if something cannot be reduced, reused, repaired, rebuilt, refurbished or recycled, it should be restricted or removed from production.

GRIHA for affordable housing – a way forward:

- The "GRIHA for Affordable Housing" rating variant was designed specifically for this purpose, and outlines at length how factors such as climate responsive design help reduce energy demand (and by extension, the electricity bills incurred by residents) at no additional capital cost.
- GRIHA AH strives to break the myth of expensive green buildings and lays emphasis on cost-effective sustainability measures.
- India is a tropical country with a requirement for space cooling for much of the year in order to maintain bearable indoor temperatures, yet affordable housing is often conceived as being required to merely provide the very basics in terms of shelter and security for the economically-challenged sections of society.
- Unlike their counterparts in commercial or high-end residential projects, the occupants of affordable housing do not have access to expensive air conditioning equipment.

- GRIHA has always emphasised the importance of no-cost design interventions for enhancing performance and meeting thermal comfort through the manipulation of architecture and building material.
- Through the AH rating system, GRIHA envisions sustainable affordable housing as habitable spaces where the occupants have both the opportunity and the desire to reside beyond the short-term, which is conducive to their socio-economic development and respectful of the natural environment.
- Linking sustainability with quality rather than pricing can create opportunities for upcoming housing projects, especially since India's socio-economic milieu warrants different perceptions of affordability.
- The underlying idea is that people should be able to maintain comfortable living standards within affordable sustainable housing.

Measures needed:

- In India, the growth of green buildings can be accelerated through standardization of norms, better incentive schemes, and a robust financial support system.
- Increased awareness about green buildings and their long-term benefits will surely boost the green buildings sector and lead to the faster expansion of this very vital market segment.
- Growth of green building in India would be driven by increasing awareness, environmental benefits, government's support, subsidies and compulsions.

Conclusion:

At the Paris Climate Conference, India pledged to reduce the greenhouse emission (GHE) intensity of its gross domestic product by 33-35% over 2005 levels by 2030. One of the key sectors that need to be factored in to meet this target is the real estate. India's building stock is expected to double in the next 15 years and buildings are expected to emerge as the largest electricity consuming sector in the country. It is crucial that new buildings in the country are designed to be energy efficient and thermally comfortable.

Climate change impact warnings for Eastern Ghats high spot the need for forest protection as an ecological imperative, Discuss the serious threat Eastern Ghats are facing and suggest remedies. (250 words)

Reference: [The Hindu](#)

Why this question:

The article talks about the Climate change impact warnings for Eastern Ghats that underscore the need for forest protection.

Key demand of the question:

One must discuss the threats that Eastern Ghats are facing from climate change and the need for urgent actions to prevent and mitigate the same.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Highlight the importance of Eastern Ghats as a key ecosystem of the country; the crown jewels of India's natural heritage.

Body:

Quote some facts and figures that bring out the importance of the Eastern Ghats. Move onto explain why serious threat from climate change, and temperature variations are a cause for worry? Discuss briefly the role that the Eastern Ghats play as a niche ecosystem. Explain what measures are required to be taken to ensure the ecosystem is conserved and preserved. Discuss the efforts of the government in this direction.

Conclusion:

Conclude by reasserting the significance of preserving such a key ecosystem.

Introduction:

The broken hill-ranges of the Eastern Ghats, spread across Odisha, Telangana, Andhra Pradesh, Karnataka and Tamil Nadu, are home to unique ecosystems. Though it has over 450 endemic plant species, the region remains one of the most exploited and degraded ecosystems of India.

Body:

Significance of Eastern Ghats:

1. The Eastern Ghats are spread across 75,000 sq. km. from Odisha to southern Tamil Nadu.
2. The region receives an annual average rainfall of 1,200 mm to 1,500 mm. The discontinuous mountain range is mainly composed of deciduous forests.
3. Sustaining biodiversity: The Eastern Ghats are home to about 3,000 flowering plant species of which nearly 100 are endemic, occurring in the dry deciduous, moist deciduous and semi-evergreen landscapes.
4. Many animals, including tigers and elephants, and some 400 bird species are found in the region.
5. Sustaining the human inhabitants: The Eastern Ghats of Odisha, Andhra Pradesh and Tamil Nadu provide forest produce and ecosystem services to millions of human inhabitants.
6. The mountain range has a key role in modulating the climate of the region.

Concerns faced:

1. The forest protection policy has failed dismally with respect to the Eastern Ghats. The Eastern Ghats have shrunk by 16% over the past century, and just one region, Papikonda National Park, has lost about 650 sq. km. in two decades from 1991.
2. Reduced productivity: New research findings note that the Ghats may be facing a serious threat from climate change. The temperature variations are the major cause of worry.
3. A disruption of the annual average temperature and diminished rainfall would drastically decrease the productivity of these deciduous forests.
4. This implies lower biomass production in the region.
5. Reduced ability to store carbon: The decreased productivity would imply the forest's reduced ability to store carbon.
6. This would affect the carbon budget of the country and further aid Climate Change.

7. The reduced ability of the critical region of Eastern Ghats to store carbon would severely disrupt India's Reducing emissions from deforestation and forest degradation (REDD) targets and plans.
8. Disrupt the life of human inhabitants: The reduced carbon-storing ability would reduce the availability of wood, a major subsistence material for the human inhabitants.
9. Affecting Biodiversity: Existing data also reveals that areas experiencing rainfall deficiency and higher temperatures have witnessed reduced plant species diversity with herbs dominating the trees.

Way forward:

1. Human needs have led to extreme pressure on the limited forest resources.
2. Relieving the pressure on forests can be done through policies that reduce extraction of scarce resources and incentivise settled agriculture. The government should help the inhabitants pursue a different occupation and more sustainable lifestyles.
3. Given that India is committed, under the Paris Agreement on Climate Change, to create an additional carbon sink of 2.5 to 3 billion tonnes through enhanced forest and tree cover, afforestation is a policy prerogative for India.
4. India, however, needs to focus on scientific afforestation.
5. Schemes for the restoration of forest peripheries through indigenous plant and tree species could qualify for international climate finance and must be pursued.
6. Moreover, improving tree cover nationally will also confer other benefits, like the modulation of the monsoons, improved air quality and wider spaces for biodiversity to persist.
7. Schemes for restoration of forest peripheries through indigenous plant and tree species, matching national commitments, could qualify for international climate finance, and must be pursued.
8. At a broader level, the response to the warnings issued by researchers from IIT Kharagpur, International Crops Research Institute for the Semi-Arid Tropics and the University of Hyderabad in a recent publication on changes to temperature and rainfall calls for decisive steps to mitigate carbon emissions.

Conclusion:

Improving tree cover nationally is certain to confer multiple benefits, including modulation of the monsoon, improved air quality and wider spaces for biodiversity to persist. Given the multiple role Eastern Ghats play, it is necessary that government take necessary steps to preserve it.

Water is a crucial concern of public health and the ecosystem of a country, more so for a country like India. Examine. (250 words)

Reference: [The Hindu](#)

Why this question:

The controversy surrounding the Bureau of Indian Standards (BIS) report of November 2019 on drinking water status has politically prioritized the issue of water quality in India, thus the question.

Key demand of the question:

Discuss in the answer why water should be treated as an urgent concern for public health and the ecosystem of the country in detail. Explain with relevant data and justifications.

Directive:

Examine – When asked to ‘Examine’, we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Initiate the discussion by highlighting the importance of water as a public good, its importance for life in general.

Body:

Discuss that India is on the verge of a severe water crisis. India has witnessed a gradual reduction in per capita availability of water due to the rising population on the one hand and also the reducing availability of potable water, on the other hand, owing to rising and unchecked pollution in the country's rivers and water bodies. Quote data to substantiate such as – A 2018 Report of the NITI Aayog has observed that currently, 600 million Indians face high to extreme water stress. By 2030, the country's water demand is projected to be twice the available supply, implying severe water scarcity for hundreds of millions of people. Discuss the problems associated with water, explain why it can be a cause of public health concern? Suggest what needs to be done? Highlight the efforts of the government in this direction such as the Jal Jeevan mission etc.

Conclusion:

Conclude that Water should be treated as an urgent concern for public health and the ecosystem of the country. Notably, the Jal Jeevan Mission has begun the important work of gathering information on the scale and scope of the problem and making it available in an open and transparent manner and there is the need to further enhance technical knowledge on measurement and regulation of water quality in India.

Introduction:

The Bureau of Indian Standards (BIS) report was released in November 2019 on drinking water status for 21 major Indian cities, in keeping with the objectives of the ‘Jal Jeevan Mission’, which aims to provide safe piped water to all households by 2024. The study is scheduled to cover all districts in the country within a year. The Union Government wants to make BIS Standards mandatory for Tap Water so as to ensure quality drinking water for all households.

Body:

Current situation of drinking water in India:

1. More than 163 million Indians – higher than the population of Russia – do not have access to safe drinking water.
2. Irrespective of the source of water, in most parts of rural India, availability of water decreases dramatically in the summer months as the water levels drop and surface sources may dry up.
3. India's estimated per capita availability of water in 2025 will be 1,341 cubic metre. This may further fall to 1,140 cubic metre in 2050, bringing it closer to becoming water-scarce.
4. NITI Aayog's Composite Water Management Index 2018, India ranks 120 out of 122 countries.
5. India is ranked 13th among the 17 most water-stressed countries of the world.

6. According to the Ministry of Urban Development, 80% of India's surface water is polluted.

Challenges faced:

1. Climate change, increasing water scarcity, population growth, demographic changes and urbanization already pose challenges for water supply systems.
2. By 2025, half of the world's population will be living in water-stressed areas.
3. Re-use of wastewater, to recover water, nutrients, or energy, is becoming an important strategy.
4. Increasingly countries are using wastewater for irrigation – in developing countries this represents 7% of irrigated land.
5. While this practice if done inappropriately poses health risks, safe management of wastewater can yield multiple benefits, including increased food production.
6. Options for water sources used for drinking water and irrigation will continue to evolve, with an increasing reliance on groundwater and alternative sources, including wastewater.
7. Climate change will lead to greater fluctuations in harvested rainwater.
8. Management of all water resources will need to be improved to ensure provision and quality.
9. No binding to the BIS standard in India.
10. The solid waste which is dumped around, toxic industrial waste, and sewage among other factors contribute to pollution of the groundwater.
11. The dissolved solids cannot be removed by chlorination.

Impacts of poor water quality:

1. Contaminated water and poor sanitation are linked to transmission of diseases such as cholera, diarrhoea, dysentery, hepatitis A, typhoid, and polio.
2. Reduction in tourist inflow.
3. Bottled water gives rise to plastic pollution due to its demand
4. RO water is totally deprived of essential minerals and salts which is necessary.
5. Reverse osmosis during water purification also results in wastage of water.

Way forward:

1. This is the first time such a data is made public and attempt has been made to study drinking water at consumer level and we should do this very frequently.
2. Citizens should be sensitized about the issue.
3. The consumers, the service providers and the government should all be equally responsible of their responsibilities
4. Long-distance supply of water should be avoided.

5. Compliance to Bureau of Indian Standards for water quality should be made mandatory for local bodies.
6. Data based decision taking system.
7. Pipelines should be maintained properly.
8. Rainwater harvesting should be done.
9. Treatment plants have to be set up
10. We need to manage underground reservoirs.
11. Sampling methodology should be proper.
12. Boiling of water is good to just kill bacteria and is not effective towards dissolved solids and require additional chemical treatment.
13. Therefore, there has to be a holistic approach towards water supply and demand.

Disaster and disaster management.

Present the governance and administration for coastal disaster risk reduction and resilience in the country. (250 words)

Reference: [PIB](#)

Why this question:

The National Institute of Disaster Management, under Ministry of Home Affairs, organized a conference on understanding the different approaches in coastal disaster risk reduction and resilience on February 25. Thus the context of the question.

Key demand of the question:

The answer must discuss in detail the aspects of governance and administration for coastal disaster risk reduction and resilience in the country.

Structure of the answer:

Introduction:

Briefly explain what you understand by the coastal disaster risk reduction and resilience.

Body:

Discuss briefly the need of it – with 7,500 km-long coastline of India being threatened by many natural hazards resulting in the loss of life and property. About 40 per cent of total population of the country lives within 100 km of coastline. Among the coastal states, Odisha, Andhra Pradesh, West Bengal and Tamil Nadu are more vulnerable to coastal cyclone disasters as compared to other coastal states. Explain the governance mechanisms that are in place with respect to it. Highlight the scope, advantages, and limitations as well as issues, challenges, and opportunities in managing coastal disaster events including the ethical perspectives.

Conclusion:

Conclude with way forward.

Introduction:

Natural disasters are events caused by the forces of nature that adversely effect on human settlements, and environment. India has been witnessing increasingly more intense and frequent climatic events and climate-induced natural disasters in recent times. The country's fragile coasts are particularly vulnerable. Intense cyclones such as the recent Fani, Gaja and Hudhud as well as severe

floods have caused massive devastation to its coastal states, Odisha, Andhra Pradesh, Tamil Nadu and Kerala, respectively. most of these states are facing significant challenges in rebuilding the critical infrastructure lost and damaged, and in recovering from the consequent disruptions caused by disasters.

Body:

Recently, the first 'National Conference on Coastal Disaster Risk Reduction and Resilience (CDRR&R) – 2020' was held in New Delhi. The one-day conference was organised by the National Institute of Disaster Management (NIDM) focused on enhancing human capacity in terms of better understanding about coastal disaster risks and effective collaborative actions, by implementing Prime Minister's 10-point agenda and Sendai Framework for Disaster Risk Reduction, for reducing the risk and enhancing the resilience amongst the affected stakeholders.

India is the third worst-affected country due to climate- induced natural disasters. The country's coastal regions, in particular, are highly vulnerable because of rapid urbanisation, high population densities and related economic activities such as agriculture, aquaculture, tourism, industries and trade. The 7,517-km-long coastline is home to 260 million people or one- third of India's population, who live in low-lying areas within 50 km of the sea coast and are perennially exposed to climate variabilities and extreme weather events.

Governance and Administrative measures:

1. **The Disaster Management Act, 2005 (DM Act 2005)** lays down institutional and coordination mechanism for effective Disaster Management (DM) at the national, state, district and local levels.
2. As mandated by this Act, the Government of India (GoI) created a multi-tiered institutional system consisting of the **National Disaster Management Authority (NDMA)** headed by the Prime Minister, the **State Disaster Management Authorities (SDMAs)** headed by the respective Chief Ministers and the **District Disaster Management Authorities (DDMAs)** headed by the District Collectors and co-chaired by Chairpersons of the local bodies.
3. They established **Disaster Management Authority (DMA)**, built cyclone and flood shelters, invested in early warning systems, created Disaster Rapid Action Force, conducted public awareness campaigns, and created a disaster loss database under the Sendai Framework for Disaster Risk Reduction (SFDRR).
4. The **National Disaster Management Plan (NDMP)** provides a framework and direction to the government agencies for all phases of disaster management

Way forward:

1. There is a need to identify scope, advantages and limitations as well as issues, challenges and opportunities in managing coastal disaster events including the ethical perspectives.
2. There is a need to explore and debate the most recent advances in the discipline, to enhance the understanding of the issues and solutions on various facets for coastal disaster risk reduction and resilience.

3. Emphasis on dissemination of information related to national and local strategies for coastal disaster risk reduction and resilience as well as to develop a network mode roadmap for addressing the gaps by engaging with the institutions, researchers and experts.

Role of external state and non-state actors in creating challenges to internal security.

What steps has Indian been taking to protect itself from the menace of drug trafficking? Elaborate on the measures it is taking to realise its vision of a Drug-free India.(250 words)

Reference: [News On Air](#)

Background:-

1. The drug trafficking scenario in India is largely attributed to various external and internal factors.
2. One of the prime external factors happens to be India's close proximity to the major opium producing regions of South West and South East Asia known as the 'Golden Crescent' and the 'Golden Triangle', respectively.
3. The geographical location of India as such, makes it vulnerable to transit, trafficking and consumption of Opium derivatives in various forms along the known trafficking routes.
4. The major internal factors responsible are illicit cultivation of Poppy and the diversion from the licit Opium sources into illicit production in interior areas.

Major trends and patterns

1. Trafficking of Heroin from South West Asia to India and then from India to Sri Lanka, Maldives and other western countries.
2. Trafficking of hashish and cannabis from Nepal to India.
3. Suspected diversion of opium from licit cultivations and indigenous production of low quality Heroin.
4. Illicit cultivation of opium poppy.
5. Wild growth of cannabis.
6. Diversion of precursor chemicals and other controlled substances.
7. Diversion of pharmaceutical preparations and prescription drugs containing psychotropic and controlled substances and their smuggling to neighbouring countries.
8. Trafficking of drugs through illicit internet pharmacies and misuse of courier services.
9. Involvement of foreign nationals in trafficking and distribution networks.
10. Trafficking of Ketamine, an anaesthetic, from India to certain destinations in South East Asia.
11. Emergence of new psychoactive substances like Mephedrone in the country.

Steps has Indian been taking to protect itself from the menace of drug trafficking:

The Government has taken several policy and other initiatives to deal with drug trafficking problem.

1. It constituted Narco-Coordination Centre (NCORD) in November, 2016 and revived the scheme of **“Financial Assistance to States for Narcotics Control”**.
2. In 2017, the government approved new Reward Guidelines with increased quantum of reward for interdiction or seizure of different illicit drugs.
3. For effective coordination with foreign countries, India has signed 37 Bilateral Agreements/Memoranda of Understanding.
4. Narcotics Control Bureau has been provided funds for developing a new software i.e. Seizure Information Management System (SIMS) which will create a complete online database of drug offences and offenders.
5. The government has constituted a fund called “National Fund for Control of Drug Abuse” to meet the expenditure incurred in connection with combating illicit traffic in Narcotic Drugs; rehabilitating addicts, and educating public against drug abuse, etc.
6. The government is also conducting National Drug Abuse Survey to measure trends of drug abuse in India through Ministry of Social Justice & Empowerment with the help of National Drug Dependence Treatment Centre of AIIMS.
7. The Narcotic Drugs and Psychotropic Substances Act, 1985, prohibit a person to produce, possess, sell, purchase, transport, store, and/or consume any narcotic drug or psychotropic substance. The NDPS Act has since been amended thrice – in 1988, 2001 and 2014. The Act extends to the whole of India and it applies also to all Indian citizens outside India and to all persons on ships and aircraft registered in India.

Status of drug de-addiction centres:

1. Rampant irregularities and torture of inmates are prevalent at New Delhi’s de-addiction centres.
2. An inspection report submitted by Delhi State Legal Services Authority (DSLISA) revealed how inmates are being ill-treated, subjected to sexual and physical torture, asked to perform sexual favours, and not allowed to contact their families.
3. Most of the centres do not have adequate infrastructure, including toilets and ventilation.
4. The report also alleged some inmates have allegedly died from the torture they were subjected to.
5. The right of basic human dignity of persons desperately in need of care and treatment is being violated with impunity.
6. Violations of fundamental rights to life, liberty and dignity, as enshrined in Article 21 of the Constitution.
7. There are unauthorised and illegally run centres, charging money and subjecting such persons to inhumane and degrading treatment.

Concerns / Challenges:

1. The alarming increase of alcohol and drug addiction.

2. Drug abuse has become common in children and adolescents and causes serious ramifications on their physical and mental health and overall wellbeing.
3. The non-availability of government sponsored de-addiction centres is paving way for private centres to exploit patients.
4. Instead of medical care, “punishments” are meted out to patients, inflicting severe torture and, in some cases, causing death.
5. People seem to forget that drug users are human beings first. By using drugs a person doesn’t cease to be human.
6. Those who become chronic drug abusers have rare chances of complete de-addiction.
7. Proximity to the largest producers of heroin – the Golden Triangle and Golden Crescent (Afghanistan-Pakistan-Iran) -has made India’s border vulnerable to drug trafficking.

Way forward:

1. Prevention and solid support are the ways in which drug abuse can be dealt with.
2. Prevention programmes involving families, schools and the immediate communities are important in this regard.
3. Government must notify minimum standards for running de-addiction centres.
4. Fast track courts.
5. Integrating drug de-addiction centre’s with rehabilitation centres.
6. Unlicensed centres and those committing human rights violations must be liable to closure.
7. A chapter on the impact of drug abuse should be included in school curriculum so that children understand how addiction destroys lives of people.
8. Focused sensitisation programmes on drug abuse in schools and a substance abuse policy could go a long way in curbing the menace.
9. Parents must consult specialists in case there is change in behaviour of their children as it could be signs of drug abuse.

Challenges to internal security through communication networks, role of media and social networking sites in internal security challenges, basics of cyber security; money-laundering and its prevention.

Discuss in detail the components of Cyber Security. Explain various mechanisms available at the international level to handle it.(250 words)

Reference: [DSCI](https://t.me/insightsIAStips)

Why this question:

The question is straightforward and is from the static portions of the GS paper III.

Key demand of the question:

The answer must discuss the various components of Cyber Security; explain the mechanisms available at the International level to address it.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain what you understand by Cyber security.

Body:

Highlight the fact that, with recent reports – one of the highest numbers of cyber threats have been detected in India and the country ranks second in terms of targeted attacks. Although Banking and Telecom are the most attacked sectors but Manufacturing, Healthcare, and Retail have also faced a significant number of cyber-attacks.

Discuss the various components of Cybersecurity – Application Security, information security, Network Security, Disaster recovery planning etc.

Then move onto explain the mechanisms available to address the threats of cybercrimes at the international level and in the country.

Conclusion:

Conclude with a way forward.

Introduction:

Cyber security is a broad spectrum phrase and relates to preventing any form of unauthorized and malafide access to a personal computer, a laptop, a smartphone or a major network like the national banking system or the railway network or a national information technology asset that also has military implications.

Various components of Cyber security

Major areas covered in cyber security are:

1. **Application Security:** Application security encompasses measures or counter-measures that are taken during the development life-cycle to protect applications from threats that can come through flaws in the application design, development, deployment, upgrade or maintenance. Some basic techniques used for application security are:
 2. Input parameter validation,
 3. User/Role Authentication & Authorization,
 4. Session management, parameter manipulation & exception management, and
 5. Auditing and logging.
6. **Information Security:** Information security protects information from unauthorized access to avoid identity theft and to protect privacy. Major techniques used to cover this are:
 7. Identification, authentication & authorization of user,
8. **Disaster recovery:** Disaster recovery planning is a process that includes performing risk assessment, establishing priorities, developing recovery strategies in case of a disaster. Any business should have a concrete plan for disaster recovery to resume normal business operations as quickly as possible after a disaster.

9. **Network Security:** Network security includes activities to protect the usability, reliability, integrity and safety of the network. Effective network security targets a variety of threats and stops them from entering or spreading on the network. Network security components include:

10. Anti-virus and anti-spyware,
11. Firewall, to block unauthorized access to your network,
12. Intrusion prevention systems (IPS), to identify fast-spreading threats, such as zero-day or zero-hour attacks, and
13. Virtual Private Networks (VPNs), to provide secure remote access.

Mechanisms available to address the threats of cybercrimes at the international level:

An overview of intergovernmental bodies and initiatives currently addressing cyber security at the policy level.

1. **Council of Europe:** The Council of Europe helps protect societies worldwide from the threat of cybercrime through the Budapest Convention on Cybercrime, the Cybercrime Convention Committee (T-CY) and the technical co-operation Programme on Cybercrime. The Budapest Convention on Cybercrime was adopted on 8 November 2001 as the first international treaty addressing crimes committed using or against network and information systems (computers). It entered into force on 1 July 2004.
2. **Internet Governance Forum (IGF):** The IGF was established by the World Summit on the Information Society in 2006 to bring people together from various stakeholder groups in discussions on public policy issues relating to the Internet. While there is no negotiated outcome, the IGF informs and inspires those with policy making power in both the public and private sectors.
3. **United Nations (UN):** The International Telecommunication Union (ITU) is the specialized agency of the United Nations which is responsible for Information and Communication Technologies.
4. ITU deals also with adopting international standards to ensure seamless global communications and interoperability for next generation networks; building confidence and security in the use of ICTs; emergency communications to develop early warning systems and to provide access to communications during and after disasters, etc.
5. **Conferences on Cyberspace:** The London Conference on Cyberspace⁵¹ (1-2 November 2011) was meant to build on the debate on developing norms of behavior in cyberspace, as a follow-up to the speech given by UK Foreign Minister Hague at the Munich Security Conference in February 2011 which set out a number of “principles” that should underpin acceptable behavior on cyberspace.
6. **Meridian Process:** The Meridian process aims to provide Governments worldwide with a means by which they can discuss how to work together at the policy level on Critical Information Infrastructure Protection (CIIP). Participation is open to all countries and targets senior level policymakers. An annual conference and interim activities are held each year to help build trust and establish international relations within the membership to facilitate sharing of
7. **NET mundial Conference:** In reaction to spying and surveillance activity by National security agency of USA through PRISM, NETmundial – Global Multistakeholder Meeting on the Future of Internet Governance was organized in a partnership between the Brazilian Internet Steering Committee and /1Net, a forum that gathers international entities of the various stakeholders

involved with Internet governance. This meeting focused on the elaboration of principles of Internet governance and the proposal for a roadmap for future development of this ecosystem.

8. **The Global Cybersecurity Index (GCI)** is a survey that measures the commitment of Member States to cybersecurity in order to raise awareness.

Conclusion:

Cyber awareness must be spread and there should be multi-stakeholder approach- technological inputs, legal inputs, strengthening law enforcements, systems and then dealing with trans-border crime involves lot of international cooperation.

Examine the role of cybersecurity in securing digital India. (250 words)

Reference: [Analytics Training](#)

Why this question:

The question is direct and aims to examine the aspects of cybersecurity and its key role in securing digital India.

Key demand of the question:

The answer must discuss the role of cybersecurity in securing digital India.

Directive:

Examine – When asked to ‘Examine’, we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Explain the fact that in the twentieth century, India saw an impetus in Information Technology (IT) and an enormous growth in e-commerce. Both these sectors ride on and reside in cyberspace involving electronic transactions, software, services, devices and networks which are highly susceptible to cyber-crimes. Hence to ensure its safety, cyber-security has become one of the most compelling priorities for the country.

Body:

Define cybersecurity, explain the key aspects briefly.

Discuss the need for cybersecurity and provide for detailed analysis.

Highlight the challenges involved in ensuring cybersecurity.

Explain the efforts being made by government of India in this direction.

Conclusion:

Suggest way forward and conclude that For the success of government initiatives like Digital India, Make in India and Smart Cities cybersecurity is quintessential in any government policy.

Introduction:

The Indian government has embarked on a programme to turn the country into a digital economy. It has unveiled a series of initiatives—from introducing Aadhaar, MyGov, Government e-Market, DigiLocker, Bharat Net, Startup India, Skill India and Smart Cities to propel India towards technological competence and transformation.

The move towards a digital economy is likely to help trigger a fresh wave of economic growth, attract more investment, and create new jobs, across multiple sectors. However, it also poses a big challenge, that of Cyber Security.

India's recent Digital transformation

India is currently pursuing “an alternative and very exciting” route in which it is making the use of digital technology and digital records in public administration with new technologies, according to IMF.

1. India is one of the key players in the digital and knowledge-based economy, holding more than a 50% share of the world’s outsourcing market.
2. India is already the third largest hub for technology-driven start-ups in the world.
3. It’s Information and Communications Technology sector is estimated to reach the \$225 billion landmark by 2020.
4. Digital India program seeks to launch a large number of e-governance services across different sectors. These include education, healthcare and banking.
5. The number of mobile phone users in India is expected to rise to 730.7 million. The number of smartphone users in India is predicted to reach 340 million and could reach almost 468 million by 2021.
6. India has made a few achievements in e-governance projects such as Digital Locker, ebast, the linking of Aadhaar to bank accounts to disburse subsidies.
7. Bharat Net (erstwhile National Optical Fiber Network), the country’s digital infrastructure, has created a common service centre for each panchayat, for which all post offices and CSCs are to be upgraded.
8. India’s mobile wallet transactions were up nine-fold in two years to reach \$9 billion.

Need For Cyber security

1. To ensure critical infrastructure system do not collapse under any situation.
2. To ensure Business continuity.
3. For the success of government initiatives like Digital India, Make in India and Smart Cities.
4. To balance Individual’s rights, liberty and privacy.

Challenges involved in ensuring cyber security:

1. New technologies such as artificial intelligence, machine learning also face new challenges for cyber security.
2. Internet of things are often not built with security
3. New technologies aid hackers too.
4. We don’t have a cyber-security mindset. People still don’t understand cyber risks to an organization
5. Most of the cyber-attacks are not reported
6. Scarcity of cyber security professionals, especially at the leadership level.
7. Cyber bullies, extremists and terrorists are creating havoc within the system.
8. India is not a signatory to the Budapest convention which is the only multilateral convention on cyber security

9. No full time cyber security experts.

India's attempts to tackle these issues:

Information Technology Act, 2000

1. The act regulates use of computers, computer systems, computer networks and also data and information in electronic format.
2. The act lists down among other things, following as offences:
3. Tampering with computer source documents.
4. Hacking with computer system
5. Act of cyber terrorism i.e. accessing a protected system with the intention of threatening the unity, integrity, sovereignty or security of country.
6. Cheating using computer resource etc.

Strategies under National Cyber Policy, 2013

1. Creating a secure cyber ecosystem.
2. Creating mechanisms for security threats and responses to the same through national systems and processes.
3. National Computer Emergency Response Team (CERT-in) functions as the nodal agency for coordination of all cyber security efforts, emergency responses, and crisis management.
4. Securing e-governance by implementing global best practices, and wider use of Public Key Infrastructure.
5. Protection and resilience of critical information infrastructure with the National Critical Information Infrastructure Protection Centre (NCIIPC) operating as the nodal agency.
6. NCIIPC has been created under Information Technology Act, 2000 to secure India's critical information infrastructure. It is based in New Delhi.
7. Promoting cutting edge research and development of cyber security technology.
8. Human Resource Development through education and training programs to build capacity.

Cyber Surakshit Bharat Initiative: It was launched in 2018 with an aim to spread awareness about cybercrime and building capacity for safety measures for Chief Information Security Officers (CISOs) and frontline IT staff across all government departments.

National Cyber security Coordination Centre (NCCC): In 2017, the NCCC was developed. Its mandate is to scan internet traffic and communication metadata (which are little snippets of information hidden inside each communication) coming into the country to detect real-time cyber threats.

Cyber Swachhta Kendra: In 2017, this platform was introduced for internet users to clean their computers and devices by wiping out viruses and malware.

International cooperation: Looking forward to becoming a secure cyber ecosystem, India has joined hands with several developed countries like the United States, Singapore, Japan, etc. These agreements will help India to challenge even more sophisticated cyber threats.

**Way forward:**

1. Real-time intelligence is required for preventing and containing cyber-attacks.
2. Periodical 'Backup of Data' is a solution to ransomware.
3. Using Artificial Intelligence (AI) for predicting and accurately identifying attacks.
4. Using the knowledge gained from actual attacks that have already taken place in building effective and pragmatic defence.
5. Increased awareness about cyber threats for which digital literacy is required first.
6. India needs to secure its computing environment and IoT with current tools, patches, updates and best known methods in a timely manner.
7. The need of the hour for Indian government is to develop core skills in cyber security, data integrity and data security fields while also setting stringent cyber security standards to protect banks and financial institutions.

Conclusion:

The government must understand that when it comes to security of cyber space and building an incident response mechanism, it is essential to establish a mode of securing information and data. It is not only the laws dealing with cybercrimes that must exist, but the collection of appropriate cyber forensics data in various jurisdictions and their presentation in courts of law. It is critical to build incident management and sharing of information with a view to building an international incident response system. What Digital India needs now is having an incident response and transnational co-operation, including establishment of appropriate mechanisms for co-operation.

“Communication networks are a part of our critical information infrastructure”, in this context, what are the threats posed by communication networks to the internal security of India? Elucidate. (250 words)

Reference: [IDSA](#)

Why this question:

The question is from the static portions of the GS paper III.

Key demand of the question:

The answer must discuss the relevance of Communication networks as a part of our critical information infrastructure; explain the threats posed by them.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:**Introduction:**

Briefly explain what constitute communication networks.

Body:

Discuss how securing the networks are complicated by a number of factors.

Explain in what way threats are posed by communication networks to the internal security of India.

Highlight the efforts being made by the country to address these concerns.

Suggest solutions to address the challenges.

Conclusion:

Conclude by way forward.

**Introduction:**

Communication networks are a part of our critical information infrastructure which was defined in the IT Act, 2000 as “the computer resource, the incapacitation or destruction of which, shall have debilitating impact on national security, economy, public health or safety.” Communications networks are crucial to the connectivity of other critical infrastructure, viz. civil aviation, shipping, railways, power, nuclear, oil and gas, finance, banking, communication, information technology, law enforcement, intelligence agencies, space, defence, and government networks.

Threats posed by communication networks to the internal security of India:

1. **Used by terrorists** – Due to the easy availability and widespread use of communication networks, most of the terrorists use this medium to achieve their goals. Around 90% of the organized terrorism on the Internet takes place through the social media. The terrorist groups spread their messages through the sites like You Tube, Twitter or Facebook and recruit people via them. For example, the terrorist group of ISIS spreads their messages and activities through the social media.
2. **International users** – The other national and international users such as the political parties, NGO's, hackers pose a serious threat using the communication networks. For example, during the civil turmoil in the Arab Spring Uprising, the various governments were threatened through the social media.
3. **Communal Violence** – With the help of social media, people have started attacking each other's religion on this platform. Sensitive tweets regarding religion are becoming a common phenomenon. Circulation of certain pictures through communication networks also creates a panic among the masses. This is a threat to the internal security of the nation as it disturbs the communal harmony.
4. **Threat to internal security** – With the advent of social media, issues like economics, media and science are open to all. Uploading information related to these fields on the social networking sites can be a threat to the internal security.
5. **Revolution** – Some countries in the world feel threatened by the fact that social media can bring the people together and thus, create a revolution. This in turn can cause political instability.
6. **Virtual Community:** Popular communication networks websites are another means of attracting potential members and followers. These types of virtual communities are growing increasingly popular all over the world, especially among younger demographics. This can build Anti-national Sentiments among Society.
7. **Hacking:** Hackers write or use ready-made computer programs to attack the target computer. By using communication networks hackers breach the national security and steal important data of defence or other strategic sectors. This can kneel the whole country without using Arms and Ammunition.

Various measures undertaken to prevent the threats:**National Cyber Security Policy, 2013:**

1. The Government of India took the first formalized step towards cyber security in 2013, vide the Ministry of Communication and Information Technology, Department of Electronics and Information Technology's National Cyber Security Policy, 2013.

2. The Policy is aimed at building a secure and resilient cyberspace for citizens, businesses and the Government.

3. Its mission is to protect cyberspace information and infrastructure, build capabilities to prevent and respond to cyber-attacks, and minimize damages through coordinated efforts of institutional structures, people, processes, and technology.

Strategies adopted by the Policy include:

1. Creating a secure cyber ecosystem through measures such as a national nodal agency, encouraging organisations to designate a member of senior management as the Chief Information Security Officer and develop information security policies.
2. Creating an assurance framework.
3. Encouraging open standards.
4. Strengthening the regulatory framework coupled with periodic reviews, harmonization with international standards, and spreading awareness about the legal framework.
5. Creating mechanisms for security threats and responses to the same through national systems and processes. National Computer Emergency Response Team (CERT-in) functions as the nodal agency for coordination of all cyber security efforts, emergency responses, and crisis management.
6. Securing e-governance by implementing global best practices, and wider use of Public Key Infrastructure.
7. Protection and resilience of critical information infrastructure with the National Critical Information Infrastructure Protection Centre operating as the nodal agency.
8. To promote cutting edge research and development of cyber security technology.
9. Human Resource Development through education and training programs to build capacity.

Cyber Swachhta Kendra' (Botnet Cleaning and Malware Analysis Centre)

1. To combat cyber security violations and prevent their increase, Government of India's Computer Emergency Response Team (CERT-in) in February 2017 launched 'Cyber Swachhta Kendra' (Botnet Cleaning and Malware Analysis Centre) a new desktop and mobile security solution for cyber security in India.

Collaboration with industry partners:

1. Development of Public Private Partnerships is an important strategy under the National Cyber Security Policy 2013. Pursuant to this aim, under the aforementioned Cyber Swachhta Kendra initiative, antivirus company Quick Heal is providing a free bot removal Tool.

International Cooperation Initiatives:

1. Information sharing and cooperation is an explicit strategy under the 2013 Policy.
2. Consequently, as an answer to the increasing international nature of cybercrime, the Indian government has entered into cyber security collaborations with countries such as the USA, European Union and Malaysia.

3. The government is drafting guidelines that will bind companies such as Twitter, WhatsApp, YouTube and Facebook to respond to complaints over content in a “few hours” as against the current norm of 36 hours.

Existing regulations on communication networks:

1. In India, social media platforms already come under the purview of the Information Technology (IT) Act, the ‘intermediary’s guidelines’ that were notified under the IT Act in 2011 and the Indian Penal Code.
2. Under existing laws, social media channels are already required to take down content if they are directed to do so by a court or law enforcement.
3. There are also reporting mechanisms on these platforms, where they exercise discretion to ascertain whether a reported post is violating community guidelines and needs to be taken down.
4. These, however, have been reported to be arbitrary – many posts on body positivity and menstruation, for instance, have been taken down in the past while other explicit imagery continues to be allowed.
5. Many of the existing regulations themselves are “dangerously close to censorship and may have a chilling effect on freedom of speech, which is why cases are being fought on those in courts.”
6. Another problem of a lot of regulatory measures is the vagueness of language which is exploited by state agencies to behave in a repressive way.

Conclusion:

Experts have suggested the setting up of a National Cyber Security Agency (NCSA) to address cyber security issues and improve implementation at a national level. Such an agency is suggested to be equipped with staff that is technically proficient in both defensive and offensive cyber operations, to encrypt platforms and collect intelligence. Another proposed measure is setting up of a National Cyber Coordination Centre (NCCC) as a cyber-security and e-surveillance agency, to screen communication metadata and co-ordinate the intelligence gathering activities of other agencies.

What is Money Laundering? How does Money Laundering work? Discuss various steps taken by government of India to prevent money laundering. (250 words)

Reference: [Legal Service India](https://www.legalserviceindia.com/)

Why this question:

The question is from the static portions of the GS paper III.

Key demand of the question:

The question aims to evaluate in detail about money laundering- definition, purpose, means etc. It also wants us to discuss the available policies such as PMLA to tackle the same.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain what Money Laundering is.

Body:

Write a few lines about the meaning of money laundering- e.g Money laundering is the process of creating the appearance that large amounts of money obtained from criminal activity, such as drug

trafficking or terrorist activity, originated from a legitimate source. The money from the illicit activity is considered dirty, and the process “launders” the money to make it look clean.

Discuss the steps in money laundering- Placement-criminally derived funds are introduced in the financial system; Layering-the property is ‘washed’ and its ownership and source is disguised; Integration-‘laundered’ property is re-introduced into the legitimate economy; This three staged definition of money laundering is highly simplistic. The reality is that the so-called stages often overlap and, in some cases, for example in cases of financial crimes, there is no requirement for the proceeds of crime to be ‘placed’. Briefly explain how globalization impacts money laundering. Examine the recent policy efforts taken by the government – India is a full-fledged member of the Financial Action Task Force (FATF), PMLA 2002, and Financial intelligence unit -IND etc.

Conclusion:

Conclude with way forward.

Introduction:

Money laundering is the process of creating the appearance that large amounts of money obtained from criminal activity, such as drug trafficking or terrorist activity, originated from a legitimate source. The money from the illicit activity is considered dirty, and the process “launders” the money to make it look clean.

How does Money Laundering Work?

A case of Money laundering ostensibly appears to be an above-board financial transaction, however, the criminality underneath is hidden by a three stage process:

1. **The first stage** is when the crime money is injected into the formal financial System. This is called ‘placement’;
2. **In the second stage**, money injected into the system is layered and spread over various transactions with a view obfuscate the tainted origin of the money. This process is called ‘layering’;
3. **In the third and the final stage**, money enters the financial system in such a way that original association with the crime is sought to be obliterated so that the money can then be used by the offender or person receiving as clean money. This is called ‘Integration.

Efforts of Government of India to address money laundering:

In India, before the enactment of Prevention of Money Laundering Act, 2002 (PMLA) the major statutes that incorporated measures to address the problem of money laundering were:

PMLA Act:

1. It prescribes obligation of banking companies, financial institutions and intermediaries for verification and maintenance of records of the identity of all its clients and also of all transactions

and for furnishing information of such transactions in prescribed form to the Financial Intelligence Unit-India (FIU-IND).

2. It empowers the Director of FIU-IND to impose fine on banking company, financial institution or intermediary if they or any of its officers fails to comply with the provisions of the Act as indicated above.

3. PMLA envisages setting up of an Adjudicating Authority to exercise jurisdiction, power and authority conferred by it essentially to confirm attachment or order confiscation of attached properties.

The Black money (undisclosed foreign income and assets) and Imposition of Tax Act, 2015:

1. To deal with the menace of the black money existing in the form of undisclosed foreign income and assets by setting out the procedure for dealing with such income and assets.

Benami Transactions (Prohibition) Amendment Bill, 2015:

1. It aims to expand the definition of Benami Transactions and specifies the penalty to be imposed on a person entering into a Benami transaction.

Institutional framework:

Enforcement directorate:

1. PMLA empowers certain officers of the Directorate of Enforcement to carry out investigations in cases involving offence of money laundering and also to attach the property involved in money laundering.

Financial Intelligence Unit:

1. It was established in India in 2004 as the central national agency responsible for receiving, processing, analyzing and disseminating information relating to suspect financial transactions.
2. FIU-IND is also responsible for coordinating and strengthening efforts of national and international intelligence, investigation and enforcement agencies in pursuing the global efforts against money laundering and related crimes.
3. FIU-IND is an independent body reporting directly to the Economic Intelligence Council (EIC) headed by the Finance Minister.

Way forward:

1. Make common people more aware about the problem- The poor and illiterate people, instead of going through lengthy paper work transactions in Banks, prefer the Hawala system which needs to be stopped.
2. Fulfilling the purpose of KYC Norms by doing proper KYC.
3. Establishment of comprehensive enforcement agencies
4. Promote cashless digital transaction

Conclusion:

The Indian government is serious about curbing money laundering so India has to focus on financial literacy education so that people are aware.

Modern computing devices are not safe when it comes to the issue of security vulnerabilities in technology use. Do you agree? Examine. (250 words)

Introduction

Jeff Bezos who is the founder of Amazon and world's richest man became a victim of phone hacking, showcases that security vulnerabilities of modern devices and technology are ubiquitous in nature.

Body

Security Vulnerabilities and Techniques to exploit them

- **Spyware: Pegasus**, a spyware was in news and according to WhatsApp, the spyware was **deployed on at least 1,400 targets**, including lawyers, activists, dissidents and diplomats. The Pegasus spyware is also known to have been used **against several Indian journalists and activists**.
 - Sensitive information were extracted from the target users' phone.
- **Denial of Service : Saposhi Malware** is capable of taking over electronic devices and turning them into bots (device taken over by malware) which can then be used for any purpose, including DDoS attacks which, with enough firepower, can cripple entire industries.
 - It overloads the server, rendering it non-responsive.
- **Ransomwares** : It is a type of malware that prevents users from accessing their system or personal files and demands ransom payment in order to regain access. **Eg : WannaCry, Petya**
 - This can have a serious harm to critical government infrastructure and it's data security.
- **Hacking** : It can occur through phishing, spam mails that mask virus as executables or exploiting a badly written code in the software
 - Eg : The Ring security system(camera) of Amazon was hacked in USA, and hackers used a racial slur on a child through the camera.
- **Using old Operating Systems** : Eg : ATM's with windows XP became vulnerable to network spoofing.

Steps to address these issues

- **At user-level**
 - **Basic Security Hygiene** : Not visiting untrusted websites, installing untrusted third party applications or certificates, keeping device and application software updated is needed.
 - **Using licensed software**: Users must ensure pirated software are not used and also update latest security patches to their devices.
 - **Non-disclosure of sensitive information**: Awareness to ensure people are not deceived by unscrupulous actors regarding confidential information. **Eg: Bank Login, OTP, debit/credit card details.**
 - **Using trusted software**: Users must not give unbridled access to phone's content to suspicious apps.

- **Two-layer authentication:** Strong passwords with OTP login can help secure devices, apps from unauthorized access.
- **At Government level: Initiatives**
 - **CERT-IN is the national nodal agency to respond in crisis situation.**
 - **CERT-fin** has also been launched exclusively for financial sector.
 - CERT-in is also operating **Cyber Swachhata Kendra**, a Botnet Cleaning and Malware Analysis Centre
 - **National Critical Information Infrastructure Protection Centre (NCIIPC)** to battle cyber security threats in strategic areas such as air control, nuclear and space.
 - **Cyber Surakshit Bharat** Initiative to strengthen Cybersecurity ecosystem in India. It is first public private partnership of its kind and will leverage the expertise of the IT industry in cybersecurity.
 - National cyber coordination centre (**NCCC**) to scan internet traffic coming into the country and provide real time situational awareness and alert various security agencies.
 - Cyber Forensic Lab set up in Bangalore, Pune, Kolkata in collaboration with NASSCOM.

Conclusion:

Device Security must be enhanced through continuous research and development to create secure hardware and software. Meanwhile user awareness is equally necessary to prevent them from becoming victims of cybercrime.

Discuss the role of media and social networking sites in internal security challenges.
(250 words)

Reference: [IDSA](#)

Why this question:

The question aims to analyse different internal security threats arising from social media and social networking sites.

Key demand of the question:

The answer must discuss the role of media and social networking sites in internal security challenges of the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly define what constitutes social media.

Body:

First highlight the fact that Media is considered as influential channel for effective communication. It supports in promoting the right things on proper time. It provides a real exposure to the mass viewers about right or wrong process.

Then move onto discuss the challenges that it poses.

Discuss Social media as a threat to national security; explain how it aids propagate fundamentalism, fake news etc.

Suggest how government should tackle these issues.

**Conclusion:**

Conclude with way forward, suggesting suitable solutions.

Introduction:

Today the Media and Social media has created a borderless world while it's reach is ubiquitous. **Media** are the communication outlets or tools used to store and deliver information or data. The term refers to components of the mass **media** communications industry, such as print **media**, publishing, the news **media**, photography, cinema, broadcasting (radio and television), and advertising. The term "social media" refers to internet-based applications that enable people to communicate and share resources and information. While they have enabled faster communication, there are many challenges associated with them as well.

Body**Role of Media**

Media is considered as influential channel for effective communication. It is the **fourth estate of democracy**. Media helps the people to be aware about and develop a consensus upon important national and international development issues. It also helps them understand the various obstacles in the process of development. imbining basic skills among the people.

Challenges to Internal Security

- **Unverified News:** In recent times because of proliferation of news channels, dissemination of unverified news and one sided information by some unscrupulous news channels have emerged.
 - Such actions of media have negative impact on long term internal security.
- The concept of **breaking news** have many a times detrimental effect on National Security. **Amplifying the fear factor** through news reporting, live telecast of sensitive information are some of the concern areas here.
 - For example, during the time of Mumbai terror attacks TV channels live telecasted operations by security forces.
- Extreme focus on **TRP** has led to media highlighting **divisive issues**. This can lead to sectarian violence or communal riots.
- This has also been aggravated by spread of social media which is taking the shape of public sourced media and also as a barometer of acceptance & popularity.
 - This has made media houses ignore objective reporting and playing to the tunes of masses who don't have knowledge of long term ill-effects of such things.

Role of Social Media

There are more than **500 million internet users** in India and today social media is not only a subset of internet rather the internet itself.

Challenges to Internal Security

- **Flash Crowds:** The Spread of social media and cell phones has created the phenomenon of 'flash crowds'.
 - **Eg: Lynching, rioting based on rumours.**

- **This was seen at the site of encounters in Kashmir Valley.**
- **Propaganda:** In addition, social-media platforms like face book, WhatsApp and you tube are being used to great advantage to carry out propaganda.
 - **Burhan Wani**, whose killing led to a bout of violence in the Kashmir valley was a creation of internet and facebook.
 - It is being used for promotion of violence, recruitment, incitement and **radicalization**.
 - It can instigate violence against communities as well.
- **Recruiting youth for Terror outfits:** The **ISIS** recruited youth from Maldives, Bangladesh, United Kingdom to fight in the Syrian War, through social media.
 - Training is imparted through social-media for youth to carry out militancy.
 - Increasing IS sympathizers through pro-IS content distributed online.
- **Fake news with malicious intent:** Manipulation through the social media allegedly spurred the mass exodus of north east Indians in Bangalore in 2012.
- **Money Laundering and organized crime** are increasingly happening through online activity covertly.
 - Concept of **Money Mules:** Unsuspecting individuals are recruited as 'money transfer agents' (mules) to avoid high transaction charges or local taxes. This leads to wiring huge amounts from offshore accounts to the money mule.
- **Drug Peddling:** The **Dark Web** is the hub of smuggling drugs illicitly. The problem has exacerbated with cryptocurrencies like bitcoin, ripple, ethereum.
- **Other Challenges posed by social media**
 - **Accountability issues:** Challenges with respect to fixing the liability of intermediaries. It is also difficult to trace the origin of fake news circulation.
 - **Jurisdictional challenges:** Complications in jurisdiction as Facebook, twitter etc. operate as subsidiaries of foreign internet companies with their servers located outside India.
 - **Anonymity:** Police officers have expressed concern over multiplicity of fake profiles. There is no accountability of a crime.
 - **Encrypted Message:** Use of whatsapp to send and receive messages, concerns the government because the communications sent via such devices and applications are encrypted.

Way Forward

- **Auto-filters:** They must be put in place to detect and remove messages with violence, hatred and anti-nationalism.
- **Self-Regulation and enforcement:** The media houses must evolve their own code of ethics and self-regulation mechanisms through which actions against those acting against the interest of the national security can be taken. If need be, stringent laws must be made.

- Governments must also be proactive and must continuously provide immediate, accurate and reliable information so that public is not influenced by sensational and biased news reporting.
- **Proactive web monitoring:** The Mumbai Police has launched a project called “**Social Media Lab**” to check explosive content on various platforms and quell fake news.
- Initiatives such as ‘**WhatsApp’s Checkpoint Tipline**’, ‘**The Logical Indian**’ should create user awareness regarding fake news.
- **Crisis Protocols:** Creating a crisis protocol for responding to emerging or active events, on an urgent basis, so relevant information can be quickly and efficiently shared, processed, and acted upon by all stakeholders with minimal delay.
- **Global cooperation: Christchurch Call of Action** outlined voluntary commitments from governments, ISP’s to address issue of violent extremist content online. India is a signatory to this plan

Conclusion:

The press has always acted as a medium of communication between the public and the leaders. Social media add another dimension to the existing media by making the two-way channel of communication more efficient.

But, there is a need to overcome the Digital Anarchy to protect against internal security challenges. Developing a well-operated online intelligence network for intelligence sharing, joint online operations and database convergence to keep a check on social-media posts is the need of the hour.

What is Darknet? Discuss the key challenges involved in fighting the Darknet. Also suggest strategy to deal with it. (250 words)

Reference: [The Hindu](#)

Why this question:

The question is straightforward and aims to analyse the key challenges involved in the applications of Darknet and the prevalent misuse of it.

Key demand of the question:

The answer must discuss the challenges involved in fighting the Darknet while suggesting strategy and solutions to deal with it.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Explain what Darknet is.

Body:

Dark Net is an umbrella term describing the portions of the Internet not open to public view or hidden networks whose architecture is superimposed on that of the Internet. Explain what are the challenges involved with it; Misuse: Computer crime (hacking, file corruption etc.), Sale of restricted goods on Darknet markets, File sharing (personal files, pornography, confidential files, illegal or counterfeit software etc.) The Dark Web is often used by individuals who want to preserve anonymity. That includes criminals, terrorists and state-sponsored spies. The Dark Web does contain websites selling illicit goods, including drugs etc. Discuss why it is difficult to tackle – virtual presence, no restricted geographical boundaries etc. Suggest solutions to address the challenge like – Introduction of technology-savvy youngsters into the cyber department in large numbers, Hiring of experienced foreign law-enforcement professionals, who have experience in similar operational security and applicable law.

**Conclusion:**

Conclude by reasserting upon the need to address the issue with greater urgency.

Introduction:

Dark Net (or Darknet) is an umbrella term describing the portions of the Internet not open to public view or hidden networks whose architecture is superimposed on that of the Internet. Darknet provides anonymity to the users. Darknet is often associated with the encrypted part of the Internet called Tor network where illicit trading takes place such as the infamous online drug bazaar. A variety of Darknet markets (black markets) allow for the anonymous, illegal buying and selling of drugs and other illegal or controlled substances, such as pharmaceuticals, and weapons. The services and websites running on the Darknet is the dark web.

Body:**Key challenges involved in fighting the Darknet:**

1. A large portion of the activity which takes place on the dark net is illegal. The dark net offers a level of identity security that the surface net does not.
2. Dark net is the virtual equivalent of a black market.
3. Criminals looking to protect their identities in order to evade detection and capture are drawn to this aspect of the dark net. For that reason, it's unsurprising that a number of notable hacks and data breaches have been associated with the dark net in some way or another.
4. The relative impermeability of dark net has made it a major haven for drug dealers, arms traffickers, child pornography collectors and other criminals involved in financial and physical crimes so much so that one can buy anything from tigers to hand grenades to any kind of narcotic substances, provided the potential buyer finds the right website on the dark net.
5. One of the most famous examples of a dark network was the Silk Road marketplace. Silk Road was a website used for the buying and selling of a variety of illegal items, including recreational drugs and weapons. Although it was shut down by government authorities in 2013, it has spawned a number of copycat markets.
6. Used by Activists and revolutionaries to organize themselves without fear of giving away their position to governments they oppose.
7. Terrorists use dark net to provide information to fellow terrorists, to recruit and radicalize, to spread propaganda, raise funds, and to coordinate actions and attacks.
8. Terrorists also use the dark net for illegal purchase of explosives and weapons, using virtual currencies like Bitcoin and other crypto-currencies.
9. Security experts are claiming that hackers and fraudsters have started to offer access to SCADA and ICS systems via discussion forums on the dark web, potentially compromising vital infrastructure networks across the world.

Strategies to tackle Darknet:

1. Given the increased importance of cryptocurrencies in the financial world, it's possible that dark nets will become more of a feature for everyday Internet users in the future.

2. In the meantime, they may also still provide criminals with a means of eluding capture, although true anonymity is never guaranteed, even when using encryption of the type found in these networks.
3. Governments across the world should strengthen their Cybersecurity Framework to deal with the threats posed by dark net. They must cooperate with each other regarding securing the Cyberspaces worldwide through intelligence, information, technology and expertise sharing.
4. India should invest enough in research and development and training and capacity building of personnel in the field of Cybersecurity.
5. Kerala Police Department's initiative, **Cyberdome**, a premier facility dedicated to prevent cybercrime and mitigate cybersecurity threats to the State's critical information infrastructure, is a step in right direction which other concerned authorities across the nation can learn from.

Way forward:

1. The Information Technology Act deals with cybercrime and comes under the Ministry of Electronics and Information Technology. There are only six sections in the law that deal with cybercrime.
2. With the changing times, India needs a code of criminal procedures dealing with cybercrime that would come under the Ministry of Home Affairs, which deals with policing issues.
3. Also, there is a need for police, trained in changing cyber trends who are dedicated only to cybercrime and not transferred to other police units.

One in every three adolescents in the country is exposed to the Internet are victims of one or the other forms of online abuse, why is the issue? Explain and list out strategies on prevention, reporting and redressal of the same. (250 words)

Reference: [The Hindu](#)

Why this question:

In an attempt to assess the pattern of Internet use and online safety, an NGO — Child Rights and You (CRY) — conducted a survey in collaboration with Forum for Learning and Action with Innovation and Rigour (FLAIR). Hence the question.

Key demand of the question:

The answer must discuss the reasons for rising online abuse with special focus on adolescents and list down strategies on prevention, reporting and redressal of it.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly explain what constitutes online abuse.

Body:

Start with the facts and findings of the report –

One in every three adolescents exposed to the Internet are victims of cyber bullying and other forms of online abuse and nearly half of the users display some level of addiction.

Adolescents had easy access to the Internet with 93% of them using it in their homes. There was a clear gender disparity in access to personal devices with 60% boys and 40% girls owning a device.

Thirty percent of adolescents had a negative experience online.

Lack of awareness among the students on the Internet safety guidelines developed by the NCERT with only 30% respondents being familiar with them etc.

Discuss the causative factors underlying the issue. Suggest recommendations as to what needs to be done? –build familiarity with Internet safety rules and the skill to use them for reporting to be built into the school curriculum as well as the need to modify the Central government’s child protection scheme to build infrastructure to deal with cybercrimes against children. Press for schools to recognise an increase in online crimes against children and develop strategies on prevention, reporting and redressal etc.

Conclusion:

Conclude with way forward.

Introduction:

A recent report to assess the pattern of Internet use and online safety, an NGO — Child Rights and You (CRY) — conducted a survey in collaboration with Forum for Learning and Action with Innovation and Rigour (FLAIR) was released. It reported that one in every three adolescents exposed to the Internet are victims of cyberbullying and other forms of online abuse and nearly half of the users display some level of addiction

Body:

Cyber Bullying:

- Cyberbullying or cyber harassment is a form of harassment that takes place over digital devices like cell phones, computers, and tablets.
- Cyber bullying can occur through SMS, Text, and apps, or online in social media, forums, or gaming where people can view, participate in, or share content.
- It includes sending, posting, or sharing negative, harmful, false, or mean content about someone else.
- It can include sharing personal or private information about someone else causing embarrassment or humiliation.
- Some cyber bullying crosses the line into unlawful or criminal behaviour.

Reasons for increasing Cyber bullying:

- The increasing access to affordable data service has given rise to these faceless evil worldwide – young children, in particular teenagers, being the most vulnerable victims.
- The language and content of Web series: The certain shows running on amazon prime or Netflix are not appropriate for teenagers. Teenagers try to adapt that language used in the TV series or shows.
- Nuclear families and isolation of children: Most of the families in India are nuclear families and parents are going to their job regularly so the children’s get neglected and isolated. Therefore, many are not able to identify what the child is going through.
- Cyber bullying, under the Information Technology Act, is not an offence. The Act was last amended in 2008. Since then, social media has exploded in the country. The ground reality of 2017 is vastly different
- Cyber bullying does not qualify in the category of cognizable criminal offences. Only if it is in aggregated form for example, someone created fake profile of others and used that account for detrimental things that only qualifies as offence of impersonation.
- Most of the time the victim is a juvenile but at the same time the person who is committing this crime is also a juvenile and therefore this is covered under juvenile justice act. So the role of

police authority in the conventional manner is limited hence registering an FIR and arresting the juvenile, these scenarios are not possible

- Under-reporting of cases. The reasons are People don't want unnecessary media publicity; the current process is very slow; and there is low confidence in the ability of the system
- The US has often failed to share information vital to dealing with cybercrime. It denies access to data held by companies such as Google and Facebook
- Because Cyberbullying is difficult to track, many victims feel helpless and unable to cope with it, especially if the bullying is personal and long-drawn

Government Initiatives against Cyberbullying:

- Guidelines by NCERT: Because of lack of awareness about cyber bullying among the children's, teachers as well as the parents, NCERT came up with three guideline booklets one for teachers one for school and one for students. For students it's in the form of DO's & DON'Ts.
- Government of India is come up with ministry of home affairs Cybercrime reporting portal gov.in.
- For generating awareness in state of Delhi, Delhi police has come up with an initiative in which Police visits school administration to get aware of cyber bullying and also engage workshops for computer teachers.

Other measures needed:

- Parents can make a vast and positive difference by talking with their children. Like sexuality education in general, the topic of pornography is not one big talk but rather a series of discussions that easily can arise from the content of songs, music videos, video games, movies and unintended or intended exposure to sexually explicit images.
- Parents can help their children develop a critical eye when viewing media, so they see the lies, and differentiate that fiction from the joy in loving equitable and respectful relationships.
- **National Cyber Crime Reporting Portal** shall be designated as the national portal under-reporting requirements in the POCSO Act in case of electronic material
- Union Government shall be empowered through its designated authority to block and/or prohibit all websites/intermediaries that carry child sexual abuse material
- Law enforcement agencies should be permitted to brake end to end encryption to trace distributors of child pornography.
- Use of Artificial intelligence:
 - Tools can be developed which can analyse the behaviour of every internet user. So it can help prevent the user from falling into cyber bullying.
 - Developing some mobile applications that can alert parents if the child is under threat of cyber bullying.
 - Prevent malware attacks by tying up with antivirus agencies.
- Academic measures:
 - The subjects related to cyber bullying and cyber security should be made mandatory instead of only guidelines.
 - In school there should be cyber cell where one could report their grievances whether by its name or anonymously.
- Multipronged approach to handle cases: Need to handle the cases of cyber bullying through multipronged approach such as counselling through Psychiatrist, approaching police, etc.
- Schools shall undertake training programmes for parents at least twice a year, making them aware of hazards for children of free access to smartphones, internet at an early age.

Discuss the concept of Data localization envisioned by the Personal Data Protection (PDP) Bill, 2019. What are the concerns associated with operationalizing data localization in India? Explain. (250 words)

Reference: [The Hindu](#)

Why this question:

The article discusses why the issue of data localization is important for a country and the issues with the policies related to data localization. Such issues have become important, because of the debates raised by Srikrishna committee. The article would help us prepare the issue of data localisation which has been an issue of debate.

Key demand of the question:

The answer must discuss the significance

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly explain

Body:

Bring out the reasons why data localization is important – security, data as a resource, socio economic benefits. The reasons have to be brought out in detail. Mention that Data has often been referred to as the new oil, an economic resource that is fuelling the fourth industrial revolution.

Thereafter, we need to analyse the policies related to data localisation. Mention that like in many other countries, the political narrative in India also seems to be tilting towards data localisation. Highlight the Indian policies related to data localisation.

Discuss the rationale behind them and also analyze whether they help in furtherance of the objective of data localization. Also mention Srikrishna committee recommendations related to data localisation.

Explain the issues associated in detail and ways to overcome them.

Conclusion:

Give your view on the present policies related to data localisation and suggest way forward.

Introduction:

The Personal Data Protection (PDP) Bill, 2019 was referred to a joint parliamentary committee, which is currently engaged in a process of public consultation. The draft law is a comprehensive piece of legislation that seeks to give individuals greater control over how their personal data is collected, stored and used. Once passed, the law promises a huge improvement on current Indian privacy law, which is both inadequate and improperly enforced.

Body:

Data localisation refers to the process of storing data within the borders of a particular country where the data was generated. India's recent drafts and statements have strong signals for data localisation, which means that data of Indians, even if collected by an American company, must be stored and processed in India. Worldwide, the data flow debate is playing out at the World Trade Organisation (WTO) and G20.

Importance of Data localization for India:

- For securing citizen's data, data privacy, data sovereignty, national security, and economic development of the country.

- Much of the data from online sales, on ecommerce platforms is likely to be hosted and stored in US data firms.
- The extensive data collection by technology companies, has allowed them to process and monetise Indian users' data outside the country.
- To curtail the perils of unregulated and arbitrary use of personal data
- With the advent of cloud computing, Indian users' data is outside the country's boundaries, leading to a conflict of jurisdiction in case of any dispute.
- Data is a digital transactions footprint. During war or hostilities, data centres could be switched off. Such scenarios are pushing countries towards local infrastructure.
- Economic benefits will accrue to local industry in terms of creating local infrastructure, employment and contributions to the AI ecosystem.
- Regarding the protection of civil liberties, the argument is that local hosting of data will enhance its privacy and security by ensuring Indian law applies to the data and users can access local remedies.

Concerns associated with operationalizing data localization in India:

- One of the more contentious issues in the law Bill are the provisions pertaining to "data localisation".
- The phrase, which can refer to any restrictions on cross-border transfer of data (for instance, requirements to seek permission for transfer, the imposition of taxes for foreign transfers of data, etc.), has largely come to refer to the need to physically locate data within the country.
- The PDP Bill enables the transfer of personal data outside India, with the sub-category of sensitive personal data having to be mirrored in the country i.e. a copy will have to be kept in the country.
- Data processing/collecting entities will however be barred from transferring critical personal data (a category that the government can notify at a subsequent stage) outside the country.
- The 2018 draft imposed more stringent measures that required both personal and sensitive personal data to be mirrored in the country (subject to different conditions).
- On closer examination it appears that even the revised law may not actually stand the test of proportionality.

Way forward:

- There is an urgent need to have an integrated, long-term strategy for policy creation for data localisation.
- Devising an optimal regulatory and legislative framework for data processors and data centres operating in the country.
- Adequate infrastructure in terms of energy, real estate, and internet connectivity also needs to be made available for India to become a global hub for data centres.
- Adequate attention needs to be given to the interests of India's Information Technology Enabled Services (ITeS) and Business Process Outsourcing (BPO) industries, which are thriving on cross border data flow
- Data needs to be shared with start-ups so that they can have a level playing field in offering innovative services with large and often global data companies.

INSIGHTSIAS

SIMPLIFYING IAS EXAM PREPARATION

INSTA SECURE SYNOPSIS **MAINS 2020**

GS-III

JANUARY 2020

Indian Economy and issues relating to planning, mobilization of resources, growth, development and employment.

Examine the role of small towns in the regional development process. (250 words)

Research Gate

Why this question:

Question aims to evaluate the role of small towns in the regional development process.

Key demand of the question:

One has to explain that the regional development process is crucial for development of underdeveloped regions. This can be aided by the presence of small towns.

Directive:

Examine – When asked to ‘Examine’, we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Define what constitute small towns.

Body:

Discuss the functions that the small towns play with regards to the regional development process; They act as the link between larger urban centres in the urban hierarchy with the villages in the region. They provide socio-economic opportunities to the emerging middle class working age population; act as centres for counter-migration etc.

Then explain the limitations they face, discuss policies aimed to address these limitations.

Conclusion:

Conclude with way forward.

Introduction:

Small and intermediate size towns play a significant role in the socio-economic transformation of regional spaces through diffusion of innovations. It, however, has been hypothesized here that in this diffusion process the villages having better infrastructural facilities and services, play central role

Body:

‘small town’ is some place where urbanity has not yet reached in its full vigour. It may also sound relatively smaller in size by area and also by population residing within it. But the concept is not fully clear simply by its demographic status or by its areal occupancy.

Importance of role of small towns in regional development process:

- **By acting as centres of demand/markets for agricultural produce from the rural region**, either for local consumers or as links to national and export markets. Access to markets is a prerequisite to increase rural agricultural incomes, and the proximity of local small and intermediate centres to production areas is assumed to be a key factor.
- **By acting as centres for the production and distribution of goods and services to their rural region**. Such concentration is assumed to reduce costs and improve access to a variety of services, both public and private and for both rural households and enterprises. Hence, services include agricultural extension, health and education (and access to other government services), as well as banking, post, services of professionals such as lawyers and accountants, lower-order services such as bars and restaurants, and wholesale and retail sales of manufactured goods from within and outside the region.

- **By becoming centres for the growth and consolidation of rural non-farm activities and employment**, through the development of small and medium-sized enterprises or through the relocation of branches of large private or parastatal enterprises.
- **By attracting rural migrants from the surrounding region** through demand for non-farm labour, and thereby decreasing pressure on larger urban centres.
- **By managing natural resources** in ways that respond to the needs of growing rural and urban populations with special attention to protecting resources in the face of local and global environmental change.
- Small towns occupy an important position in the **urban-rural continuum** of India.
- Small towns possess a **unique binomial status of acting as a bridge between villages and cities**.
- They provide to villages 'a sort of resort' activity during their off-period from agricultural operations.
- In the developing world, small towns are neither traditional in their structure, nor do they represent modern settlement milieu. But they are empowered functionally by both the city and the country.
- Small towns have a unique way of life governed by their size, site, demography, social ecology and economy.
- Unlike villages, small towns are bigger, have better links with their surrounding countryside but are having weaker community affairs and social set-up.
- Small towns are instruments of stabilizing the balance of the urban process by their being reagents in symbiotic relationship between the lowest and uppermost settlement system.

However, there are challenges related to small towns:

- Unfortunately, despite the significant contribution of these small towns, they remain invisible in the policy discourse.
- The fact that they continue to be administered as rural villages also means that they are not on the priority of state and central governments as far as urban infrastructure is concerned.
- In any case, it is well known that an overwhelming amount of our total expenditure in urban infrastructure is cornered by large projects of urban transportation and infrastructure in metropolitan areas.
- But they also receive lower priority in provision of electricity, communication and financial services such as banking and credit.
- The invisibility of small towns in the political discourse is partly a result of the size of these towns but also the approach of the government.
- Rural areas continue to remain important politically because of the sheer size of rural areas as vote banks but also the nature of vulnerability that rural populations face.
- The absence of an administrative structure suited to urban governance eludes them since they are counted as rural in the administrative scheme of the government.
- The 'neither here, nor there' status of these census towns and small towns raises important questions of sustainability of these as drivers of growth.

Measures needed:

- The solution is not just changing our understanding of urbanization based on statistical measures but an economic classification.
- But more important is to recognize the importance of changing economic geography which is centred on these small towns and census towns.

- This will require not just planning ahead in terms of public provisioning of essential services and infrastructure to these areas but also making sure they continue to remain important for future growth.

Conclusion:

Thus, small towns are not just important for employment creation for the new entrants to the labour force but also a majority of those who will move out of agriculture in the future.

Case study:

A recent study by Urmila Chatterjee, Rinku Murgai and Martin Rama from the World Bank suggests that small towns have contributed significantly more in generating non-farm employment as compared to large cities. Another study by John Gibson, Gaurav Datt, Rinku Murgai and Martin Ravallion also highlights the importance of small towns in rural poverty alleviation compared to large cities.

In what way small entrepreneurs can prove to be a key to India's urban future, job creation, and growth revival of the economy? Analyse.(250 words)

Financial Express

Why this question:

The article highlights the growth dynamics of the formal and informal sectors and in that it explains the vital role that small entrepreneurs can play in reviving the growth story of the Indian economy.

Key demand of the question:

Discuss in detail the possible contributions that small entrepreneurs can make to the economy.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

First discuss who small entrepreneurs are.

Body:

Discuss first the existing Trends in urbanization and formalization of the Indian economy.

Comment on the importance of recognising the role of informal sector as an important driver of growth and job creation.

Quote relevant example if any.

Discuss what aspects foster the coming of small entrepreneurs and in what way they can largely contribute to the economy.

Explain challenges if any involved.

Conclusion:

Conclude that our mindset lets large enterprises have a disproportionate influence in policy making, with no place for the informal sector at the table. But India's urban future, job creation, and growth revival may be with the small entrepreneurs.

Introduction:

India's informal manufacturing sector is large, no matter which definition we use, enterprise or employment. A vast majority of India's workforce is informally employed – those who work outside of formal establishments, in un-incorporated private enterprises and mostly without any social security benefit.

Body:

Potential of India's MSME sector:

Telegram: <https://t.me/insightsIAStips>

Youtube: <https://www.youtube.com/channel/UCpoccbCX9GEIwaile4HLjwA>

Facebook: <https://www.facebook.com/insightsonindia>

- **Contribution to GDP:** The share of MSMEs in the **country's gross value added is estimated to be about 32%.**
- **Leveraging Exports:** It also contributes about **40% to total exports and 45% to manufacturing output.**
- **Employment Opportunities:** It employs 60 million people, creates 1.3 million jobs every year and produces more than 8000 quality products for the Indian and international markets.
- **Diversity:** There are approximately 30 million MSME Units in India and is quite diverse in terms of its size, level of technology employed, range of products and services provided and target markets.
- **Fostering Inclusive Growth:** MSME is constructing inclusive growth in numerous ways through promoting non- agricultural livelihood at least cost, unbiased regional development, large female participation, and providing a protection against deflation.

The challenges and concerns associated with the growth of Informal sector:

- **Access to Credit:**
 - According to Economic Survey (2017-18), MSME sector faces a major problem in terms of getting adequate credit for expansion of business activities.
 - The Survey had pointed out that the MSME received only 17.4 per cent of the total credit outstanding.
 - Most banks are reluctant to lend to MSMEs because from the perspective of bankers, inexperience of these enterprises, poor financials, lack of collaterals and infrastructure.
- **Poor Infrastructure:**
 - With poor infrastructure, MSMEs' production capacity is very low while production cost is very high.
- **Access to modern Technology:**
 - The lack of technological know-how and financial constraints limits the access to modern technology and consequently the technological adoption remains low.
- **Access to markets:**
 - MSMEs have poor access to markets. Their advertisement and sales promotion are comparatively weaker than that of the multinational companies and other big companies.
 - The ineffective advertisement and poor marketing channels makes it difficult for them to compete with large companies.
- **Legal hurdles:**
 - Getting statutory clearances related to power, environment, labour are major hurdles.
 - Laws related to the all aspects of manufacturing and service concern are very complex and compliance with these laws are difficult.
- **Government policies:**

- While the goal of Goods and Service Tax reform is commendable, its hasty implementation has adversely impacted small entrepreneurs in the informal sector. It has broken the link between formal and informal sectors.
 - Large enterprises that outsource a lot of tasks to small enterprises are now less inclined to outsource it to the informal sector that barely come under the GST net.
 - There is rising concern that demonetisation has also adversely impacted the informal sector more than the formal sector. Hundreds of millions of small enterprises that operate in the informal sector, and which are cash dependent, have suffered losses and lost their jobs.
 - Insolvency and bankruptcy reforms are important and needed for more efficient resource allocation. But it is not of a great consequence to the informal sector. There is mounting evidence that economic shocks that worsen infrastructure affect informal sectors by reducing their access to markets and basic services.
- **Lack of skilled manpower:**
- The training and development programs in respect of MSME'S development has been. Thus, there has been a constant crunch of skilled manpower in MSMEs

Other issues:

- Low ICT usage.
- Low market penetration.
- Quality assurance/certification.
- IPR related issues.
- Quality assurance/certification.
- Standardization of products and proper marketing channels to penetrate new markets.

Measures needed:

- Government of India and banks should design plans and measures to widen easy, hassle-free access to credit.
- The RBI should bring stringent norms for Non-Performing Assets (NPA) and it will help curbing loan defaulters and motivate potential good debts. Further, according to critics, the Credit Guarantee Scheme for MSME (CGTMSE) run by SIDBI is a growing contingent liability and needs to be examined with urgency
- Government should provide enhanced development and upgradation of existing rail & road network and other infrastructure facilities in less developed and rural areas to boost growth and development of MSMEs
- There should proper research and development in respect of innovative method of production and service rendering. Further, the government should promote and subsidise the technical know-how to Micro and small enterprises.
- Government should encourage procurement programme, credit and performance ratings and extensive marketing support to revive the growth of sick units.
- Skill development and imparting training to MSME workers is a crucial step to increase the productivity of the sector. The government should emphasise predominantly on skill development and training programs

Way forward:

- India's favorable structural trends and young demographics will revive growth, with urbanisation and informal sector playing a key role in job creation.
- The finance minister could explicitly recognise the role of informal sector as an important driver of growth and job creation in the next Budget.
- While the agenda on smart cities has caught the attention of policy makers, it needs to be made more inclusionary by integrating the informal sector into city planning, budgeting and financing. Technological revolution has made the informal sector as partners in development.
- Smartphones have become the key tool for women entrepreneurs, putting instant information about safety alerts, traffic, tourism, health services, and community news into millions of hands. India's urban future is in the informal sector.

Investments in the infrastructure sector in different ways can transmit into numerous effects leading to better growth of the Indian economy and inclusive employment generation. Discuss.(250 words)

[Financial Express](#)

Why this question:

The article highlights the significance of investments in the infrastructure sector of the country and in what way it in turn boosts the economy in several different ways.

Key demand of the question:

Discuss from the article relevantly, points that justify significance of investments in infrastructure. Relate in what way it augments the employment generation capacity in the economy.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Discuss what all constitutes infrastructure and how it drives other sectors of the economy.

Body:

Explain that Infrastructure is a crucial driver of economic growth. Infrastructure development not only creates employment but also has the capacity to increase consumption and can give a boost to the economy.

Discuss some gaps that are prevalently being witnessed in the infra sector.

Suggest means and ways to handle such issues.

Discuss the efforts taken by the government in this direction.

Conclusion:

Conclude with importance of investments and their relevance to the overall growth of the economy.

Introduction

Infrastructure enables trade, powers businesses, connects workers to their jobs, creates opportunities for struggling communities and protects the nation from an increasingly unpredictable natural environment. From private investment in telecommunication systems, broadband networks, freight railroads, energy projects and pipelines, to publicly spending on transportation, water, buildings and parks, infrastructure is the backbone of a healthy economy.

Body

- **Infrastructure investment leading to better growth and employment**

The target of \$5 Trillion economy can be reached with robust infrastructure in India.

- **Employment Generation:** It supports workers, providing millions of jobs each year in construction and maintenance. A **Brookings Institution** analysis Bureau of Labor Statistics data reveals that 14 million people have jobs in fields directly related to infrastructure.
 - Infrastructure development helps in **poverty reduction** due to its high employment elasticity leading to huge job creation capabilities.
- **Transport:** It has the **trickle-down effect** as better transportation infrastructure can lead to access to education, health, market and other basic necessities.
 - **Eg:** Transport is a burning component of **post-harvest crop management**. Especially for perishables.
 - India's most populous state Uttar Pradesh has only **one PHC for 28 villages** on average. Having goods transport in these cases is vital for healthcare.
 - Government's **Gram Sadak Yojana and Aajeevika Express** can prove to be a game changer for rural economies.
- **Increasing the manufacturing growth** as there is better connectivity, easier movement of goods and services, facilitating private investments
- **It reduces the regional and inter-state disparities** and leads to a balanced economic growth by regional equality.
- **Ease of Doing Business** will be improved especially if products can be transported faster with minimum delay. **Eg: Express freight, Inland waterways and hinterland to port connectivity for exports.**
- Infrastructure sector **has huge spill-over effects** on other sectors of economy. It **has money-multiplier** effect too.
- **Better quantity and quality of infrastructure** can directly raise the **productivity of human and physical capital** and in turn growth of nation
- **Climate change and disaster resilience:** There is a clear need for ensuring that all new and existing infrastructure systems are climate and disaster resilient
- **Government Efforts:**
 - With Initiatives such as 'Housing for All' and 'Smart Cities,' the government is working on reducing the bottlenecks that impede growth in the infrastructure sector.
 - Under UDAY scheme the government has taken steps to improve operational and financial parameters of discoms.
 - The National Highways Authority of India (NHAI) launched Masala Bonds in May 2017, for raising capital for funding the infrastructure projects in India.
 - National Infrastructure Investment Fund (NIIF) with an initial corpus of Rs 40,000 crore.
 - The modernization of Indian Railways has been one of the top priorities of the central government
 - The **Bharatmala Pariyojana** is unique and unprecedented in terms of its size and design, as is the idea of **developing ports as engines of growth under Sagarmala**.

In lieu of above benefits, Government recently announced the National Infrastructure Pipeline (NIP) investing nearly Rs. 102 lakh crore in the next five years.

Conclusion

Infrastructure is a key driver of the overall development of Indian economy. It is seen that investments in infrastructure equal to 1% of GDP will result in GDP growth of at least 2% as

infrastructure has a “multiplier effect” on economic growth across sectors. The recent headway made in developing transport infrastructure will prove to be the biggest enabler for growth. An efficient infrastructure can provide avenues for employment through trickle-down effect. India’s growth story should no longer be impeded by a lack of infrastructure, and the fruits of this growth should reach everyone in the remotest part of the country.

Private banks were the slowest to pass on the benefits of falling interest rates to their customers last year compared to their state-run and foreign rivals. Discuss in detail the underlying causes of for private banks not passing on the benefits of interest rate cuts to its customers compared to other banks. (250 words)

[Live Mint](#)

Why this question:

Discuss the issues of private banks not transmitting benefits of interest rates to the customers.

Key demand of the question:

Explain the issue in detail and highlight the impact of the problem while suggesting solutions to the issue.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

First discuss who small entrepreneurs are.

Body:

Discuss that the process of setting interest rates by banks is at the core of transmission and the central bank has for several years been trying to make it more transparent. This has led to the change from benchmark prime lending rate

(BPLR) to base rate to MCLR and finally to external benchmark-based lending rates.

Explain what does the RBI data show?

The median one-year marginal cost of funds-based lending rate (MCLR) for private banks fell a meager 12 basis points (bps) to 9.18% between January and December 2019, compared to RBI’s cumulative 135 bps cut in its key policy rate to 5.15%. Most bank loans are typically priced over the one-year MCLR, making it the most tracked rate.

In the same state-run banks have lowered their one-year median MCLR by 45 bps and foreign banks have cut their lending rates by 75 bps.

Foreign banks have the lowest median one-year MCLR rate at 7.9% as of December. Their public counterparts are at 8.3%. For all scheduled commercial banks taken together, the one-year median rate stands at 8.3%.

Suggest solutions to address the issue.

Conclusion:

Conclude with what needs to be done.

Introduction:

Private banks were the slowest to pass on the benefits of falling interest rates to their customers in 2019 compared to their state-run and foreign rivals, Reserve Bank of India (RBI) data showed. The median one-year marginal cost of funds-based lending rate (MCLR) for private banks fell a meagre 12 basis points (bps) to 9.18% between January and December 2019, compared to RBI’s cumulative 135 bps cut in its key policy rate to 5.15%.

Body:

Rate cuts in State run banks vis-à-vis private banks:

- Undoubtedly, there has been a reduction in lending rates for both private and public sector banks if you look at the data on weighted average lending rate published by RBI
- state-run banks have lowered their one-year median MCLR by 45 bps and foreign banks have cut their lending rates by 75 bps.
- Foreign banks have the lowest median one-year MCLR rate at 7.9% as of December.
- Their public counterparts are at 8.3%. For all scheduled commercial banks taken together, the one-year median rate stands at 8.3%.
- However, the trend in the median lending rates of private banks as a category is somewhat different from the trend in weighted average lending rates because the reduction in the cost of funds for larger and stronger private banks has been higher.
- Therefore, the lending rate reduction for them has been higher as compared to some of the smaller private banks

Reasons for private banks not passing on the benefits of interest rate cuts to its customers compared to other banks:

- The reason private banks are less eager to cut interest rates lies in their cost of funds.
- They pay the highest interest to their depositors.
- Private lenders are followed by public sector and foreign banks, respectively.
- While private banks paid depositors 6.91% interest in November 2019 (latest data), public sector banks paid 6.65% and foreign banks 5.38%, according to RBI data on weighted average deposit rates.

Way forward:

- Enabling effective monetary transmission would not only increase the credibility of the Central Bank but also help in strengthening the financial structure.
- Impounding of bank money by RBI is too high with 4% cash reserve ratio carrying no return whatsoever.
- To make transmission work, the least the RBI can do is to reduce CRR.
- Timely transmission of policy rates could be considerably improved if the banking sector's non-performing assets (NPAs) are resolved more quickly and efficiently.
- If the government wants to reduce lending rates, it could focus on bringing down its own fiscal deficit and public sector borrowing.

- At the current low levels of per capita income, the savers are far more risk-averse in India and unwilling to invest in higher-risk instruments other than bank deposits.
- For a repo-linked regime to work, the whole banking system in India would have to shift to that.
- In other words, along with banks' lending rates, their deposit rates too must go up and down with the repo.

Besides Ujwal DISCOM Assurance Yojana (UDAY) fading to engineer a reversal in DISCOM finances, government needs to revise incentive structures. Critically analyse the statement. (250 words)

Indian Express

Why this question:

Almost five years after the launch of the Ujwal DISCOM Assurance Yojana (UDAY), there are indications that the power sector is once again in trouble. The article traces the performance of the scheme so far and brings out detailed deliberation of DISCOM finances.

Key demand of the question:

Discuss the issues of power sector in India in general and specifically with respect to the financial concerns of state DISCOMs. Highlight the need for efforts by the government in different perspectives.

Directive:

Critically analyse – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgment.

Structure of the answer:

Introduction:

Briefly highlight the issue.

Body:

In the recent past, several initiatives have been taken to address the challenges in the power sector. These include structural changes in the regulatory framework as proposed by the Electricity (Amendment) Bill, 2014, and more recently, the UDAY scheme to address financial issues being faced by companies distributing electricity.

Discuss what challenges are posed by the DISCOMs, why have the restructuring policies failed in the past.

Suggest what government should do to address these constraints.

Conclusion:

Conclude that a multi-pronged approach is the need of the hour.

Introduction:

Ujwal DISCOM Assurance Yojana (UDAY) is a financial restructuring and efficiency enhancing program, aims to reduce the debt burden of the state owned electricity distribution companies (DISCOMs) started in 2015. Though the main component of UDAY is debt management, other measures like raising operational efficiency are also proposed to permanently settle the debt scenario of DISCOMs. Almost five years after the launch of the Ujwal DISCOM Assurance Yojana (UDAY), there are indications that the power sector is once again in trouble.

Body:

The UDAY scheme, which involved state governments taking over the debt of discoms, had three critical components: A reduction in the aggregate technical and commercial (AT&C) losses, timely revision of tariffs, and elimination of the gap between average per unit of cost and revenue realised.

**Success of UDAY scheme:**

- It took off well, with a large number of states joining the scheme. Several states took over the debt of their utilities, improving their liquidity situation. Anecdotal evidence also suggests an improvement in the power supply situation.
- Government's UDAY scheme has helped debt-laden discoms of 24 states to reduce losses to Rs 369 billion in 2016-17 from Rs 515.9 billion in the previous financial year.
- The participating states have achieved an improvement of one per cent in Aggregate Technical & Commercial (AT&C or distribution) losses and Rs 0.17 a Unit in the gap between Average Cost of Supply and Average Revenue realised in 2016- 17
- AT&C losses have declined in some states, but not to the extent envisaged. Under UDAY, discoms were to bring down AT&C losses to 15 per cent by FY19.

Limitations of UDAY scheme:

- Not only have losses of state-owned distribution companies (discoms) risen, but their dues for power purchases have also surged.
- At the end of November 2019, dues owed by discoms to power producers, both independent and state-run entities, stood at Rs 80,930 crore.
- Of these, Rs 71,673 crore extends beyond the allowed grace period of 60 days. Rajasthan leads the states with the most dues, followed by Tamil Nadu and Uttar Pradesh.
- While some states have raised power tariffs, the hikes have not been sufficient as political considerations prevailed over commercial decisions.
- As a result, the gap between the average cost per unit of power and the revenue realised has not declined in the manner envisaged, forcing discoms to reduce their power purchases and delay payments to power producers.
- This in turn has impaired the ability of power generating companies to service their debt, causing stress to the banking sector.
- There is no guarantee that there will not be future losses as there is no retribution if the State electricity boards choose not to reform. In fact, this has been kept out of the purview of the scheme.
- By also mandating that State governments have to progressively take over the losses of their SEBs, the Centre has put the onus on the States to deal with the problem

Measures needed:

- Discom business needs to be fundamentally restructured.
- Governance needs to be improved with greater resilience to political influence.
- Robust mechanisms need to be put in place to ensure tariff rationalisation and follow-through on subsequent increases.
- Market-friendly electricity reforms need to be introduced and enforced. This includes expanding the role of short-term markets, as well as strict enforcement of PPAs to assure investors and developers of the legal sanctity of contracts signed with discoms.
- Streamlining the open access process, with the fair application of additional surcharges will boost the demand for renewable energy from the commercial and industrial sectors.
- Discoms will have to be pushed harder to invest in technical solutions and infrastructure upgrade such as feeder separation, installing smart meters and undertaking detailed data collection and analysis.
- Strict Actions to curb Electricity theft and other actions those lead to Losses to DISCOMs.

- Integrating UDAY scheme with Make in India and Startup India to ensure overall Development.
- Integrating UDAY with KUSUM to increase amount of electricity to DISCOMS.

Conclusion:

The Centre should also look at altering the incentive structures of states in order to ensure compliance. Stiff penalties need to be imposed for not meeting the targets laid out in the new scheme.

Several doubts expressed over recent official statistics in the country, examine if the present national accounting and analytical framework misses out on many key dimensions of a complex economy. Suggest solutions.(250 words)

The Hindu

Why this question:

The article highlights the fact that Reliable and trustworthy data models could improve our chances of improving our economy, amidst several doubts expressed over recent official statistics in the country.

Key demand of the question:

Discuss in detail the recent issues that have been continuously pointed out at the inefficiencies and loopholes in the statistical data. And suggest what needs to be done.

Directive:

Examine – When asked to ‘Examine’, we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

First discuss what the issue is around the statistical data of the country.

Body:

Highlight first the facts where doubts were expressed over statistical data like the – Base year for GDP estimation, Employment-unemployment data being withheld etc.

Then move onto discuss the importance of statistical data in general.

Explain what are the major concerns over data

Suggest way forward as to what can be done to resolve the issue.

Conclusion:

Conclude that newer solutions should be explored and the country needs to Build more reliance and trust on public data.

Introduction:

The new series of Gross Domestic Product (GDP) figures with 2011-12 as base, released in 2015, has not gone well with analysts; the withholding of employment-unemployment data for some time and consumer expenditure data, which is not released, added to this unease. Bringing the National Sample Survey Office (NSSO) under the fold of National Statistics Office, altering its long-standing arrangement under the Governing Council and then National Statistical Commission, triggered suspicion.

Body:

Doubts raised:

- There are fears that the merger is an attempt to make the NSC toothless and officially defunct.
- The present series encountered serious problems for the price adjustment, specifically for the services sector contributing about 60% of GDP, in the absence of appropriate price indices for most service sectors.
- Defunct enterprises in MCA-21: The report based on a field survey of services firms showed that 16.4% of companies in the MCA-21 database were either non-traceable or closed, and another 21.4% were 'out of coverage' or misclassified.
- Insufficiency in ASI data: ASI underestimates manufacturing growth in the GDP by up to one percentage point as about half the manufacturing companies registered under the Companies Act were not in the ASI list.
- Pricing series issue with the service sector: The present series encountered serious problems for the price adjustment, specifically for the services sector contributing about 60% of GDP.
- Absence of price index: There is an absence of appropriate price indices for most service sectors.
- Unchanged approach: price and production indices are constructed using a fixed base Laspeyres Index, yield rate for paddy is estimated by crop cutting experiments, and the organization of field surveys for collection of data on employment-unemployment, consumer expenditure, industrial output, assets, and liabilities continue.
- Productivity and remunerative price of output are major concerns for agriculture.
- The growing inequality and concentration of wealth: Monopoly power, inefficient input-output mix, dumping, obsolete technology, and production mix
- Ignoring structural issues: The macroeconomic framework assumes symmetric income distribution as it focuses on a trend-cycle decomposition of GDP for growth and a trickledown effect for percolation of income

Measures needed:

- We need a new framework for analysis for such a complex system and evolutionary process.

- There is a question of growing market power, automation, robotisation and other labour-replacing technologies affecting profitability, structural change and general welfare.
- We need to find alternative avenues for the unemployed and jobs lost.
- We also need to know in greater detail about market microstructure and optimality therein, the role of technology and advanced research, changing demand on human skills, and enterprise and organising ability, which are all complex.
- The consensus macroeconomic framework of analysis assumes symmetric income distribution, and does not get into the depth of structural issues, as it focuses on a trend-cycle decomposition of GDP for growth and stability in market parlance and a trickle-down effect for percolation of income.
- In order to inject efficiency and stability, we need to have detailed data on how: markets clear, prices are formed, risks build up, institutions function and, in turn, influence the lifestyle of various sections of the people.
- The alternative to be realistic for the real world must rest on two pillars: the micro-behaviour of individuals, and the structure of their mutual interactions.
- In the changed situation of availability of micro data, we need to build a system to integrate the micro with the macro, maintaining distributional characteristics.

Way forward:

- As official statistics is a public good, giving information about the state of the economy and success of governance, it needs to be independent to be impartial.
- Data is the new oil in the modern networked economy in pursuit of socio-economic development.
- The economics now is deeply rooted in data, measuring and impacting competitiveness, risks, opportunities and social welfare in an integrated manner, going much beyond macroeconomics.
- We have a commitment to produce these statistics transparently, following internationally accepted standards, tailor-made to suit local conditions, for multi-disciplinary analytics.
- As these statistics reflect on the performance of the government, it is necessary that its independence is maintained scrupulously.
- To pursue the goal of a \$5-trillion economy by 2024-25, harnessing demographic dividend, we must tap underused resources for demand creating investment, which require data to pursue policy right from a district and evaluate performance for efficiency including governance.

Improving air quality in the cities requires a transformative planning approach guided by the singular objective of reducing the use of polluting vehicles. In the light of the statement above discuss and analyse the significance of India switching to new emission standards in the coming days. (250 words)

Reference: [You Tube](#)

Why this question:

The question is in the backdrop of the fact that BS 6 will be the new emission standard that all vehicles in the country will have to adhere to from April 1, 2020. Thus the question.

Key demand of the question:

Discuss the context of the question in detail and explain in what way such transformative planning approach is the need of the hour to overcome the challenge of Pollution in the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Briefly highlight the shift from BS IV to BS VI.

Body:

Discuss the current conditions of pollution in the Indian cities.

Explain why is it important to upgrade these norms?

Upgrading to stricter fuel standards helps tackle air pollution.

Global automakers are betting big on India as vehicle penetration is still low here, when compared to developed countries.

At the same time, cities such as Delhi are already being listed among those with the poorest air quality in the world. The national capital's recent odd-even car experiment and judicial activism against the registration of big diesel cars shows that governments can no longer afford to relax on this front.

Discuss what steps are to be taken to address the challenges.

Conclusion:

Conclude that outcome of such policies should be welcomed for the positive impact it will have on air quality and public health and more of such approaches should be taken up in future.

Introduction:

According to the findings, India is home to seven of the 10 most polluted cities in the world, going by air-quality numbers recorded last year. Gurugram and Ghaziabad are the most polluted, while Delhi is the worst off among capital cities. ICMR estimates reveal that one in every eight deaths in India is attributable to air pollution, which now contributes to more disease burden than smoking.

Body:

BS 6:

BS 6 is the new emission standard that all vehicles in the country will have to adhere to from April 1, 2020. The sale of BS-4 vehicles will also cease from this day. The Supreme Court had ruled on October 24 2019 that no BS-4 vehicle would be sold with effect from April 1, 2020. Bharat Stage Emission Standards are emission regulations implemented by the government to keep a check on emissions from motor vehicles.

- To start with, the 'BS' in BS VI stands for 'Bharat Stage' which signifies the emission regulation standards set by Indian regulatory bodies.
- The 'VI' is a roman numeric representation for six (6). The higher the number gets, the stricter the Bharat Stage emission norms get which eventually means it becomes trickier (and costlier) for automakers to meet them.
- These emission standards were set by the central government to keep a check on the pollutant levels emitted by vehicles that use combustion engines. To bring them into force, the Central Pollution Control Board sets timelines and standards which have to be followed by automakers.
- Also, the BS norms are based on European emission norms which, for example, are referred to in a similar manner like 'Euro 4' and 'Euro 6'. These norms are followed largely by all automakers across the globe and act as a good reference point as to how much does a vehicle pollute.

- To wrap it up and put it simply, Bharat Stage emission norms are largely similar to the European emission norms followed globally.

Difference between BS-IV and the new BS-VI:

- The major difference in standards between the existing BS-IV and the new BS-VI auto fuel norms is the presence of sulphur.
- The newly introduced fuel is estimated to reduce the amount of sulphur released by 80%, from 50 parts per million to 10 ppm
- As per the analysts, the emission of NOx (nitrogen oxides) from diesel cars is also expected to reduce by nearly 70% and 25% from cars with petrol engines.

Importance of upgrade these norms:

- Upgrading to stricter fuel standards helps tackle air pollution.
- Global automakers are betting big on India as vehicle penetration is still low here, when compared to developed countries.
- At the same time, cities such as Delhi are already being listed among those with the poorest air quality in the world. The national capital's recent odd-even car experiment and judicial activism against the registration of big diesel cars shows that governments can no longer afford to relax on this front.
- With other developing countries such as China having already upgraded to the equivalent of Euro V emission norms a while ago, India has been lagging behind. The experience of countries such as China and Malaysia shows that poor air quality can be bad for business. Therefore, these reforms can put India ahead in the race for investments too.

Will the vehicles with BS-VI tech become expensive?

- The everyday customer who is yet to buy themselves a vehicle or is planning to get one could soon have to shell out more for their purchase.
- On top of that, the fuel costs also need to be taken into account. But above all of this, there is a bigger target to be achieved. India has some of the most polluted cities in the world and automobiles are often considered as one of the biggest factors responsible for it.
- The need of the hour is to control the pollution levels by all means possible and since globally, countries are implying Euro 6 levels of emission regulations, India needs to step up its game and hence the BS IV to BS VI emission norm implication.

What needs to be done?

- Although the BS-4 car can run on BS-6 Fuel, but what will happen if we defer our purchase
- Emission: Cleaner fuel as the sulphur levels will be lower and lower PF (Particulate Filter). Thus, the emissions will be relatively much lower than what emit by cars.
- Also, our BS-6 Car will get latest Technology and updates including changes in Catalytic, Diesel Particulate Filter, and Fuel Injection for better compliance to Emission. Care for Environment – you should defer your purchase call
- Engine Performance: The Sulphur levels will be lower, thus acids as formed will be lower and also the engine oil life will improve.
- Even the fuel would be much cleaner and thus care for better efficiency from our car in terms of improved Engine Oil Life, Engine Performance, Engine NVH Levels you will get all these benefits with BS-6 Fuel

- Fuel Efficiency: Been the fuel in BS-6 regime would be much cleaner – the overall fuel efficiency can also jump in when used a BS-6 compliant car using BS-6 Fuel grade.
- Safety Features: ABS, Airbags would be standard all across model Variants as sold from 2020. Even crash test regulations would be improved.
- It involves Selective Catalytic Reduction (SCR), which is an advanced active emissions control technology.
- SCR converts nitrogen oxides to nitrogen, water, tiny amounts of CO₂ by pumping in automotive grade liquid urea, which is known as Diesel Exhaust Fluid (DEF).
- It achieves NO_x reductions up to 90%. Tailpipe Particulate Matter filter is used.
- This reduces the Particulate Matter coming out of the vehicle to the required level.

Conclusion:

This outcome should be welcomed for the positive impact it will have on air quality and public health. At every stage, the technology is increasingly more complex. To attain the specified super low emissions, all reactions have to be precise, and controlled by microprocessors. Improving air quality in the cities requires a transformative planning approach guided by the singular objective of reducing the use of polluting vehicles.

Inclusive growth and issues arising from it

“Digital literacy is integral for financial inclusion.” Comment in the background of India’s efforts to expand access to organized financial systems through digital payments (250 words)

[The Hindu](#)

Why this question:

The article emphasizes on the fact that Access to Internet must be recognized as a fundamental right to free speech, basic freedoms and the right to life. Thus the context of the question.

Key demand of the question:

Deliberate in detail as to how Digital literacy is integral for financial inclusion. Also highlight the country’s efforts in augmenting the digitization process of the economy.

Directive:

Comment– here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

Explain what you understand by digital literacy.

Body:

Focus the spurt in digital infrastructure.

Explain how digital literacy is crucial for financial inclusion.

Discuss the importance of financial inclusion for the inclusive growth of the society.

The recent growth in digital banking infrastructure could foster a cultural shift in the intensity of use of electronic modes of payments and settlement. Its adoption even in the hinterlands with the active use of business correspondents is encouraging.

Discuss concerns and challenges involved if any.

Conclusion:

Conclude with policies and measures taken by the government in this direction.

Introduction:

Digital literacy refers to the wide range of skills, which are necessary to emerge successful and adapt to the digital world. Since the print mediums are facing stagnation, the ability to grasp information found online becomes important. People and students who lack digital literacy skills may soon find themselves tough to gain access to information which is available online.

Recently, the Kerala High Court, in **Faheema Shirin v. the State of Kerala** case, declared the **right to Internet access as a fundamental right** forming a part of the right to privacy and the right to education under Article 21 of the Constitution. The court held that, in an information society, unequal access to the Internet creates and reproduces socio-economic exclusions.

Body:

India's efforts to expand access to organized financial systems through digital payments:

- As a larger part of the RBI's policy to promote digital inclusion, making online remittances through **National Electronic Funds Transfer (NEFT) and Real Time Gross Settlement System (RTGS)** facilities in savings bank accounts free from January 2020 is indeed significant.
- **Forty-five wallet players, 50 UPI-based payments service providers and 142 banks** on the UPI platform are actively coordinating with each other to deliver services to customers.
- **Small finance banks (SFBs) and payments banks** have also been set up to improve outreach and to pursue FI, for the benefit of people at the bottom of the pyramid — migrant labour, village workforce, low-income households, small businesses and other unorganised sector entities.
- **Merchant discount rates** — the charges that merchants have to pay to banks on transactions done on debit/credit cards — were waived in the Union Budget presentation for 2019-20.
- Companies with a turnover of ₹50 crore or more are mandated to provide free facility of payment through Rupay debit cards and UPI QR codes to customers from January 2020, and a tax of 2 per cent will be levied on entities drawing cash of over ₹1 crore in one year.
- The number of **point of sales terminals increased from 12,11,890 in September 2015 to 45,89,727 by September 2019**, while the number of debit cards increased from 604 million to close to 835 million during the same period.

Reasons for the above success:

- Non-bank peer-to-peer lenders and the introduction of a new type of prepaid payment instruments will go a long way in deepening FI through further digital penetration.
- Enhancing access to financial touch points and reducing the cost of access have been the twin drivers of digital inclusion.
- Moving beyond just setting up full-fledged bank branches, banks have started expanding the base of alternate electronic delivery channels at a much faster pace, after mobile connectivity and network, and Internet services were made accessible and affordable to people at the bottom of the pyramid.

Limitations/challenges present:

- The formidable challenge is the **increased inoperative bank** accounts that limit the merits of FI.
- The World Bank estimates indicate that **47 per cent of such accounts are inoperative and 23 per cent of PMJDY accounts remain dormant**. The gap in imparting financial and digital literacy is evident.
- **Tackling inoperative accounts and deepening FI efforts** to realise its actual potentiality to contribute to economic the wellbeing of the society remains a formidable challenge.

- **Inadequate institutional efforts** to disseminate financial awareness at the grassroots level are keeping even financially connected masses (those having bank accounts and debit cards) away from the formal financial system.
- While many stakeholders have been doing sporadic work, they are not coordinated enough to optimise its effectiveness.
- The missing link in FI is now obviously the **lack of financial and digital knowledge of massive user base**.

Way forward:

- In order to make FI work to ensure that the benefits of inclusion reaches the intended target group of the society, seminal changes need to be introduced in the spread of financial and digital literacy and credit counselling.
- Adequately equipping and empowering institutions engaged in disseminating comprehensive literacy programmes will be essential to unleash the potentiality of the huge financial and digital infrastructure built and designed to sub serve FI.
- It is the right time to accelerate literacy campaigns, particularly when digital culture is spreading fast with introduction of the GST, FASTags and other online utilities of daily use.
- Right synchronisation of comprehensive literacy efforts with the evolving payment and settlement ecosystem should be able to take India close to the end-state objectives of FI by 2030, by when the sustainable goals of UN are to be achieved.

Conclusion:

We are living in an 'information society'. Unequal access to the Internet creates and reproduces socioeconomic exclusions. It is important to recognise the right to Internet access and digital literacy to alleviate this situation, and allow citizens increased access to information, services, and the creation of better livelihood opportunities

Considering the fact that Internet broadband and mobile Internet services have become an integral part of the life of the people, Do you agree that it is time to recognize that the right to access the Internet which is indeed a fundamental right within our constitutional guarantees? Analyse. (250 words)

[The Hindu](#)

Why this question:

The article debates upon the need to recognize right to internet as the fundamental right.

Key demand of the question:

Discuss the importance of Internet and access to it as equivalent to right to life and right to equality thus qualifying it as an integral fundamental right.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Internet broadband and mobile Internet services are a lifeline to people in India from all walks of life.

Body:

Discuss the significance of Internet in today's world – People working in the technology-based gig economy — like the thousands of delivery workers for Swiggy, Dunzo and Amazon and the cab drivers of Uber and Ola — depend on the Internet for their livelihoods. It is a mode of access to

education for students who do courses and take exams online. Access to the Internet is important to facilitate the promotion and enjoyment of the right to education.

Present a discussion of how right to access to the Internet can be rooted in Article 19 of the Universal Declaration of Human Rights.

Highlight the need to back internet access as right to life.

Discuss concerns if any and suggest way ahead.

Conclusion:

Conclude by reasserting significance of right to internet as a fundamental right.

Introduction:

Internet broadband and mobile Internet services are a lifeline to people in India from all walks of life. While the Internet is certainly a main source of information and communication and access to social media, it is so much more than that. In Sep 2019, the Kerala High Court, in **Faheema Shirin v. the State of Kerala case**, declared the right to Internet access as a fundamental right forming a part of the right to privacy and the right to education under **Article 21 of the Constitution**. Despite this, according to the Software Freedom Law Centre data, there have been more than a 100 Internet shutdowns in different parts of India in 2019 alone.

Body:

Need for right for Internet:

Internet has become quite useful in our daily public life as well. It is quite hard to ignore the need, importance and the value of internet in our daily life. Though there are countless uses of Internet in society, we have listed out here a few benefits of Internet for society.

- **Online Banking:** In the world we live today, the role of Internet has tremendously grown. In the field of online banking, the advantages of internet are of pivotal importance. Earlier, there used to be manual banking work. It was quite difficult to handle banking and transaction online. Now, with the help of Internet it has been made quite easier to send and receive payments anywhere in the world. It has brought many positive economic impacts on our society.
- **Online Trade & E commerce:** E-commerce is gaining popularity across the world. It is only because of Internet that doing business has become quite easier. Online trade has changed the fortunes of millions of people across the world. It has revolutionized the social life.
- **Faster Connectivity:** Due to Internet, the connectivity has become much faster. The distances have disappeared. The world has become global. It is quite easy to connect with each other. The virtual world has made it possible for us to get in touch easily with each other. The world has become a global village where the knowledge, ideas, information and everything flows quite easily from one place to another. It has the great benefits for society.
- **Creation of More Jobs & More Income Opportunities:** In Old times, the economy used to be limited and isolated. But with the advent of Internet the industries and world economies have come closer to each other. Thanks to Internet, millions of new jobs are being created. The economic advantages of internet for society have been witnessed. Millions of People are changing their lives with the help of Internet. This is one of the greatest benefit of Internet for society.
- **Spread of Education and Awareness:** Internet has completely changed the system of education. Earlier there used to be the traditional and limited education system. Education has spread quickly via online learning. The online education system via internet has dramatically reduced

the cost of education. It has become easily accessible and affordable. With the help of online videos platforms, teaching models and multiple audio, video and visual study material, the education and awareness has been spreading very fast. It is again one of the greatest social benefit of Internet for our lives.

- **The Role of Artificial Intelligence:** Artificial Intelligence and machine learning has completely changed the scope and future of computer education. Artificial intelligence is proving quite beneficial for society. It is useful in every walk of life including in education, health, economy, trade, industry and in medial field. This great social benefit is again due to internet.
- **Role of Internet and Informational Technology in Medical and Health Field:** Thanks to modern technology of today we have the cures of these diseases easily available. The medical field has greatly progressed because of Internet connectivity and information technology.
- Internationally, the right to access to the Internet can be rooted in **Article 19 of the Universal Declaration of Human Rights** which states that “everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media and regardless of frontiers.”

However, there are associated concerns too of making internet a fundamental right:

- **Privacy Issues:** Privacy is the right of every individual. Unfortunately, in online world it has become quite hard rather impossible to safeguard one’s privacy. Our smart phones and various other internet services that we use, track down our movements.
- **Internet is merely a technology, nothing less but certainly nothing more.** For instance, technology indeed mattered for the Arab protests, but this did not make the Arab Spring a technological revolution. Social networks did not cause these movements, but they kept them alive and connected.
- The things that we call human rights must be among the things humans need in order to lead healthy, meaningful lives, like freedom from torture or freedom of conscience. The **Internet is valuable as a means to an end, but not as an end in itself.**
- Most modern human rights recognized come with some sort of enforcement mechanism, be it hard law (e.g. courts or compliance committees) or soft law (e.g. monitoring). Yet claims for the recognition of new fundamental rights should always be carefully examined. If they are rashly accepted, it could lead to a **practice of fragmentation and constant increase of human rights.**
- One can argue that the ‘visibility’ argument in favour of more human rights recognition does not take into account the flexibility of existing rights. Technological advances often change the way in which we exercise our rights and freedoms, and thus broaden the practical scope of these rights.

Conclusion:

The usefulness of the Internet cannot be overstated and the government should do everything possible to bridge the digital divide among its constituents. But declaring access to the Internet as a citizen’s right is not a defensible proposition.

Discuss in detail reasons for India to embrace Inclusive Growth.(250 words)

Indian economy by Dutta and Sundaram

Why this question:

The question is straightforward and is from the static portions of GS paper III.

Key demand of the question:

Discuss in detail the causes for which Indian setup necessitates inclusive growth.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define what you understand by Inclusive growth.

Body:

Discuss briefly the basic elements of Inclusive growth.

Move on to discuss the reasons for India to embrace inclusive growth.

The recognition of the significance of inclusive growth in developing Asia has been generated by a rising concern that the benefits of remarkable economic growth have not been equitably shared.

Inclusive growth is required for sustainable development and impartial distribution of wealth.

Discuss the challenges involved.

Conclusion:

Conclude with ways and means to achieve inclusive growth.

Introduction:

The concept of **inclusive growth focuses on equitable growth for all sections of society**. This involves ensuring that fruits of growth and development reach the poor and marginalized sections as well. Inclusiveness is a multi-dimensional concept. Inequalities that include, social exclusion, discrimination, restrictions on migration, constraints on human development, lack of access to finance and insurance, corruption – are sources of inequality and limit the prospect for economic advancement among certain segments of the population, thereby perpetuating poverty.

Body:

Reasons for India to embrace Inclusive Growth:

- India is the 7th major country by area and 2nd by population. It is the 12th largest economy at market exchange rate. Yet, development is not visible in India and it's the neighbourhood nation, i.e., China is progressing at speedy rate.
- The agenda for inclusive growth was envisaged in the Eleventh Plan document which intended to achieve not only faster growth but a growth process which ensures broad-based improvement in the quality of life of the people, especially the poor, SCs/STs, other backward castes (OBCs), minorities and women and which seeks to provide equality of opportunity to all.
- The exclusion in terms of low agriculture growth, low quality employment growth, low human development, rural-urban divides, gender and social qualities, and regional disparities etc. are the problems for the nation.
- Decreasing of poverty and other disparities and raising of economic growth are major objectives of the nation through inclusive growth.
- Political leadership in the country plays a vital role in the overall development of the country. But, the study has found that politicians in India have a very low level of scientific literacy.
- Studies assessed that the cost of corruption in India amounts to over 10% of GDP. Corruption is one of the ills that prevent inclusive growth.

- Though child labour has been banned by the law in India and there are stringent provisions to deter this inhuman practice. Still, many children in India are unaware of education as their lives are spoiled to labour work.
- Literacy levels have to rise to provide the skilled workforce required for higher growth.
- Economic improvements in the country are overwhelmed by out dated philosophies and allegations by the politicians and opposition parties in India.
- Achievement of 9% of GDP growth for country as a whole is one of the boosting factor which gives the importance to the Inclusive growth in India.
- Inclusiveness benchmarked against achievement of monitor-able targets related to
 - Income & Poverty
 - Education
 - Health
 - Women & children,
 - Infrastructure
 - Environment
- At global scale, there is a concern about dissimilarities and exclusion and now they are also taking about inclusive approach for development.
- It is estimated that about 80% of India's labour force works in the informal economy.
- Jobs in the informal economy are typically insecure, with neither employment contracts nor regular pay, and very often workers are engaged on a day-to-day basis.
- The working conditions in the informal economy therefore resemble a low-productivity trap.
- At the most basic level, economic growth results from labour force growth and productivity growth of workers.

Way forward:

- In a democratic country India, majority of population living in rural India and to bringing them into the mainstream is main concern.
- The best way to realise inclusive growth is through developing people's talents. It is said by government authorities that a multidimensional approach towards education and skills development is essential to achieve growth.
- To address this challenge, inclusive growth with its focus on creating economic opportunities and ensuring equal access to them will play a key role.
- The challenge of skills shortage can be addressed through public private partnership.
- Special efforts to increase employment opportunities are essential as it is a necessary condition for bringing about an improvement in the standard of living of the people

Conclusion:

More and more countries are accepting it as the goal of development policy. Inclusive growth as a development notion is also being comprised by many development partners of developing countries

including bilateral and multilateral aid agencies, international organizations, nongovernment organizations, and civil society.

Government Budgeting. Investment models.

Health is a critical sector for achieving overall equitable human development in the country. In the Indian setup the idea of Public Private Partnership can bridge the investment deficit and improve the efficiency and outreach of service delivery.

Explain. (250 words)

[Live Mint](#)

Why this question:

To address shortage of qualified doctors and bridge gap in medical education, the Niti Aayog has come out with the public-private partnership model to link new or existing private medical colleges with functional district hospital to augment medical seats.

Key demand of the question:

Discuss the significance of PPP in health sector to the case of Indian scenario.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms wherever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Define what PPP is. Then explain the context of the question.

Body:

Highlight the fact that India has a dire shortage of qualified doctors. It is practically not possible for the Central/state government to bridge the gaps in the medical education with their limited resources and finances.

Discuss the issues prevalent in Indian health sector.

Explain in what way PPP model can address the issue.

Conclusion:

Conclude with way forward.

Introduction:

India takes pride in the fact that it is one of the fastest-growing economies in the world. But our heads will hang in shame if we look at India's health system. To address shortage of qualified doctors and bridge gap in medical education, the Niti Aayog has come out with the public-private partnership model to link new or existing private medical colleges with functional district hospital to augment medical seats.

Body:

Public healthcare scenario in India:

- The government spends 1.02% of the GDP on health compared to the global spending of 6%.
- There is a shortfall of 20% sub-centres, 22% public health centres and 32% community health centres.
- The average population served by one public sector allopathic doctor is 11 times higher than the World Health Organization's recommendations.
- High out of pocket expenditure to the tune of 60%. The excessive reliance on OOP payments leads to financial barriers for the poorest, thereby perpetuating inequalities in health care.

- Clearly, India is struggling to serve its population amid the rising burden of diseases along with poor coverage by public health on the other.
- In addition to these challenges, the private sector is poorly regulated when it comes to quality and pricing.

Potential of PPP model for providing universal healthcare in India:

- **Enhancing affordability:** There has been a steady increase in the number of drugs under price control, to make medicines affordable.
- **Enhances Inclusivity:** It's difficult for government alone to meet the healthcare infrastructure and capacity gaps in Tier II and Tier III cities as well as rural areas. To provide Health insurance- Karnataka's Yeshasvini Cooperative Farmer's Healthcare Scheme and Andhra Pradesh's Arogya Raksha Scheme can be cited as successful examples.
- **Financing Mechanism:** The partnership between the public and the private sectors in healthcare is important for several reasons including equity and for promoting economic development.
- **Infrastructure:** NITI Aayog has sought to infuse fresh life into PPP in healthcare delivery through a new model focused on district hospitals and new norms on pricing of procedures. The provisions for making available infrastructure of district hospitals to private providers for 30 years along with viability gap funding appears that we have got the design right for the PPP model.
- **Quality of Service:** Private healthcare in India usually offers quality service but is often expensive and largely unregulated. The Delhi government's new scheme is a novelty for the common man but has a precedent in several government schemes for employees which use public funds to provide private healthcare. e.g the Central Government Health Scheme (CGHS) has existed for decades and has been emulated by several states.
- **Capacity building and training:** private players can play a key role in capacity building and training through PPP modes by working with the public sector to better utilize the infrastructure of government hospitals.

Issues in public private partnership

- There is lack of inbuilt mechanism to decide how the government and the private sector share revenue and risks.
- Aim of Private sector is to maximize profit, which is inconsonance with governments aim of providing universal quality services to all
- Lack of a proper regulatory framework to regulate the health sector and partnership.
- Some PPP projects attempted earlier have failed, so there is apprehension about success of large scale PPP in health sector.

Measures needed:

- **Staunch and well-defined governance:** An institutional structure should be set up to foster, monitor and evaluate the PPPs. This needs to be established at the state-level under the leadership of the state health ministry.
- **Equitable representation of partners in the institutional framework:** Institutional structure is a cornerstone for development of a sustainable PPP project. It will help to meet consensus on shared responsibilities and roles and will facilitate communication among the partners leading to a strong sense of ownership and trust.
- **Evidence-based PPP:** Systematic research initiatives and mechanisms must be established to constantly understand the evolving needs and benefits to end users.

- **Regulate user fee:** One of the hurdles of engaging the private providers for public health service delivery is OOP expenditure. Therefore, it is important to regulate user fees of this sector under partnership.
- **Effective risk allocation and sharing:** Risks shall be allocated to the party best able to control and manage them so that value for money is maximised.

Conclusion:

To provide universal healthcare which is the need of hour given the dismal condition of healthcare sector in India. The key to success of PP partnership is mutual respect and trust with a common goal of providing quality care for all ages at affordable cost. This meaningful engagement may be the next game changer in healthcare for the country.

Budget documents aid in understanding the intention of the government, its priorities, policies and allocation of resources, In this context discuss in detail the process of budgeting followed in India.(250 words)

Indian polity by Lakshmikanth

Why this question:

The question is from the static portions of GS paper III.

Key demand of the question:

One has to discuss the process of Budget that is followed in the country and the significance of Budget documents.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Discuss what Budget is in brief.

Body:

The question is direct and very much straight forward.

Discuss briefly the concept of Budget, the processes involved; The budget has four stages viz., (1) estimates of expenditures and revenues, (2) first estimate of deficit, (3) narrowing of deficit and (4) presentation and approval of budget.

Explain the role of Budget documents in understanding the intention of the government.

Discuss the importance of having a Budget for the government.

Use an example to substantiate your answer better.

Conclusion:

Conclude that When it comes to budgeting, identifying areas of weakness helps the government to allocate resources in a useful and sustainable manner.

Efficient, effective and bottom up budgetary processes help determine efficacy of this planned document.

Introduction:

The Union Budget of India, referred to as the annual Financial Statement in Article 112 of the Constitution of India, is the annual budget of the Republic of India, presented each year on the last working day of February by the Finance Minister of India in Parliament. The budget has to be passed by the House before it can come into effect on April 1, the start of India's financial year. It establishes a financial roadmap for the country in the ensuing financial year. Every year the Department of Economic Affairs in the Ministry of Finance prepares the Union Budget which is presented by the Finance Minister.

**Body:**

There are several steps involved in the preparation, presentation and implementation of the Union Budget.

▪ The initial processes:

- The initial processes involved in the Budget-making begin in August-September, around six months prior to the presentation of the Budget.
- The Finance Ministry sends Budget Circulars containing skeleton forms and necessary instructions/guidelines to concerned ministries and departments.
- These circulars are then distributed amongst disbursing and field officers who provide details about financial expenditures and receipts of their department during the current and past fiscal year, and their financial requirements for the ensuing fiscal year.

▪ Accumulation and authorization of data:

- The data and estimates provided by ground-level officials are then scrutinized by top officials of their departments.
- Upon approval (or revision, if necessary), the data and estimates are then sent to the concerned ministries where they are examined again.
- Finally, the data and estimates are sent to the Finance Ministry.
- The Finance Ministry further scrutinizes these and correlates the estimates with the current economic state and the available resources to determine their feasibility.

▪ Composing the Budget:

- After analysing every aspect carefully, the Finance Ministry then allocates revenues to various administrative ministries and devises new public welfare schemes.
- At times, there are disputes between ministries over the allocation of resources.
- In such scenarios, the Finance Ministry consults the Union Cabinet or the Prime Minister.
- Their decision is deemed final in such scenarios.
- After completing the allocation of resources to future expenditures, the Finance Ministry in association with Central Board of Direct Taxes and Central Board of Excise and Customs prepares a report of the estimated revenues to be generated in the ensuing financial year.
- In the final stage, both the reports are consolidated to generate the final Union Budget.
- During this process, various departments of the Finance Ministry consult stakeholders in the public domain (such as farmers and small business owners) to gain more insights and prepare an efficient budget.

▪ Printing the Budget:

- The printing process of the Union Budget begins with the observance of a tradition, 'the halwa ceremony'.

- In this, the Finance Minister along with other officials and staff involved in the process eat halwa (a traditional Indian dessert).
- Post completion of the ceremony, the printing process of the Union Budget begins.
- During this process, all the officials and staff involved in Budget-making remain confined to the premises of the ministry, isolated from any contact with the outside world, since they have the knowledge of what has gone into the Budget days before it is tabled in Parliament.
- **Presenting the Budget:**
 - The Union Budget is presented in the Parliament by the Finance Minister. For the past few years, the Union Budget is presented on a scheduled date, February 1.
 - In an election year, the Budget is prepared and presented twice.
 - Initially, a vote on account or interim budget — which is an estimate of expenditures and receipts of the next two-four months — is presented.
 - After the election, the final Budget for the rest of the fiscal year is presented by the new government.
 - In parliament, the budget goes through 5 stages
 - Presentation of budget with Finance Minister's speech
 - General discussion of the budget. After this, there is an adjournment of houses so that standing committees scrutinises the demand for grants for a month.
 - Voting on demand for grants in Lok Sabha
 - Passing of appropriation bills
 - Passing of Finance bills.

Conclusion:

Indian constitution under Article 112-117 enshrines powers of parliament in the enactment of the Budget. According to article 112-117, any proposal for expenditure and demand for a grant can be made only on the recommendation of the President. The parliament has to pass a financial bill within 75 days of its introduction. After discussion in both the houses on demand for Grants, Financial bill and appropriation bill and voting of the Lok Sabha Budget is enacted and expenditure can be incurred from the consolidated fund of India.

Effects of liberalization on the economy, changes in industrial policy and their effects on industrial growth

Discuss the challenges facing the Indian Textile Sector in detail and suggest ways and means to upsurge domestic manufacturing and promotion of exports in the this Sector.(250 words)

[Business Standard](#)

[Financial Express](#)

Why this question:

The question aims to analyse the challenges of textile industry in the country and need for a strong policy to address the issues and make the sector a strong and flourishing one.

Key demand of the question:

Discuss the challenges facing the Indian Textile Sector in detail and suggest ways and means to upsurge domestic manufacturing and promotion of exports in the this Sector.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

First discuss key statistics of the textile sector. Indian textile industry is one of the largest industries in India. It is the second largest industry in terms of providing employment opportunities to more than 35 million people in the country. Indian Textile industry contributes to 7 per cent of industrial output in terms of value, 2 per cent of India's GDP and to 15 per cent of country's export earnings.

Body:

List the challenges of the Indian Textile Sector –

The Indian Textile Sector is losing to competition because of lack of FTAs (Free Trade Agreements) with the EU and the USA.

The small scale of business is making it difficult for textile manufacturers to compete on cost with players from outside.

India is facing huge competition from other countries in Ready-made Garment (RMG) Exports, particularly cotton. And while the world of fashion is moving towards "Blends", India is not making many blended apparel items. So on the one side our traditional items are facing competition, and on the other side we are behind in Product Diversification.

Textile imports from Vietnam and Bangladesh are cheaper for buyers across the world.

Suggest remedies to the above challenges.

Conclusion:

Conclude that Exports are critical, but textile manufacturers should focus on the opportunities in the domestic market too.

Introduction:

The Indian textile and apparel industry can be broadly divided into two segments – yarn & fibre, and processed fabrics & apparel. Indian textile industry has some deep-rooted problems which needs to be addressed with long-term sustainable solutions

Body:

The government recently said the **new Textiles Policy 2020** being formulated by the Centre is aimed at developing in the country a competitive textile sector which is modern, sustainable and inclusive. This new policy will have a special focus on manufacturing of apparel and garment, technical textiles, man-made fibre products and exports.

The policy will entail the strategy and action plan for the country's textile and apparel segments, while maintaining pre-eminent position in handicraft and handloom sectors.

Challenges faced by Indian textiles sector:

- **Market Reality:** India's textile industry grapples with domestic issues including outdated technology, inflexible labour laws, infrastructure bottlenecks, and a fragmented nature of the industry.

- The textiles sector in India, primarily dominated by the unorganized and small players, had taken a major hit with demonetization and the implementation of the goods and services tax (GST).
- **Global Policies:** According to the WTO's Agreement on Subsidies and Countervailing Measures, a country needs to phase out export subsidies for a product as it achieves export competitiveness, defined as 3.25% share in world trade, and the per-capita income reaches more than \$1,000 per annum.
- As per this agreement, India is under pressure to end export subsidy for the textiles sector by 2018.
- This implies that the existing subsidy schemes including the Merchandise Export from India Scheme (MEIS) and the Export Promotion Capital Goods (EPCG) Scheme will get affected by the same.
- **Demand for MMF:** Globally, manmade textiles and garments are in high demand, with the ratio of cotton-to-manmade-fibre consumption at 30:70.
- India, despite being the second-largest textiles exporter in the world, lags in this category because of unavailability of manmade fibres at competitive prices.
- **Free-trade pacts:** like the South Asia Free Trade Agreement (SAFTA) have led to intense competition from countries like Bangladesh which have zero-duty access to the Indian market. The government should take a re-look at such pacts and try to work out a solution.
- The government should aim at driving scale across the textiles value chain by encouraging large investment, consolidation of firms and enlargement of clusters.
- **Impact of recent reforms:** The sector went through a phase of stagnating exports, demonetisation, bank restructuring and implementation of the Goods and Services Tax (GST).
- India, which was the second largest exporter of Textile & Clothing between 2014 and 2017 after China, slipped to the fifth place losing its position to Germany, Bangladesh and Vietnam.
- **Delay in disbursement of subsidies:** Fast-track disbursement of subsidies for technology up-gradation under the TUFs scheme to help the industry modernise the operation.

Measures needed:

- Government needs to move away from export-specific subsidy, which violates WTO norms, to focus on regional and cluster subsidies, technology upgradation and skill development subsidies, which benefit all the producers.
- In India, cotton and manmade fibres (MMF) have differential tax treatment, here fibre neutrality will give a boost to the industry.
- Under differential tax treatment cotton is taxed at 5% and manmade fibres at 12%.
- In fact, of the total textiles and clothing exports from India, cotton accounts for around 75%, there is a need to increase production with the global consumption patterns.
- While India has abundant supply of labour, flexibility in labour laws and adequate skilling will give a big boost to the textiles industry.
- For instance, women should be allowed to work in all three shifts, after taking into account adequate safeguard measures.
- Technology upgradation schemes will help Indian players to increase both their productivity and competitiveness.
- In addition, the government needs to carefully evaluate the various trade agreement opportunities Bangladesh and Vietnam benefit from favourable access to some of the big apparel markets.

- The government also needs to re-look at fibre neutrality and evaluate various trade agreement opportunities, while domestically focusing more on technology upgradation and skill development.

Conclusion:

There is a need to expand the production base to non-traditional areas where abundant land and labour are available.

Discuss the key objectives of industrial policy in India and explain how does it impact on the economy and industry?(250 words)

India Year Book 2019

Why this question:

The question is straightforward and is from the static portions of the GS paper III.

Key demand of the question:

Discuss in detail key objectives of industrial policy in India and explain its impact on the economy.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Explain that Industrial Policy is a typical character of a mixed economy. It is policy of government intervention which is sector specific and is aimed at giving preferential treatment to a particular sector over others.

Body:

First explain why an industrial policy is desirable.

Present arguments for and against industrial policy.

Discuss the key objectives.

Explain the impact on the economy and industry in specific aspects.

Conclusion:

Conclude with importance of a strong Industrial policy for the growth and development of the country.

Introduction

In 1991, when India faced a severe economic crisis, the government passed a new Industrial Policy resolution. The **Industrial policy of 1991** set out directions for industrialization in an economy that began its journey in liberalization. It dealt with liberalizing licensing and measures to encourage foreign investments.

The Government of India will be introducing a New Industrial Policy that will replace the 27-year-old existing policy and pave the way for the promotion of new technology and reduced regulations. The policy aims to create jobs over the next two decades, promote foreign technology transfer and attract \$100 billion FDI annually.

Body

Objectives of Industrial Policy in India

- Liberalizing the industry from the regulatory devices such as licenses and controls.
- Enhancing support to the small scale sector.

- To maintain a sustained growth in productivity;
- To enhance gainful employment;
- To achieve optimal utilization of human resources;
- To attain international competitiveness; and
- To transform India into a major partner and player in the global arena.
- Increasing competitiveness of industries for the benefit of the common man.
- Ensuring running of public enterprises on business lines and thus cutting their losses.
- Providing more incentives for industrialization of the backward areas, and
- Ensuring rapid industrial development in a competitive environment
- Promoting workers participation in management, enhancing their welfare and equipping them to deal with inevitability of technological change.

Impact on economy and industry

- **Opening up of Industry:** Sectors that were earlier exclusively reserved for public sector were reduced. Presently, **only two sectors- Atomic Energy and Railway operations-** are reserved exclusively for the public sector.
 - This has led to efficiency of markets and increased India's competitiveness.
- **De-licensing:** Abolition of Industrial Licensing for all projects except for a short list of industries. There are only 4 industries at present related to security, strategic and environmental concerns, where an industrial license is currently required-
 - Electronic aerospace and defence equipment
 - Specified hazardous chemicals
 - Industrial explosives
 - Cigars and cigarettes of tobacco and manufactured tobacco substitutes
- **Disinvestment of Public Sector:** Government stakes in Public Sector Enterprises were reduced to enhance their efficiency and competitiveness. Government in Budget 2020 announced raising Rs 1.20 lakh crore through disinvestment.
 - The idea is, for the government to play the role of facilitator and a regulator.
- **Liberalization of Foreign Investment:** This was the first Industrial policy in which foreign companies were allowed to have majority stake in India. In 47 high priority industries, upto 51% FDI was allowed. For export trading houses, FDI up to 74% was allowed.
 - Today, there are numerous sectors in the economy where government allows 100% FDI through automatic route.
 - It has increased our ease of doing business and India stands at 63rd position from 100th position in 2017.

- **Foreign Technology Agreement:** Automatic approvals for technology related agreements.
- **MRTTP Act** was amended to remove the threshold limits of assets in respect of MRTTP companies and dominant undertakings. MRTTP Act was replaced by the Competition Act 2002.

Significance of Industrial Policy for India

- The 1991 policy made **'License, Permit and Quota Raj'** a thing of the past. It attempted to liberalize the economy by **removing bureaucratic hurdles** in industrial growth.
- Limited role of Public sector reduced the burden of the Government.
- The policy provided **easier entry of multinational companies**, privatization, removal of asset limit on MRTTP companies, liberal licensing.
 - All this resulted in increased competition, that led to lower prices in many goods such as electronics prices. This brought domestic as well as foreign investment in almost every sector opened to private sector.
- The policy was followed by special efforts to increase exports. Concepts like Export Oriented Units, Export Processing Zones, Agri-Export Zones, Special Economic Zones and lately National Investment and Manufacturing Zones emerged. All these have benefitted the export sector of the country.

The Government of India will be introducing a New Industrial Policy that will replace the 1991 policy and pave the way for the promotion of new technology and ease of doing business.

Conclusion

- It is time for enabling accelerated reforms for greater strategic engagement and ensure that India is integrated into the global value chains. It is time to Reform, Perform and Transform.
- A comprehensive, actionable, outcome-oriented industrial policy will enable Industry to deliver a larger role in the economy; to fulfil its role as the engine of growth and to shoulder the responsibility of adding more value and jobs.

What is liberalization in education? Discuss the impact of it on Indian Education system. (250 words)

Indian economy by Dutta and Sundaram

Why this question:

The question aims to discuss the impact of liberalization upon the education system of India.

Key demand of the question:

Explain the impact of liberalization on education in general and specifically present the Indian education system scenario.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly highlight the concept of liberalization.

Body:

Liberalization refers to relaxing certain reforms and policies in India.

Our policy in terms of education is focused more on only expanding the system with no focus on for quality education. One of the basic problems today is the inability of the university system to provide higher education to all who aspire for it.

Discuss its importance to education.

Expand upon the impact it rendered to Indian education system.

Conclusion:

Conclude with way forward.

Introduction

Liberalization refers to relaxing certain reforms and policies in India. Usually, the term is used in reference to Economic Liberalization. Though India is Economically Liberal, the Education System is not Liberal. There are many reasons, one of them is that the national education should become a commodity that only a few can afford.

According to the Article 25 of the Companies Registration Act, educational institutes in India can be set up by trusts, societies and charitable companies, but the profits cannot be taken out of the institution and have to be reinvested. However, the government does not define and clarify rules for foreign universities to set up campuses in India. Interested parties have been hesitant about moving forward until they are clear about the degree of regulation, funding, and other issues.

Body

Liberalization in India

Positive Impact

- Liberalisation will bring a constant stream of funding which will also facilitate a research-based career and make it a viable option for the future of Indian teachers and students.
- It will expand the supply which is in shortage and the competition among educational institutions will ensure that they do not charge an excessive premium for education. Increase in the supply of education will automatically result in the fall in education expenditure.
- The Indian economy which is majorly fueled by the service industry will get a boost with the education sector becoming a large chunk of the economic source.
- Hundreds of thousands of Indian students study abroad at an annual estimated cost of around US\$ 1 billion and it can even stem the exodus of thousands of students who left the country to study abroad. It also curbs brain drain which is also a nation's loss.
- Allowing corporates would ensure the development of better industry-oriented graduates with specific skill sets.
- Increased in educated population implies rapid developments in technology and communications. It also implies the shift of society from industrialization based towards an information-based society.
- Liberalisation offers students an option of studying close to home with the added benefit of a degree which will be valid worldwide.

Negative Impact

- The international higher education is largely an unregulated market. While no doubt that there are prestigious universities hoping to build links overseas, recruit top students to their home campuses and strengthen their brand abroad.
 - But there is no dearth of mere sub-prime and low-end private institutions which are seeking to stave off bankruptcy through the export market and there are even a few respectable universities which have been forced by government funding cutbacks to raise cash elsewhere.
- Students and local institutions in developing countries are also similarly unregulated. At many times ill-informed and often naive.
 - Students tend to avail such services without much information or understanding.
 - Uninformed or simply dubious institutions in developing countries may form partnerships with low-quality colleges and universities in India. Students may be falsely tempted under the guise of foreign label.
- There is also the risk of fake institutes which are looking to stuff their pockets whenever the opportunity arises.
- Local institutes which have limited capital will not be able to survive, rendering many jobless. Even the reputed ones will face competition as their national certificates will be less valued as compared to the world recognized certificates.

Conclusion

- A possible solution to this policy is that the government should regulate the sector. Foreign universities can be regulated by giving them a limited period trial, a probation period. And it would on the basis of performance in the trial period, that these universities will be allowed to set up long-term operations. To ensure that national interests are served and the students do not receive an inferior service from unscrupulous providers, there needs to be transparency. This will also help universities think about their motivations for entering the market.

Major crops cropping patterns in various parts of the country, different types of irrigation and irrigation systems storage, transport and marketing of agricultural produce and issues and related constraints; e-technology in the aid of farmers Massive inefficiency in the grain management system under the National Food Security Act (NFSA) of the country calls for pressing attention. Discuss the needs for urgent reforms in grain management system. (250 words)

[Indian Express](#)

Why this question:

The article provides for a detailed analysis as to how Reforms in grain management system could free up resources for infrastructure investment.

Key demand of the question:

The answer must bring out the existing issues with grain management and in what way newer reforms are the need of the hour.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Suggest few facts highlighting the importance of grain management to the output of Agriculture. Agriculture still engages about 44 per cent of India's workforce.

Body:

First highlight massive inefficiency in the grain management system under the National Food Security Act (NFSA).

Use data from the article and highlight the inefficiencies in the system.

Discuss the role of FCI in management of grains in the country.

Explain what needs to be done? Suggest measures to overcome the situation.

Conclusion:

Conclude with way forward.

Introduction:

The National Food Security Act (NFSA) gives certain quantities of wheat and rice to 67 per cent of the population at Rs 2/kg and Rs 3/kg respectively, while the economic cost of these to the Food Corporation of India is Rs 25/kg and Rs 35/kg respectively.

The FCI had pending bills of Rs 1.86 lakh crore that have not been cleared by the government, and that it has been asked to borrow more and more to finance its operations. The grain stocks with the FCI are far more than double the buffer stock norms as on January 1, every year.

Body:

Need for urgent reforms in grain management system is due to the following:

- **Issues with procurement:**

- Open-ended Procurement: All incoming grains accepted even if buffer stock is filled creating a shortage in the open market.
- The recent implementation of Nation food security act would only increase the quantum of procurement resulting in higher prices for grains.
- The gap between required and existing storage capacity.
- The **open market operations (OMO)** are much less compared to what is needed to liquidate the excessive stocks.

- **Issues with storage:**

- Inadequate storage capacity with FCI.
- Food grains rotting or damaging on the CAP or Cover & Plinth storage.
- The money locked in these excessive stocks (beyond the buffer norm) is more than Rs 1 lakh crore.

- **Issues with allocation of food grains:**

- Inaccurate identification of beneficiaries.

- Illicit Fair Price shops: The shop owners have created a large number of bogus cards or ghost cards (cards for non-existent people) to sell food grains in the open market.
- **Issues with transportation:**
- Leakages in food grains distribution to be reduced as most leakages in PDS takes place in initial stages.

Important recommendations made by Shanta Kumar Committee.:

- Reduce the number of beneficiaries under the Food Security Act—from the current 67 per cent to 40 per cent.
- While the poor under the Antyodaya category should keep getting the maximum food subsidy, for others, the issue price should be fixed at, say, 50 per cent of the procurement price (as was done under Atal Bihari Vajpayee for the BPL category)
- Allow private players to procure and store food grains.
- Stop bonuses on minimum support price (MSP) paid by states to farmers, and adopt cash transfer system so that MSP and food subsidy amounts can be directly transferred to the accounts of farmers and food security beneficiaries.
- Limit the procurement of rice particularly in the north-western states of Punjab and Haryana where the groundwater table is depleting fast, and invite private sector participation in grain management
- FCI should involve itself in full-fledged grains procurement only in those states which are poor in procurement. In the case of those states which are performing well, like Haryana, Punjab, Andhra Pradesh, Chhattisgarh, Madhya Pradesh and Odisha, the states should do the procurement.
- **Abolishing levy rice:** Under levy rice policy, government buys certain percentage of rice (varies from 25 to 75 per cent in states) from the mills compulsorily, which is called levy rice. Mills are allowed to sell only the remainder in the open market.
- Deregulate fertiliser sector and provide cash fertiliser subsidy of Rs 7,000 per hectare to farmers.
- **Outsource of stocking of grains:** The committee calls for setting up of negotiable warehouse receipt (NWR) system. In the new system, farmers can deposit their produce in these registered warehouses and get 80 per cent of the advance from bank against their produce on the basis of MSP.
- Clear and transparent liquidation policy for buffer stock: FCI should be given greater flexibility in doing business; it should offload surplus stock in open market or export, as per need.

Conclusion:

The Committee recommendations however was criticized due to suggestions like limiting NFSA, cash subsidy, privatization of FCI despite suggesting useful reforms to reform FCI, PDS. A closer scrutiny in the recommendation is needed today in times of agricultural distress & drought prone years.

Irrigation is pivotal to agricultural, social, economic growth of nation. Discuss in detail the benefits and concerns associated with Irrigation systems in the country.(250 words)

A Comprehensive Geography by Khullar

Why this question:

The question is from the static portions of the GS paper 3.

Key demand of the question:

Discuss the significance of Irrigation system and the concerns associated with it.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Quote first the significance of irrigation system to agriculture of the country.

Body:

Irrigation has provided stability to food production. It is critical, yet a vital input of agriculture production process. Civilizations have risen and fallen with the growth and decline of their irrigation systems, while others have maintained sustainable irrigation for thousands of years. Many of the problems in irrigated agriculture can be mitigated or avoided by improved technology and management, and by adequately addressing cultural, social, and environmental aspects.

Discuss the benefits of Irrigation in detail and the challenges/concerns posed.

Suggest what needs to be done to overcome such challenges.

Conclusion:

Conclude that Irrigation is pivotal to agricultural, social, economic growth of nation. Irrigation has provided stability to food production.

Introduction:

Irrigation is the process of applying water to the crops artificially to fulfil their water requirements. Nutrients may also be applied to the crops through irrigation. The various sources of water for irrigation are wells, ponds, lakes, canals, tube-wells, and even dams. Irrigation offers moisture required for growth and development, germination, and other related functions.

Body:

Types of Irrigation:

There are different types of irrigation practised for improving crop yield. These types of irrigation systems are practised based on the different types of soils, climates, crops and resources. The main types of irrigation followed by farmers include:

- **Surface Irrigation:**
 - In this system, no irrigation pump is involved. Here, water is distributed across the land by gravity.
- **Localized irrigation:**
 - In this system, water is applied to each plant through a network of pipes under low pressure.
- **Sprinkler irrigation:**
 - Water is distributed from a central location by overhead high-pressure sprinklers or from sprinklers from the moving platform.
- **Drip Irrigation:**
 - In this type, drops of water are delivered near the roots of the plants. This type of irrigation is rarely used as it requires more maintenance and

- **Centre Pivot Irrigation:**
 - In this, the water is distributed by a sprinkler system moving in a circular pattern.
- **Sub-irrigation:**
 - Water is distributed through a system of pumping stations gates, ditches and canals by raising the water table.
- **Manual Irrigation:**
 - This a labour intensive and time-consuming system of irrigation. Here, the water is distributed through watering cans by manual labour.

Benefits of Irrigation:

- Insufficient and uncertain rainfall adversely affects agriculture. Droughts and famines are caused due to low productivity. Irrigation helps to increase productivity even in low rainfall.
- The productivity on irrigated land is higher as compared to the un-irrigated land.
- Multiple cropping is not possible in India because the rainy season is specific in most of the regions. However, the climate supports cultivation throughout the year. Irrigation facilities make it possible to grow more than one crop in most of the areas of the country.
- Irrigation has helped to bring most of the fallow land under cultivation.
- Irrigation has stabilized the output and yield levels.
- Irrigation increases the availability of water supply, which in turn increases the income of the farmers.

Threats posed by Irrigation:

- **Delays in completion of projects:** In most of the projects, there have been delay in construction of field channels and water courses, land levelling and land shaping.
- **Inter-state Water disputes:** Irrigation is a state subject in India. As a result, difference with regard to storage, priorities and use of water arise between different states. Narrow regional outlook brings inter-state rivalries over distribution of water supply.
- **Regional disparities in irrigation development:** The Ninth Five Year Plan Document estimated that the water resource development in North Eastern region through major, medium and minor schemes is only at the level of 28.6 per cent whereas in the Northern region it has reached about 95.3 per cent.
- **Water-logging and salinity:** Introduction of irrigation has led to the problem of water logging and salinity in some of the states.
- **Increasing cost of irrigation:** The cost of providing irrigation have been increasing over the years from the first five-year plan to tenth five-year plan.
- **Decline in water table:** There has been a steady decline in water table in the recent period in several parts of the country, especially in the western dry region, on account over exploitation of ground water and insufficient recharge from rain-water.

Measures needed:

- Large public and private investment for expanding the irrigation system to accelerate agricultural growth and to meet the needs of food security;
- More efficiency in managing the irrigation system;
- Speedy exploitation of irrigation potential from major and medium sources;

- Completion of on-going projects, improvement in the utilisation of irrigation potential and expansion of rural electrification in the eastern region and replacement of high-cost diesel pump sets;
- Ensuring a conjunctive use of surface and ground water;
- The original Gadgil formula, which, earmarked 10 per cent of the total resource to the State Plans for major and medium irrigation and power projects should be revived;
- A major part of saving of fertiliser subsidy be given to States as grant for irrigation expansion; Suitable incentives be extended for advancing hi-tech irrigation systems like the microprocessor-based drip irrigation technology that has proven ability to save 25 per cent chemical fertilisers, halve the water used and nearly double the yields;
- Farmers stakes in irrigation work be raised by conferring on them some degree of co-ownership the irrigation system; and
- A comprehensive watershed management plan need be formulated and effectively implemented.

Conclusion:

The farmers should be acquainted with the type of soil moisture, quality of irrigation water, frequency of irrigation for the proper implementation of irrigation systems.

What are the different types of cropping patterns prevalent in India? Discuss the diversity of cropping pattern across the country.(250 Words)

A comprehensive geography by Khullar

Why this question:

The question is directly from the static portions of GS paper III.

Key demand of the question:

Discuss in detail the different types of cropping patterns prevalent in India and explain the diversity of cropping pattern across the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Start by explaining what you understand by a cropping pattern.

Body:

Cropping pattern is the yearly sequence and spatial arrangement of crops and fallow on a given area. Cropping system comprises all cropping patterns grown on the farm and their interaction with farm resources, other household enterprises and the physical, biological, technological and sociological factors or environments.

Discuss the determining factors of a cropping pattern.

Explain the spatial aspect across the country.

Conclusion:

Conclude with importance of having a suitable cropping pattern for good yields.

Introduction:

Cropping pattern is a dynamic concept because it changes over space and time. It can be defined as the proportion of area under various crops at a point of time. In other words, it is a yearly sequence and spatial arrangement of sowing and fallow on a given area. In India, the cropping pattern determined by rainfall, climate, temperature, soil type and technology.

**Body:****Major important cropping patterns of India:**

Rabi crops are sown in winter from October to December and harvested in summer from April to June. Some of the important Rabi crops are wheat, barley, peas, gram and mustard. Though, these crops are grown in large parts of India, states from the north and north-western parts such as Punjab, Haryana, Himachal Pradesh, Jammu and Kashmir, Uttarakhand and Uttar Pradesh are important for the production of wheat and other rabi crops. Availability of precipitation during winter months due to the western temperate cyclones helps in the success of these crops. However, the success of the green revolution in Punjab, Haryana, western Uttar Pradesh and parts of Rajasthan has also been an important factor in the growth of the above-mentioned rabi crops.

Kharif crops are grown with the onset of monsoon in different parts of the country and these are harvested in September-October. Important crops grown during this season are paddy, maize, jowar, bajra, tur (arhar), moong, urad, cotton, jute, groundnut and soyabean. Some of the most important rice-growing regions are Assam, West Bengal, coastal regions of Odisha, Andhra Pradesh, Telangana, Tamil Nadu, Kerala and Maharashtra, particularly the (Konkan coast) along with Uttar Pradesh and Bihar. Recently, paddy has also become an important crop of Punjab and Haryana. In states like Assam, West Bengal and Odisha, three crops of paddy are grown in a year. These are **Aus, Aman and Boro**.

In between the Rabi and the kharif seasons, there is a short season during the summer months known as the **Zaid season**. Some of the crops produced during 'zaid' are watermelon, muskmelon, cucumber, vegetables and fodder crops. Sugarcane takes almost a year to grow.

Diversity of cropping patterns across the country:

- **Rice-Wheat:** UP, Punjab, Haryana, Bihar, West Bengal, Madhya Pradesh.
- **Rice-Rice:** Irrigated and Humid coastal system of Orissa, Tamil Nadu, Andhra Pradesh, Karnataka and Kerala.
- **Rice- Groundnut:** Tamil Nadu, Andhra Pradesh, Karnataka, Orissa and Maharashtra
- **Rice-Pulses:** Chhattisgarh, Orissa and Bihar.
- **Maize-Wheat:** UP, Rajasthan, MP and Bihar.
- **Sugarcane-Wheat:** UP, Punjab and Haryana accounts for 68% of the area under sugarcane. The other states which cover the crops are; Karnataka and MP.
- **Cotton-Wheat:** Punjab, Haryana, West UP, Andhra Pradesh, Karnataka, Tamil Nadu.
- **Soya bean-Wheat:** Maharashtra, MP and Rajasthan
- **Legume Based Cropping Systems (Pulses-Oilseeds):** MP, Gujarat, Maharashtra, Andhra Pradesh and Karnataka.

Factors affecting Cropping pattern: Cropping pattern of any region depends upon many factors

- **Physical and Technical Factors:**
 - These include the physical characteristic as soil, climate, weather rainfall etc. In the dry regions where the rainfall is scanty and where there is high uncertainty of monsoons, the dependence is on jowar and bajra. Water logging areas cultivate rice.
 - Cropping pattern also depend upon irrigation facilities. Where ever water is available, not only can a different crop be grown but even double or triple cropping will be possible.
- **Economic Factors:**

- Economic motivation is the most important in determining the cropping pattern of the country. Among the various economic factors affecting crop pattern, the following are important:
 - **Price and Income Maximisation:** Price variations exert an important influence on acreage shifts. The variation in the inter-crop prices led to shifts in acreage as between the crops.
 - **Farm Size:** There is a relationship between the farm size and the cropping pattern. The small farmers are first interested in producing food grain for their requirements. Small holder therefore devotes relatively small acreage to cash crops than large holders.
 - **Insurance against risk:** The need to minimise the risk of crop failures not only explains diversification but also some specific features of crop patterns.
 - **Availability of Inputs:** Seeds, fertilizers, water storage, marketing, transport etc. also affect the cropping pattern.
 - **Tenure:** Under the crop sharing system, the landlord has a dominant voice in the choice of the cropping pattern and this helps in the adoption of income maximising crop adjustments.
- **Infrastructure facilities:**
 - Irrigation, transport, storage, trade and marketing, post-harvest handling and processing etc
- **Government Policies:**
 - The legislative and administrative policies of the government may also affect the cropping pattern. Food Crops Acts, Land Use Acts, intensive schemes for paddy, for cotton and oilseeds, subsidies affect the cropping pattern.
 - MSP – farmers shifting to wheat, rice
 - Green Revolution – skewed cropping pattern in Northern India towards wheat and rice from coarse cereals and pulses
- **Social factors**
 - Food habits also play a role – East and South India prefers rice as staple food while it is wheat in North India.

Conclusion:

The cropping pattern in India has undergone significant changes over time. As the cultivated area remains more or less constant, the increased demand for food because of increase in population and urbanisation puts agricultural land under stress resulting in crop intensification and substitution of food crops with commercial crops.

**“ICT is becoming the facilitator of socio-economic development in rural India”,
Elucidate.(250 words)**

[Insights On India](#)

Why this question:

The question is from the static portions of the GS paper III, aims to evaluate the role of ICT in the aid of farmer.

Key demand of the question:

Discuss the aspects of ICT that contribute to the socio-economic development in rural India.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Highlight that ICT is becoming the facilitator of socio-economic development in rural India with its obvious facilities by way of health, education, financial services and employment avenues, etc. It can help the bridge gaps by providing 'e' and 'm' services.

Body:

Explain that the ICT offering meant for rural sector can be classified into three categories:

Those solutions which aim are aimed at empowerment

Those which would do enablement.

Those for market expansion.

Quote recent case studies such as e-chaupal to substantiate your answer better.

Discuss the pros and cons of having ICT aid the farming process.

Conclusion:

Conclude that E-Agriculture; a new area of knowledge emerging out of convergence of IT and farming techniques is the future.

Introduction:

ICT can be interpreted broadly as “technologies that facilitate communication and the processing and transmission of information by electronic means.” ICT promises a fundamental change in all aspects of our lives, including knowledge dissemination, social interaction, economic and business practices, political engagement, media, education, health, leisure and entertainment.

Body:

Evolving Internet in India:

- Commercial Internet services in India were launched in August 1995.
- The initial launch of Internet in 1995 was with dial-up access speeds of upto 9.6 kbps.
- The initial launch of Internet services was with a rate of Rs25, 000 for a 250-hour TCP/IP (Transmission Control Protocol/Internet Protocol) account applicable for commercial organizations (amounting to Rs100 per hour).
- The number of Internet users in India was expected to reach 450-465 million by June, according to the Internet and Mobile Association of India (Iamai) and market researcher IMRB.
- Around 72% of Internet users in India are less than 35 years of age,
- 80% of all web traffic in India emanates from the mobile—second highest in the world, after Nigeria.
- Total number of telephone subscribers were 1,210.84 million as of 17 June, according to Trai.
- Wireless accounted for 1,186.84 million subscriptions.
- Broadband subscribers stood at 301 million at the end of June, according to Trai.

Internet has emerged as a potent tool that can lead to socio- economic empowerment:

• **ICT and agriculture:**

- The vast majority of poor people lives in rural areas and derives their livelihoods directly or indirectly from agriculture.
- Increasing the efficiency, productivity and sustainability of small-scale farms is an area where ICT can make a significant contribution. Farming

involves risks and uncertainties, with farmers facing many threats from poor soils, drought, erosion and

- ICTs can deliver useful information to farmers about agriculture like crop care and animal husbandry, fertilizer and feedstock inputs, pest control, seed sourcing and market prices.
- **ICT for Education:**
 - Moreover, appropriate use of ICTs in the classroom fosters critical, integrative and contextual teaching and learning; develops information literacy (the ability to locate, evaluate and use information).
 - Thus, it improves the overall efficiency of the delivery of education in schools and educational management institutions at the national, state/provincial and community level.
 - The use of ICTs in education aims to improve the quality of teaching and learning as well as democratize the access to education.
- **ICT for Economic Development:**
 - Information and Communication Technology has a vital role in connecting the rural community to outside world for exchange of information, a basic necessity for economic development.
 - Effective use of ICT can demolish geographical boundaries and can bring rural communities closer to global economic systems and be of meaningful help to the underprivileged.
- **Employment Opportunities:**
 - Poor people in rural localities have lack of opportunities for employment because they often do not have access to information about them.
 - One use of ICTs is to provide on-line services for job placement through electronic labour exchanges in public employment service or other placement agencies
- **ICT in e-Governance:**
 - The poverty can be adequately addressed by effective use of e-governance and ICT application in environmental management. Improved governance by using ICT can have direct impact in reducing poverty and improving the environment.
 - ICT can contribute in a large way in making government processes more efficient and transparent by encouraging communication and information sharing among rural and marginalized people.
- **ICT in Capacity-building and empowerment:**
 - Communities and farmer organisations can be helped through the use of ICTs to strengthen their own capacities and better represent their constituencies when negotiating input and output prices, land claims, resource rights and infrastructure

- ICT enables rural communities to interact with other stakeholders, thus reducing social isolation.
- It widens the perspective of local communities in terms of national or global developments, opens up new business opportunities and allows easier contact with friends and relatives. A role is also played by ICT in making processes more efficient and transparent.
- It helps in making laws and land titles more accessible. Global Positioning Systems (GPS) linked to Geographical Information Systems (GIS), digital cameras and internet, help rural communities to document and communicate their situation.
- Rural communities benefit from better access to credit and rural banking facilities.
- Recent mobile banking initiatives offer further scope to reduce costs and stimulate local
- The Indian AMUL programme automates milk collection and payments for its 500,000 members, thereby enhancing transparency of the milk volume and quality collected and ensuring fair payments to farmers.
- **ICT and Service delivery mechanisms:**
 - There is a huge gap between information residing in agricultural knowledge centres and rural communities.
 - At local level, multi-stakeholder mechanisms are important to make relevant information accessible to end users. Intermediary organizations have to connect rural communities to available Users will increasingly want tailor-made, quality answers to their questions.
 - In the Agricultural Clinics in India customers get answers within one to two days.
 - Mobile Q&A services are being piloted in India.
 - At national level, mechanisms need to be in place to ensure learning and information sharing.
- **ICT and Health:**
 - Health care is one of the most promising areas for poverty alleviation.
 - ICTs are being used in India to facilitate remote consultation, diagnosis and treatment.
 - Delivering health care with ICTs enables health care professionals and institutions to address the critical medical needs of rural communities, especially those in remote locations and those that lack qualified medical personnel and services.
- **Role of ICT under climate change:**
 - ICTs can enable access to the set of resources in the event of climate change related shocks or disturbances.
 - ICTs provide access to relevant data and information that is first processed at an individual level, then facilitate communication and interaction between a wide range of stakeholders, and ultimately enable cooperation, which can translate into adaptive

actions being implemented with the participation of a wide range of stakeholders.

- ICTs can also speed up access to information.
- This is particularly important when an acute climate related shock such as landslide or flood
- Mobile based telecommunications networks allow rapid communication of information, thus improving the speed of disaster warning, response and recovery

Conclusion:

The use of ICT tools help in strengthening social networks, empowerment and participation, as well as fostering productive processes at the local level through the provision of employment and skills, as well as support services for micro-enterprise activities. In rural communities of developing countries, with limited capacities and resources to respond to the effects of extreme natural hazards, drought, landslides, floods, and to the impacts of these events on local social systems (e.g. health, infrastructure, transportation, migration), ICT tools (the potential of telecentres for disaster preparedness and response) are emerging as an area of increasing interest.

What do you understand by Conservation Agriculture? Discuss the key principles of such a practice and elucidate upon its significance.(250 words)

FAO

Why this question:

The question is based on the topic of Conservation Agriculture and its importance.

Key demand of the question:

Discuss the concept of Conservation Agriculture in detail and highlight the prospects of such a concept.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

First define What Conservation Agriculture is? – Conservation Agriculture (CA) is a farming system that can prevent losses of arable land while regenerating degraded lands.

Body:

Discuss the aspects of Conservation agriculture.

It promotes maintenance of a permanent soil cover, minimum soil disturbance, and diversification of plant species. It enhances biodiversity and natural biological processes above and below the ground surface, which contribute to increased water and nutrient use efficiency and to improved and sustained crop production.

Explain the basic principles involved in it.

Discuss how CA facilitates good agronomy, such as timely operations, and improves overall land husbandry for rainfed and irrigated production. C

Conclusion:

Conclude with positive note and highlight that CA is a base for sustainable agricultural production intensification.

Introduction

Conservation Agriculture (CA) is defined as a sustainable agriculture production system comprising a set of farming practices adapted to the requirements of crops and local conditions of each region, whose farming and soil management techniques protect the soil from erosion and degradation, improve its quality and biodiversity, and contribute to the preservation of the natural resources, water and air, while optimizing yields.

Body

Agronomic practices included in CA are based on three core principles, which must be fulfilled concomitantly:

- Minimum soil disturbance.
- Maintenance of permanent soil covers.
- Cropping system diversity, crop rotations.

Key Principles of Conservation Agriculture

Conservation Agriculture is based on three main principles adapted to reflect local conditions and needs:

- **Minimum mechanical soil disturbance:** Minimum soil disturbance refers to low disturbance no-tillage and direct seeding. The disturbed area must be less than 15 cm wide or less than 25% of the cropped area (whichever is lower). There should be no periodic tillage that disturbs a greater area than the aforementioned limits. Strip tillage is allowed if the disturbed area is less than the set limits.
- **Permanent soil organic cover:** Three categories are distinguished: 30-60%, >60-90% and >90% ground cover, measured immediately after the direct seeding operation. Area with less than 30% cover is not considered as CA.
- **Species diversification:** Rotation/association should involve at least 3 different crops. However, repetitive wheat, maize, or rice cropping is not an exclusion factor for the purpose of this data collection, but rotation/association is recorded where practiced.

Significance

Conservation Agriculture prevents losses of arable land while regenerating degraded lands. It promotes maintenance of a permanent soil cover, minimum soil disturbance, and diversification of plant species. It is significant for following reasons:-

- **Enhanced biodiversity:** It enhances biodiversity and natural biological processes above and below the ground surface, which contribute to increased water and nutrient use efficiency and to improved and sustained crop production.
- **Carbon sequestration:** No till fields act as a sink for CO₂ and conservation farming applied on a global scale could provide a major contribution to control air pollution in general and global warming in particular. Farmers applying this practice could eventually be rewarded with carbon credits.
- **Labour savings:** Soil tillage is among all farming operations the single most energy consuming and thus, in mechanized agriculture, air-polluting, operation. By not tilling the

soil, farmers can save between 30 and 40% of time, labour and, in mechanized agriculture, fossil fuels as compared to conventional cropping.

- **Sustainable:** Complemented by other known good practices, including the use of quality seeds, and integrated pest, nutrient, weed and water management, etc., CA is a base for sustainable agricultural production intensification.
- **Mixed Farming possible:** It opens increased options for integration of production sectors, such as crop-livestock integration and the integration of trees and pastures into agricultural landscapes.
- **Increased yields:** Conservation agriculture is by no means a low output agriculture and allows yields comparable with modern intensive agriculture but in a sustainable way. Yields tend to increase over the years with yield variations decreasing.
- **Reduced costs:** For the farmer, conservation farming is mostly attractive because it allows a reduction of the production costs, reduction of time and labour, particularly at times of peak demand such as land preparation and planting and in mechanized systems it reduces the costs of investment and maintenance of machinery in the long term

Conclusion

Today, approximately one-third of the planet's soils are degraded. In many countries, intensive crop production has depleted soils, to the extent that future production in these areas is jeopardized. Healthy soils are key to developing sustainable crop production systems that are resilient to the effects of climate change. CA facilitates good agronomy, such as timely operations, and improves overall land husbandry for rainfed and irrigated production.

Issues related to direct and indirect farm subsidies and minimum support prices; Public Distribution System- objectives, functioning, limitations, revamping; issues of buffer stocks and food security; Technology missions; economics of animal-rearing.

Write a short note on National Mission on Sustainable Agriculture.(250 words)

[Vikaspedia](https://www.vikaspedia.com)

Why this question:

The question is direct from the static portions of GS paper III.

Key demand of the question:

Discuss in detail the NMSA project, highlight its key objectives, quote facts of achievements so far, challenges if any and conclude with way forward.

Structure of the answer:

Introduction:

National Mission for Sustainable Agriculture (NMSA) has been formulated for enhancing agricultural productivity especially in rain fed areas focusing on integrated farming, water use efficiency, soil health management and synergizing resource conservation.

Body:

Briefly discuss the mission objectives first.

Explain the mission strategy.

Discuss the major components of the scheme in detail.

Take hints from the reference and cover majority aspects in your answer.

**Conclusion:**

Conclude with significance of such missions to the agro-economics of the country.

Introduction:

National Mission on Sustainable Agriculture (NMSA) is one of the eight Missions under the **National Action Plan on Climate Change (NAPCC)** seeks to address issues regarding 'Sustainable Agriculture' in the context of risks associated with climate change by devising appropriate adaptation and mitigation strategies for ensuring food security, equitable access to food resources, enhancing livelihood opportunities and contributing to economic stability at the national level. It has been formulated for enhancing agricultural productivity especially in rainfed areas focusing on integrated farming, water use efficiency, soil health management and synergizing resource conservation.

Body:**Significance of National Mission for Sustainable Agriculture:**

- Sustaining agricultural productivity depends on quality and availability of natural resources like soil and water.
- Agricultural growth can be sustained by promoting conservation and sustainable use of these scarce natural resources through appropriate location specific measures.
- Indian agriculture remains predominantly rainfed covering about 60% of the country's net sown area and accounts for 40% of the total food production.

Objectives of National Mission for Sustainable Agriculture:

- To promote location specific Integrated/Composite Farming Systems that makes agriculture more productive, sustainable, and remunerative and climate resilient.
- To adopt appropriate soil and moisture conservation measures that will enhance the conservation of natural resources.
- To adopt comprehensive soil health management practices based on soil fertility maps, soil test based application of macro & micro nutrients, judicious use of fertilizers etc.
- There should be optimisation of utilization of water resources through efficient water management to expand coverage for achieving 'more crops per drop'.
- To develop capacity of farmers & stakeholders, in conjunction with other on-going Missions e.g. National Mission on Agriculture Extension & Technology, National Food Security Mission, National Initiative for Climate Resilient Agriculture (NICRA) etc., in the domain of climate change adaptation and mitigation measures.
- There should be selection of block by the pilot model for improving productivity of rain-fed farming by mainstreaming rain-fed technologies refined through NICRA and by leveraging resources from other schemes/Missions like Mahatma Gandhi National Rural Employment Guarantee Scheme (MGNREGS), Integrated Watershed Management Programme (IWMP), and RKVY etc.
- There should be establishment of an effective inter and intra Departmental/Ministerial co-ordination for accomplishing the goal of National Mission for Sustainable Agriculture under the aegis of NAPCC.

Important components:

- Rainfed Area Development (RAD)
- Sub-Mission on Agroforestry (SMAF)
- National Bamboo Mission (NBM)

- Soil Health Management (SHM)
- Climate Change and Sustainable Agriculture: Monitoring, Modelling and Networking (CCSAMMN)
- Paramparagat Krishi Vikas Yojana (PKVY)

Challenges:

- Proposed provision and strategies are highly extensive which is only targeting the big farmers and rest are remaining vulnerable.
- Sustainable Agriculture is based on an understanding of ecosystem services, the study of relationships between organisms and their environment.
- But the proposed strategies of the mission given importance of water and largely ignored the usage of chemical fertilizers. The use of chemical fertilizer required more irrigation as compare to the organic farming.
- The mission is lacked by the adequate framework to meet the climate change especially challenges faced by agriculture due to the climate change.

Conclusion:

Conservation of natural resources in conjunction with development of rainfed agriculture holds the key to meet burgeoning demands for food grain in the country. Towards this end, National Mission for Sustainable Agriculture (NMSA) has been formulated for enhancing agricultural productivity especially in rainfed areas focusing on integrated farming, water use efficiency, soil health management and synergizing resource conservation.

With suitable Illustrations, explain how Livestock farming backed by Agricultural Extension services can help weaker sections of society.(250 words)

FAQ

Why this question:

Question is based on the topic of economics of animal-rearing.

Key demand of the question:

Discuss in detail the benefits of Livestock farming backed by Agricultural Extension services. And the positive impact it brings in development of weaker sections of the society.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Dis

Body:

Explain that Livestock make a major, although largely underestimated, contribution to rural development in developing countries. They produce food, enhance crop production and provide additional economic goods and services as well as cash income.

The inclusion of livestock diversifies and increases total farm production and income, provides year-round employment and disperses risk. Sales of livestock products provide funds for purchasing crop inputs and for financing farm investments

Livestock often form the major capital reserve of farming households and, in general, enhance the economic viability and sustainability of a farming system.

Explain how linking it with agri extension services can help weaker sections of the society.

Discuss the stakeholders that will benefit from such a combination of services; Women, Rural areas etc.

Conclusion:

Conclude with way forward.

Introduction:

India's livestock sector is one of the largest in the world. About 20.5 million people depend upon livestock for their livelihood. Livestock contributed 16% to the income of small farm households as against an average of 14% for all rural households. Livestock provides livelihood to two-third of rural community. It also provides employment to about 8.8 % of the population in India. India has vast livestock resources. Livestock sector contributes 4.11% GDP and 25.6% of total Agriculture GDP.

India's withdrawal from the Regional Comprehensive Economic Partnership (RCEP) is considered as a major victory for the farmer's organisations, trade unions, MSME organisations and civil society groups, which had protested against the free trade agreement. RCEP would have proven suicidal for India's dairy sector.

Body:

Trends in livestock population: (Source: 20th Livestock Census)

- Total Livestock population is 535.78 million- an increase of 4.6% over Livestock Census-2012.
- Total Bovine population (Cattle, Buffalo, Mithun and Yak)-79 Million in 2019- an increase of about 1% over the previous census.
- A decline of 6 % in the total Indigenous/ Non-descript cattle population over the previous census.
- The population of cows in the country has risen by 18 per cent in the last seven years, while that of oxen dipped by 30 per cent, according to the latest census of livestock.
- there was a spectacular 16.8 per cent increase in the poultry population in the country to 851.81 million, mainly on account of a 46 per cent rise in backyard poultry birds, whose numbers have gone up to 317 million.
- The number of female cattle is 145.12 million, which is 18 per cent over the 122.98 million in 2012. The number of male cattle, on the other hand, dropped to 47.4 million as against 67.92 million in 2012.
- While cattle accounted for 35.94 per cent of total livestock in the country, goats accounted for 27.80 per cent, buffaloes: 20.45 per cent, sheep: 13.87 per cent and pigs: 1.69 per cent.

Role of livestock in socio-economic life of India:

The livestock plays an important role in the economy of farmers. The farmers in India maintain mixed farming system i.e. a combination of crop and livestock where the output of one enterprise becomes the input of another enterprise thereby realize the resource efficiency. The livestock serve the farmers in different ways.

▪ **Income:**

- Livestock is a source of subsidiary income for many families in India especially the resource poor who maintain few heads of animals.
- Cows and buffaloes if in milk will provide regular income to the livestock farmers through sale of milk.

- Animals like sheep and goat serve as sources of income during emergencies to meet exigencies like marriages, treatment of sick persons, children education, repair of houses etc.
- The animals also serve as moving banks and assets which provide economic security to the owners.
- **Employment:**
 - A large number of people in India being less literate and unskilled depend upon agriculture for their livelihoods.
 - But agriculture being seasonal in nature could provide employment for a maximum of 180 days in a year.
 - The land less and less land people depend upon livestock for utilizing their labour during lean agricultural season.
- **Food:**
 - The livestock products such as milk, meat and eggs are an important source of animal protein to the members of the livestock owners.
 - The per capita availability of milk is around 355 g / day; eggs is 69 / annum;
- **Social security:**
 - The animals offer social security to the owners in terms of their status in the society.
 - The families especially the landless which own animals are better placed than those who do not.
 - Gifting of animals during marriages is a very common phenomenon in different parts of the country.
 - Rearing of animals is a part of the Indian culture. Animals are used for various socio religious functions.
 - Cows for house warming ceremonies; rams, bucks and chicken for sacrifice during festive seasons;
 - Bulls and Cows are worshipped during various religious functions. Many owners develop attachment to their animals.
- **Gender equity:**
 - Animal husbandry promotes gender equity.
 - More than three-fourth of the labour demand in livestock production is met by women.
 - The share of women employment in livestock sector is around 90% in Punjab and Haryana where dairying is a prominent activity and animals are stall-fed.
- **Draft:**
 - The bullocks are the back bone of Indian agriculture.

- The farmers especially the marginal and small depend upon bullocks for ploughing, carting and transport of both inputs and outputs.
- **Dung:**
 - In rural areas dung is used for several purposes which include fuel (dung cakes), fertilizer (farm yard manure), and plastering material (poor man's cement).

Conclusion:

With increasing population, persistent rise in food inflation, unfortunate rise in farmer's suicide and majority of the Indian population having agriculture as the primary occupation, the practice of animal husbandry is no more a choice, but a need in contemporary scenario. Its successful, sustainable and skilful implementation will go a long way in ameliorating the socio-economic condition of lower strata of our society. Linking the animal husbandry with food processing industry, agriculture, researches & patents has all the possible potential to make India a nutritional power house of the world. Animal husbandry is the imperative hope, definite desire and urgent panacea for India as well as the world.

What is Pradhan Mantri LaghuVyapariMaan-dhan Yojana? Discuss the Significance of the scheme and its role in ensuring financial security of the citizens. (250 words)

Vikaspedia

Why this question:

The National Pension Scheme for Traders and Self-Employed Persons has failed to gain traction as only about 25,000 persons have opted for the scheme as against the government's target to enroll 50 lakh by March-end. Thus the question.

Key demand of the question:

Discuss the key features, Significance of the scheme and its role in ensuring financial security of the citizens.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Start by bringing out the relevance of the scheme to the agricultural setup of the country.

Body:

Explain What is Pradhan Mantri LaghuVyapariMaan-dhan Yojana? It is a voluntary and contribution based central sector scheme. The government launched the scheme, entailing monthly minimum assured pension of ₹3,000 for the entry age group of 18-40 years after attaining the age of 60 years, with effect from July 22, 2019.

Explain in detail the significance, beneficiaries it caters to.

Conclusion:

Conclude with way forward.

Introduction:

The National Pension Scheme for Traders and Self Employed Persons Yojana (Pradhan Mantri Laghu Vyapari Maan-dhan Yojana) is a pension scheme for shopkeeper's/ retail traders and self-employed persons for providing monthly minimum assured pension of Rs 3000/- for the entry age group of 18-40 years. The scheme is an **extension of the PM Shram Yogi Maan-dhan Yojana**. It

is a **voluntary** and **contribution based central sector scheme**. Under the scheme, the government makes matching contribution in the subscribers' account. The scheme is based on self-declaration as no documents are required except bank account and Aadhaar Card.

Body:

Significance of the Pradhan Mantri Laghu Vyapari Maan-Dhan Yojana (PMLVM):

- All shopkeeper, retail traders and the self-employed individual will receive a monthly pension of Rs.3000 after attaining the age of 60 years.
- Under the PMLVM scheme, the eligible beneficiary will have to make a monthly contribution of Rs.55 to Rs.200 depending upon their age limit.
- The Central/State Government will make an equal contribution to the beneficiary account. For example, if a person with the age of 30 years will have to contribute Rs.105 per month, then the Government also contributes the same amount as subsidy into the beneficiary account.
- The Life Insurance Corporation of India, which acts as the pension fund manager, is responsible for the disbursement of pension amount.
- In case of permanent disability of beneficiary before superannuation age, the spouse can continue in the scheme by remitting the balance amount until you reach the loan tenure. If there is no spouse, then the total contribution along with interest will be paid to the beneficiary.
- In case of death occurs after the retirement date, the spouse will receive 50% of the pension as the family pension. After the loss of both the pensioner and the spouse, then the fund will be credited back to the nodal agency.

Role in ensuring financial security:

- Each eligible subscriber under this Scheme shall receive assured minimum monthly pension of Rs 3000 after attaining the age of sixty years.
- The Government of India will make matching contribution in the subscribers' account. For example, if a person with age of 29 years contributes Rs. 100/- month, then the Central Government also contributes the equal amount as subsidy into subscriber's pension account every month.
- **Benefits on disablement:** If an eligible subscriber has given regular contributions and become permanently disabled due to any cause before attaining his age of 60 years, and is unable to continue to contribute under this Scheme, his spouse shall be entitled to continue with the Scheme subsequently by payment of regular contribution as applicable or exit the Scheme by receiving the share of contribution deposited by such subscriber, with interest as actually earned thereon by the Pension Fund or the interest at the savings bank interest rate thereon, whichever is higher.
- **Benefits to the family on death of an eligible subscriber:** During the receipt of pension, if an eligible subscriber dies, his spouse shall be only entitled to receive fifty per cent. of the pension received by such eligible subscriber, as family pension and such family pension shall be applicable only to the spouse.

Conclusion:

In India, as of now, we do not have any Social Security System. So, this scheme can benefit, especially the low income group and individuals who are retail traders and shop keepers.

Do you agree that it is the bounden duty of scientific community to find long-term solutions to the problems faced by farmers and improve crop productivity? Comment and discuss the significance of research and technology to Agriculture. (250 words)

Business-Standard

New Indian Express

Why this question:

The Vice President of India, M Venkaiah Naidu called upon the scientific community to find long-term solutions to the problems faced by farmers and improve crop productivity and farmers' income. Thus the context of the question.

Key demand of the question:

Explain how relevant it is to involve scientific community and research in developing long-term solutions to the problems faced by farmers and improve crop productivity.

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

In general discuss the importance of research and science in developing newer methods and discovering newer ways to address the challenges of Agriculture in the country.

Body:

Emphasis upon the critical role of technology in enhancing both the quality and quantity across the agriculture value chain from the use of inputs at the pre-production stage to post-production and marketing to improve the income of farmers.

Explain that It is the bounden duty of scientific community to find long-term solutions to the problems faced by farmers and improve crop productivity. Scientists need to explore ways to make crops more "climate-resilient, nutrition-efficient and less water consuming". The role of technology is critical in enhancing

Both the quality and quantity across the agriculture value chain from the use of inputs at the pre-production stage to post-production and marketing to improve the income of farmers.

Conclusion:

Conclude that Science is significant in finding solutions and Technological innovation was a key driver in boosting economy, improving people's lives and Enabling better delivery of services.

Introduction:

Agriculture has always been a lifeline for India. Even though with age, India has made a mark in various spheres and has progressed in the manufacturing sector by leaps and bounds, but agriculture still remains one of the key drivers of the economy. Worldwide, India ranks second in farm output and accounts for about 50% of the country's workforce.

Body:

Need for scientific community to find long-term solutions:

- The **lack of remunerative prices** for the crops is one of the main reasons for Agrarian distress in India today.
- The various options like **Minimum Support Price** for about 25 crops, **Farm Loan Waiver** schemes undertaken by various state governments have failed to alleviate the problem.
- The NSSO Situation Assessment Survey of Agricultural Households (2013) shows that 52% of farming households are indebted, with rates as high as 89-92% in some States.

- Climate change affects all the three aspects of food security: availability, access and absorption.
- Agricultural productivity is sensitive to climate-induced effects like changes in temperature, precipitation and carbon dioxide concentrations in the atmosphere
- According to 2018 Economic Survey, India incurs losses of about \$9-10 billion annually due to extreme weather events.
- It also noted farmers' income losses from climate change would be between 15 % and 18 % on an average.

Science and Technology has helped in Agriculture:

- Modern agricultural technology allows a small number of people to grow vast quantities of food and fiber in a shortest period of time.
- Modern transportation technology facilities help farmers easily transport fertilizers or other farm products to their farms, and it also speeds the supply of agricultural products from farms to the markets where consumers get them on a daily basis.
- Cooling facilities help farmers to deliver perishable crops to keep them fresh as they transport them to the market. These cooling facilities are installed in food transportation trucks, so crops like tomatoes will stay fresh upon delivery.
- Genetically produced plants like potatoes, can resist diseases and pests, which rewards the farmer with good yields and saves them time. These crops grow very fast they produce healthy yields.
- Advanced water sprinklers are being used to irrigate big farms and this helps the crops get enough water which is essential in their growth.
- Most of these genetically produced animals will produce more milk or fur compared to normal animals. This benefits the farmer because their production will be high.

Technology has played a big role in developing the agricultural industry. Today it is possible to grow crops in a desert by use of agricultural biotechnology. With this technology, plants have been engineered to survive in drought conditions. Through genetic engineering scientists have managed to introduce traits into existing genes with a goal of making crops resistant to droughts and pests. However, after nearly four decades into the post green revolution period, the country still grapples with crisis each year in trying to meet the increasing demand for food by its people. **Structural reforms needed** are:

- **Credit, finance and Insurance:**
 - Raising the MSP, price deficiency payments or income support schemes can only be a partial solution to the problem of providing remunerative returns to farmers.
 - A **functional institutional credit system** which is accessible and accountable to all cultivators.
 - This covers not only land-owning farmers but also sharecroppers, tenants, adivasi and women farmers, and animal-rearers.
 - Credit products for agriculture need to be tailor-made based on cropping and rain cycle, specific to a particular region. The regional offices of commercial banks should contribute in this exercise. Registration of all cultivators and providing Kisan credit cards.
 - The period of crop loan should be extendable to four years, given that, on average, every second or third year the spatial distribution of rain pattern is erratic in India.

- **Land holdings:**
 - The average size of farm holdings **declined from 2.3 hectares in 1970-71 to 1.08 hectares in 2015-16.**
 - Policies for land consolidation along with land development activities in order to tackle the challenge of the low average size of holdings.
 - Farmers can **voluntarily come together** and pool land to gain the benefits of size. Through consolidation, farmers can reap the economies of scale both in input procurement and output marketing.
- **Input Costs:**
 - It is more important to make agriculture sustainable by reducing input costs of seeds, fertilizers and other inputs.
 - Investment in infrastructure and research and development are needed.
 - There is a need for collaboration of **industry-academia** for coming out with cost-effective solutions to agrarian distress.
 - There is a need to make a shift from rice and wheat-centric policies to millets, pulses, fruits, vegetables, livestock and fish.
- **Remunerative Prices:**
 - Extending reach of minimum support price which has been dedicated to few crops and in a narrow geographical area is important.
 - Set up of Futures and Trade markets, tie up of farmer and private companies for procurement should be looked into as alternative methods against distress sale.
- **Agro- Produce Marketing and Processing:**
 - The creation of a **competitive, stable and unified national market** is needed for farmers to get better prices.
 - For better price for farmers, agriculture has to go beyond farming and **develop a value chain comprising farming, wholesaling, warehousing, logistics, processing and retailing.**
 - The agro-processing industry and warehousing needs to expand so that agricultural produce can be stored when prices plunge.
 - Promoting viable farmer collectives to act as a “collective voice of marginal and small farmers”.
 - Legislations on the basis of NITI Aayog’s new model law — **Agricultural Produce and Livestock Marketing (Promotion and Facilitating) Act (APLM)** should be enacted in all states.
 - A sustainable solution is market reforms to enable better price discovery combined with long-term trade policies favourable to exports.
- **Technology:**

- Use water-use efficient technologies that can improve significantly the produce like drip irrigation and sprinkler irrigation.
- Precision agriculture, GM Crops should be encouraged drought prone areas.
- Space technology and Mobiles should act as “Eyes and Ears” of the farmers to assist in farming.
- **Distress Management:**
 - Establish farmers’ distress and disaster relief commissions at the national and State levels, based on the model of Kerala Farmers’ Debt Relief Commission.

Conclusion:

Although Science and Technology did help improve the situation of Agriculture but the farmer income dropped consistently due to a variety of reasons. There is a need for implementation of the structural reforms and recommendations of various commissions to realise the **goal of doubling of farmer’s income by 2022.**

What do you understand by Integrated Farming System? How far is the Integrated Farming System helpful in sustaining agricultural production? Elucidate in the Indian context. (250 words)

[Agritech](#)

Why this question:

The question is straightforward and is based on the concept of Integrated Farming System and its relevance to India agriculture system.

Key demand of the question:

Discuss in detail the concept of IFS, discuss its relevance and significance to the Indian Setup.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly explain what Integrated Farming System is.

Body:

Discuss Role of Integrated Farming System and in what way it is helpful in sustaining agricultural production.

The Integrated Farming System (IFS) is a combined approach aimed at efficient sustainable resource management for increased productivity in the cropping system. The IFS approach has multiple objectives of sustainability, food security, farmer’s security and poverty reduction by involving livestock, vermicomposting, organic farming etc.

Discuss the possible challenges involved.

Conclusion:

Conclude with way forward such as Integrating subsistence agriculture, Encouraging livestock enterprises, Building farmer capacities etc.

Introduction:

Integrated farming system (IFS) refers to agricultural system that integrates livestock and crop production to deliver more sustainable agriculture. IFS utilizes the crop- livestock interaction as shown below in the cyclic diagram, according to Economic Survey 2018-19.

Body:

IFS and sustaining agricultural production:

- Higher food production to equate the demand of the exploding population of our nation
- Increased farm income through proper residue recycling and allied components
- Sustainable soil fertility and productivity through organic waste recycling
- Integration of allied activities will result in the availability of nutritious food enriched with protein, carbohydrate, fat, minerals and vitamins
- Integrated farming will help in environmental protection through effective recycling of waste from animal activities like piggery, poultry and pigeon rearing
- Reduced production cost of components through input recycling from the byproducts of allied enterprises
- IFS components are known to control the weed and regarded as an important element of integrated pest management and thus minimise the use of weed killers as well as pesticides and thereby protect the environment.
- Regular stable income through the products like egg, milk, mushroom, vegetables, honey and silkworm cocoons from the linked activities in integrated farming
- Inclusion of biogas & agro forestry in integrated farming system will solve the prognosticated energy crisis
- Cultivation of fodder crops as intercropping and as border cropping will result in the availability of adequate nutritious fodder for animal components like milch cow, goat / sheep, pig and rabbit
- Firewood and construction wood requirements could be met from the agroforestry system without affecting the natural forest
- Avoidance of soil loss through erosion by agro-forestry and proper cultivation of each part of land by integrated farming
- Generation of regular employment for the farm family members of small and marginal farmers.
- IFS promote the efficient management of resources. This enhances the productivity of the farming.
- The IFS promotes for rejuvenation of systems productivity and to achieve agroecological equilibrium.

IFS in Indian perspective:

- Some IFS features like Organic farming, and developing a judicious mix of income-generating activities such as dairy, poultry, fishery, goat-rearing, vermicomposting and others, and community-led local systems for water conservation etc help in reducing farmers' distress.
- Integrated Farming Systems suitable particularly for hilly regions of the North Eastern Region can be adopted.

- Some are as – Integrated Fish cum Pig farming, Integrated Fish cum Duck Farming, Integrated Fish Farming-Chicken, Integrated Fish farming-cum-Cattle farming, Integrated Fish farming-cum-Rabbit farming, Integrated Fish farming-cum-Agriculture.
- Sikkim being an organic state is a good example.

Case studies:

1. **Integrated Fish Cum Pig farming in North east-** Pig sites are constructed on pond embankment. Pig manure (feaces and urine) are directly drained into the pond which acts as pond fertilizer and increases the biological productivity of [pond water, thus increasing the fish production. Also, fish feed directly on pig excreta, which cuts down the cost of feed as well. This system has helped to improve the status of weaker rural communities, especially tribals in North eastern states.
2. **Integrated fish farming cum Horticulture** – Embankments of fish ponds provide area for planting fruits and vegetable. When Banana and Coconut is cultivated in rows in wetlands, the ditches made between such rows act as supply canal. These canals serve as fish culture system due to regular supply of water and rich insect populations. In turn it naturally boosts the productivity of soil and yield of fruits and vegetables.

Conclusion:

Keeping in mind the benefits of crop- livestock interaction, Economic Survey (2018-19) has suggested to improve Resource Efficiency for Small holder agriculture (as 85 % of agriculture is dominated by small and marginal farmers), where organic farming (ZBNF, Cow Farming, Vedic Farming, Homa farming) and increasing water productivity should be given a thrust. Economic survey (2018-19) has also suggested to capitalise Small ruminants (Sheep and Goats), especially in water stressed regions for additional source income for farmers.

Briefly discuss the objectives of Agricultural and Processed Food Products Export Development Authority (APEDA). Discuss in detail the functions performed by it and analyse its contributions to the Indian agriculture. (250 words)

[Apeda](#)

Why this question:

The question is based on the roles and responsibilities delivered by Agricultural and Processed Food Products Export Development Authority (APEDA).

Key demand of the question:

Discuss in detail the objectives, functions, roles played by Agricultural and Processed Food Products Export Development Authority (APEDA).

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

The Agricultural and Processed Food Products Export Development Authority (APEDA) was established by the Government of India under the Agricultural and Processed Food Products Export Development Authority Act, 1985. It functions under the Ministry of Commerce and Industry. The Authority has its headquarters in New Delhi.

Body:

Discuss the key functions performed by APEDA.

APEDA is mandated with the responsibility of export promotion and development of the scheduled products viz. fruits, vegetables and their products; meat and meat products; poultry and poultry products; dairy products; confectionery, biscuits and bakery products etc.

Explain the composition of APEDA, how it works.

Discuss the work done so far by the authority.

Conclusion:

Conclude with significance.

Introduction:

The **Agricultural and Processed Food Products Export Development Authority (APEDA)** was established by the Government of India under the **Agricultural and Processed Food Products Export Development Authority Act** passed by the Parliament in December, 1985. It is established under the **Ministry of Commerce and Industry**, Government of India is mandated with the responsibility of export promotion and development of the following scheduled products.

Body:

Exports of India:

- India witnessed a jump of nearly 50 per cent in organic product exports touching the Rs 5151 crore-mark (\$757 million) in 2018-19.
- India exported organic products worth Rs 5151 Crore (over US \$ 757 million) in 2018-19, from Rs 3453 Crore in 2017-18 (US\$ 515 million) registering an increase of about 49 %.
- According to estimates by APEDA, flax seeds, sesame, soybean, tea, medicinal plants, rice and pulses such as arhar and chana are the key organic food products that drove this growth.
- The total volume of export during 2018-19 was 6.14 lakh tonnes

Objectives of APEDA:

- The objective of APEDA is to promote schedule products export and to achieve this various functions has been undertaken by this body under the regulation of central government.
- Central government lays down the rules and regulation and implements through this body for the efficient administration of APEDA Act.

Functions of APEDA:

- Development of industries relating to the scheduled products for export by way of providing financial assistance or otherwise for undertaking surveys and feasibility studies, participation in enquiry capital through joint ventures and other reliefs and subsidy schemes;
- Registration of persons as exporters of the scheduled products on payment of such fees as may be prescribed;
- Fixing of standards and specifications for the scheduled products for the purpose of exports;
- Carrying out inspection of meat and meat products in slaughter houses, processing plants, storage premises, conveyances or other places where such products are kept or handled for the purpose of ensuring the quality of such products;
- Improving of packaging of the Scheduled products;
- Improving of marketing of the Scheduled products outside India;
- Promotion of export oriented production and development of the Scheduled products;
- Collection of statistics from the owners of factories or establishments engaged in the production, processing, packaging, marketing or export of the scheduled products or from such

other persons as may be prescribed on any matter relating to the scheduled products and publication of the statistics so collected or of any portions thereof or extracts therefrom;

- Training in various aspects of the industries connected with the scheduled products;
- Such other matters as may be prescribed.

Conclusion:

APEDA has been promoting the export of various agricultural commodities and provides a platform to showcase India's quality produce to the global market. Ministry of Food Processing Industries and other agencies are working in close coordination; they are also focusing on exports. In addition, involving states since they also have an important role in encouraging exports of agriculture products from the region.

Discuss the economics of poultry industry in India .(250 words)

Indian Express

Why this question:

The question is straightforward and aims to discuss the economics of Poultry in India.

Key demand of the question:

Discuss in detail the economics of poultry industry in India.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Describe key facts of present poultry industry in India.

Body:

Discuss the importance of poultry farming.

Explain in what way it can augment the income of farmer.

Comment on the aspects of allied agriculture and the importance of poultry

Discuss the challenges associated and how to overcome it.

Explain what the policies of the govt. in this direction are.

Conclusion:

Conclude with significance.

Introduction:

India has the world's largest population of livestock. The country produces approximately **5.3 million MT of meat and 75 billion eggs annually**. India is also the largest producer of buffalo meat and second largest producer of goat meat. In essence, poultry and meat are vertically integrated industries in India and have witnessed colossal growth over the past few years.

Body:

The poultry industry in India, in particular, represents a massive success story. It has undergone a paradigm shift in structure and operation and what was largely a backyard venture before the 1960s has been transformed into a vibrant agribusiness with an annual turnover of INR 30 000 crores. Presently, India is the third largest egg producer in the world following China and the USA.

Potential of the poultry sector:

- The development goes beyond size – extending to efficiency, superiority and quality.

- **Labour:** Poultry sector, besides providing direct or indirect employment to nearly 3 million people is a potent tool for subsidiary income generation for many landless and marginal farmers.
- **Nutritional security:** For a distressed farmer's family, food provided by livestock is the only source of nutrition required for survival and also provides nutritional security.
- **Reliable source of income:** Further, landless labourers derive more than 50 per cent of their income from livestock especially from poultry.
- **Asset:** Livestock are important asset for a distress farmer which can be encashed at any moment and may help him to come out of debt trap.

Undoubtedly, this remarkable growth is an outcome of several factors, such as active developmental support from the state and central government, research and development support from research institutes, application of new technologies, international collaboration and private sector participation.

Way forward:

- Measures should be taken to increase the meat production efficiency of different species of animals using the improved management practices.
- Adoption of improved shelter management practices can reduce the environmental stress.
- New breeds should be developed for meat production with higher feed conversion efficiency, faster growth and disease resistant.
- Health management practices should be followed for prevention of diseases and economic loss to the farmers.
- Regular prophetic health measures should be carried out against infectious diseases. Regular screening of animals should be carried out against disease such as tuberculosis, brucellosis, salmonellosis etc.
- The livestock market yard should have basic facilities for feeding, watering and holding animals for days.
- By vertical integration with meat processing industries the middle men can be eliminated, which will ultimately increase the profit of farmers.
- There is need for modernizing the quality control laboratories of the State Government, apart from need for strict laboratory inspection of meat and meat products, training programs for meat workers regarding hygiene and sanitation need to be organized regularly.
- Modernization of abattoirs, setting up of rural abattoirs and registration of all slaughter houses in cities/towns are essential for quality meat production.
- The setting up of large commercial meat farms have been recommended to address the traceability issues necessary for stringent quality standards of CODEX.

Conclusion:

Poultry rearing has always been an integral component of livestock production system in India. The concept of composite farming production system with crop, livestock, fish and poultry production has been practiced for centuries in India. However, poultry production in India has taken a quantum leap in the last four decades, emerging from an entirely unorganized and unscientific farming practice to commercial production system with state-of-the-art technological interventions

Case study:

Records show that meat production was 4.69 lakh metric ton in 2017-18. Kerala is the 8th largest meat-producing state in the country, contributing 6.1 per cent of the meat produced in India. Out of the total, 38.8 per cent is poultry meat, 33.95 per cent from cattle and 20.99 per cent from buffalo.

Despite having a robust non-vegetarian food market, the processed meat market is negligible in Kerala. BDS, started in 1999 for implementing a dairy project in Wayanad, ventured into meat processing in 2013 and poultry in December 2018, thus opening new avenues for farmers.

Private agencies give only Rs 4 to Rs 6 as rearing charge for per kg of a live bird, which becomes ripe for the market in 45 days. But, BDS, which owns breeder farm and hatchery in Tamil Nadu, gives Rs 8 to Rs 11 as rearing charge as there is no middleman.

Food processing and related industries in India- scope and significance, location, upstream and downstream requirements, supply chain management.

Why are food processing industries significant? Discuss the Scope and Significance of Food Processing Industries in India. (250 words)

Comprehensive Indian Geography by Khullar

Why this question:

The question is directly from the static portions of the GS paper III.

Key demand of the question:

Discuss the significance of food processing industries, scope and its utility in the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly define food processing industries.

Body:

Discuss that Major industries constituting the Food processing industry are grains, sugar, edible oils, beverages and dairy products. The key sub-segments of the Food Processing industry in India are: Dairy, Fruits & Vegetables, Poultry & Meat processing, Fisheries, Food retail etc.

Suggest facts that bring out the significance of the industry.

Explain the significance and scope of it.

Conclusion:

Conclude with future avenues and opportunities that the Industry has for the Indian economy.

Introduction

Food processing generally includes the basic preparation of foods, the alteration of a food product (usually raw) into another form (as in making preserves from fruit), and preservation and packaging techniques. Food processing typically takes harvested crops or animal products and uses these to produce long shelf-life food products.

It includes the **process of value addition** to produce products through methods such as preservation, addition of food additives, drying etc. with a view to preserve food substances in an effective manner, enhance their shelf life and quality.

Body

- **Why are food processing industries significant?**

The **Food Processing Industry (FPI)** is of enormous significance as it provides vital linkages and synergies that it promotes between the two pillars of the economy, i.e. agriculture and industry.

- **Employment Opportunities:** Food processing industries can absorb a major share of workers from the agriculture sector, who face disguised unemployment. It can lead to better productivity and GDP growth.
- **Prevents Wastage:** Nearly one-third of the food that is produced each year goes uneaten, costing the global economy **over \$940 billion** as per report by **World Resources Institute (WRI)**
 - India is biggest producer of numerous fruits and vegetable. Most of these are perishable and have very low shelf life. This is the major reason for high percentage of wastage. Their shelf life can be increased through food processing.
- **Value Addition:** Products such as tomato sauce, roasted nuts, de-hydrated fruits are in high demand.
- **Reduce malnutrition:** Processed foods when fortified with vitamins and minerals can reduce the nutritional gap in the population.
- **Boosts Trade and Earns Foreign exchange:** It is an important source of foreign exchange. For e.g. Indian Basmati rice is in great demand in Middle Eastern countries.
- **Make in India:** Food processing is one of the six superstar sectors under the GoI's, Make in India initiative and has the potential to transform India as a leading food processing destination of the World.
- **Curbing Food Inflation:** Processing increases the shelf life of the food thus keeping supplies in tune with the demand thereby controlling food-inflation.
 - **For e.g.** Frozen peas/ corn are available throughout the year.
 - Similarly canned onions under Operation Greens can achieve price stability.
- **Doubling of farmers' income:** With contract farming, farmers can get better technological inputs from industries as well. There is income security and proportionate value for produce. They are also protected against price shocks.
- **Crop-diversification:** Food processing will require different types of inputs thus creating an incentive for the farmer to grow and diversify crops.

Scope and Significance in India

- **Scope of FPI**
 - India is the world's second largest producer of fruits & vegetables after China but hardly 2% of the produce is processed.
 - India is among the top 5 countries in the production of coffee, tobacco, spices, seeds etc. With such a huge raw material base, we can easily become the leading supplier of food items in the world.
 - In spite of a large production base, the level of processing is low (less than 10%). Approximately 2% of fruits and vegetables, 8% marine, 35% milk, 6% poultry are processed. Lack of adequate processable varieties continues to pose a significant challenge to this sector.
 - **Economic Survey 2020:** During the last 6 years ending 2017-18, Food Processing Industries sector has been growing at an average annual growth rate of around 5.06 per cent.

- **Employment:** According to the **Annual Survey of Industries** for 2016-17, the total number of persons engaged in registered food processing sector was **18.54 lakhs**. (whereas unregistered FPOs supports **51.11 lakh** workers)
- **Farmer Beneficiaries:** The SAMPADA scheme is estimated to benefit about **46.37 lakh** farmers and generate about **5.6 lakh direct/ indirect employment** (ES 2020 data).
- **Curbing Distress Migration :** Provides employment in rural areas, hence reduces migration from rural to urban. Resolves issues of urbanization.
- **Government Initiatives**
 - The Ministry of Food Processing Industries (MoFPI) is implementing **PMKSY (Pradhan Mantri Kisan SAMPADA Yojana)**. The objective of PMKSY is to supplement agriculture, modernize processing and decrease agri-waste.
 - Mega Food Parks.
 - Integrated Cold Chain, Value Addition and Preservation Infrastructure.
 - Creation/Expansion of Food Processing/Preservation Capacities.
 - Infrastructure for Agro Processing Clusters.
 - Scheme for Creation of Backward and Forward Linkages.
 - **Foreign Direct Investment (FDI) policy:** FDI up to 100%, under the automatic route is allowed in food processing industries.
 - **Agri Export Zones:** To give thrust to export of agro products, new concept of Agri Export Zones was brought in 2001. **APEDA** has been nominated as the Nodal Agency to coordinate the efforts
 - cluster approach of identifying the potential products;

the geographical region in which these products are grown;

- Adopting an end-to-end approach of **integrating the entire process** right from the stage of production till it reaches the market (farm to market).

Conclusion

Food processing has a promising future, provided adequate government support is there. Food is the biggest expense for an urban Indian household. About 35 % of the total consumption expenditure of households is generally spent on food. As mentioned, food processing has numerous advantages which are specific to Indian context. It has the capacity to lift millions out of undernutrition. Government has it's work cut out to develop industry in a way which takes care of small scale industry along with attracting big ticket domestic and foreign investments.

The agri value chain in India seems to be stuck in the cycle of low returns and low investment. Discuss the causative factors and analyse what needs to be done.(250 words)

[Science Direct](#)

Why this question:

The question is based on the problems that are being recurrently witnessed in the agricultural supply chain management in the country.

Key demand of the question:

Discuss in detail the issues concerning the Agri value chain and reasons for low returns of it and Suggest solutions to overcome such challenges.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain What is supply chain management in agriculture?

Body:

Discuss that in Agribusiness, supply chain management (SCM) implies managing the relationships between the businesses responsible for the efficient production and supply of products from the farm level to the consumers to meet consumers' requirements reliably in terms of quantity, quality and price

Explain what the issue with low returns and low investments is.

Discuss what needs to be done? Provide for cases where government has made efforts in this direction.

Conclusion:

Conclude with suitable solutions to plug in the loopholes in the system of agri value chain.

Introduction

The conceptual framework of agricultural value chains includes a sequence of value adding activities, from production to consumption, through processing and marketing. Each segment of a chain has one or more backward and forward linkages. A value chain in agriculture identifies the set of actors and activities that bring a basic agricultural product from production in the field to final consumption, where at each stage value is added to the product.

In South Asian countries, such as India, agricultural value chains are often fragmented; lack investment; and fail to include vulnerable groups and are missing critical linkages of farms and markets.

Body

- **Causative Factors for glut in Agri-Value Chain**

In India, agriculture system along with value chain framework has not been conceived as a main strategy to bring more efficiency, productivity and earnings. There has not been enough emphasis on the growth and development of efficient agricultural value chains in India.

- **Access to finance** : Most of the Indian agricultural value chain firm"s focusses on local market and they need more resources and capacity to compete in the external markets.
 - Credit for pre and post-harvest inputs, guarantee and risk for final output have not been made part of overall agriculture and export policies in India.
 - For example, many incentives are given to IT companies and new start-ups, such facilities are not extended to agricultural products exporting firms also.
 - Thus it is preventing forward integration of farmers.
- **Market Access**: The existence of middlemen and agents, absence of data and information about other links in the chain and inability to invest in improving the performance in almost every part of the chain led to inefficiencies.
 - Agricultural value chains are difficult to stabilise in India with a large number of small and marginal farmers.

- The production, collection, storage and delivery parts of value chains have to be made efficient in order for the small farmers to realise higher returns.
- **Capacity building:** Another major challenge is improvement in the production and supply competencies of the small and marginal farmers. To get better remunerative prices or to produce export quality produce, farmers must have adequate knowledge and capacity.
 - Most of the small and marginal farmers do not realise how to produce, store and preserve agricultural products in a modern and more sophisticated era and how to constantly check the quality.
- **Standards and certification:** Although, in case of agriculture based exportable products testing and health safety regulations and procedures are now mandatory but infrastructure (testing and certification laboratories at crucial custom ports equipped with trained and enough number of staff members) for these have not been up to mark in India.
- **Export Policy:** Exportable agricultural products are not being dealt with clear export promotion policy, which has hindered prospects of these products in overseas markets. **Eg:** Export restrictions can be made at any time. Minimum export price is imposed.
- **Significance of a robust Agri-value chain**
 - Prevent Colossal Wastage of Agriculture Produce “billions of dollars” loss to economy.
 - To ensure that share of Farmer in consumers wallet can increase, which is merely 25-30% as compared to western market where it goes as high as 50-75%.
 - Demand for MSP regime will automatically go away and farmer can expect a rightful price for the produce.
 - To ensure India becomes “Global Hub for Food Industry”

Measures needed

- **Ending APMC monopoly:** States must implement the Model APMC act and follow the precedent set by Maharashtra in this regard.
- **Creating Market Infrastructure**
 - **Physical integration:** Railroad expansion changed the landscape of agricultural markets in USA.
- **Transport and storage infrastructure for perishables:** Transport of perishable commodities in Reefer trucks & freight subsidy would help in better supply and availability of the produce.
- At present, India’s cold storage capacity is nearly 3.5 cr tonnes, short by 30-40 lakh tonnes, and it needs to be increased.
- **Kisan Rail and Kisan Udan** in Budget 2020 are steps in the right direction.
- **Setting up Farmer Producer Organizations and Cooperatives:** It would provide better avenues for pooling of resources to small and marginal farmers. It could also act as a direct marketing channel to supply produce from ‘surplus’ regions to high demand states
- **Nation-wide Price Dissemination Mechanism:**

- Forward Market Commission (FMC) has set up e-portal AGMARKNET that displays real time wholesale price of agricultural commodities on e-portal connected with APMC markets, Kisan mandis, Kisan Vikas Kendras (KVKs), State Agricultural Boards etc.
- Steps must be taken to ensure farmers are benefitted from the scheme.

Conclusion

With agriculture employing nearly half the Indian population even today, it is necessary to implement structural reforms to enhance Agri-value chain. To achieve the ambitious target of doubling farmers income by 2022, productivity and efficiency of value chain in agriculture the key. It will also protect the farmers against shocks and provide food security.

A comprehensive reform process in agriculture would start with a constitutional amendment that makes agriculture and water (use) a concurrent subject in the Constitution. Do you agree? Examine. (250 words)

Times of India

Why this question:

The question examines the importance of making agriculture and water use a concurrent subject from the current status of being in the State list.

Key demand of the question:

Discuss the significance of agricultural reforms in the country and explain what steps need to be taken in this direction. Examine what changes and prospects do transferring the subject of agriculture from State to concurrent will have.

Directive:

Examine – When asked to ‘Examine’, we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Briefly highlight agri scenario in the country – Agriculture is the most important sector of Indian Economy. Indian agriculture sector accounts for 18 per cent of India’s gross domestic product (GDP) and provides employment of around 50% of the countries workforce.

Body:

Discuss that India is the world’s largest producer of pulses, rice, wheat, spices and spice products. India has many areas to choose for business such as dairy, meat, poultry, fisheries and food grains etc.

Explain that a comprehensive reform process in agriculture would start with a constitutional amendment that makes agriculture and water (use) a concurrent subject in the Constitution—there has been precedent for this in the 42nd Amendment of 1976.

The purpose of this amendment would be to provide a federal fillip to states, with a primary emphasis on water effectiveness.

This water effectiveness project will not only focus on bringing more areas under irrigation in a sustainable manner (not with capital but with a thoughtful district by district approach) but also focus on sprinkler and drip irrigation.

Conclusion:

Conclude with way forward.

Introduction:

Agriculture is a state subject, i.e. it forms a part of the state list of our Constitution, which essentially means that states are supposed to address all the issues related to agriculture. The schemes introduced by Center for agriculture have failed time and again due to poor implementation and making the scheme selection optional for states.

Body:

The reason for making agriculture, a state subject:

- Subjects in the state list are the ones considered to **require local knowledge**.
- With our varied agro-climatic zones and cropping patterns, every region was then assumed to have geography-specific agricultural issues.

State schemes are more preferred over central schemes:

- The major stand-out features of state-run schemes are its penetration and acceptability.
- In its first year for Kharif 2017, close to 50% of area under Soyabean (major crop in MP) was covered under the Bhavantar Bhugtan Yojana.
- As per a NITI Aayog report, Karnataka farmers realised 38% more incomes in FY16 from the sale of agri-commodities through the state's e-trading platform.
- Many of the schemes also became the guiding lines for schemes announced by the Central government on the national level. Price deficiency Payment Scheme (PDPS), a part of the umbrella scheme PM-AASHA, was inspired by MP's Bhavantar Bhugtan Yojana.
- Karnataka's electronic market led to the idea of the e-NAM scheme implemented nationwide. Gujarat's soil health card scheme was taken on the national level in 2014.
- And now to solve the overarching problem of agrarian distress, the Central government is studying Telangana's income support scheme for national implementation.

Current performance of agriculture as a state subject:

- In MP, majority of Soyabean farmers had voluntarily registered themselves for **the Bhavantar Bhugtan Scheme**. A stark contrast to other national level schemes assessed, wherein the registrations were done by government officials on behalf of farmers, sometimes even without the knowledge of the farmers.
- In the online market of Mysore division, Unlike the **national level e-NAM, actual inter-state online transactions** were being conducted successfully in these markets.
- The assessment of the national soil health card scheme showed that farmers had responded with better utility for **soil health cards under the state-run scheme**. Most soil health card holders interviewed responded negatively for their usage under the national scheme.

The need for making agriculture and water a concurrent subject:

- Over the years, agriculture has definitely emerged as more than a state subject
- However, logically speaking – unless it is officially transferred to the Union list or more sensibly to the Concurrent list, agricultural problems should also have state developed solutions.
- But it has always been the central government which took the lead in designing reforms for the sector.
- The major beneficiaries of agricultural reforms – farmers – perceive more value from state-run schemes.
- It is thus essential, that agricultural reforms become a two-way street.

- The Central government downloading knowledge of state run-schemes for national implementation is definitely one approach.
- In addition, enhanced financial support to states implementing effective agri-reforms would also prove beneficial.
- The ministry of agriculture's proposed 'ease of doing agri-business' index can be a good parameter for assessing states on agri-reforms.

Conclusion:

The need of the hour is to make the Centre and state governments to work together as a coalition to tide over the issues of agriculture.

Briefly discuss the prospects of Food processing industries in India. Elaborate on the challenges it is facing and suggest way forward to encash its true potential. (250 words)

[Invest India](#)

Why this question:

The question is straightforward and doesn't require much deliberation.

Key demand of the question:

Discuss in detail the objectives, scope and significant prospects of Food processing Industry in the country.

Directive:

Elaborate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Explain first what Food Processing is.

Body:

Food Processing includes process under which any raw product of agriculture, dairy, animal husbandry, meat, poultry or fishing is transformed through a process (involving employees, power, machines or money) in such a way that its original physical properties undergo a change and the transformed product has commercial value and is suitable for human and animal consumption. Present the status of FPI in India and then List down the significance. Explain the possible potential that can be harnessed in this sector. Discuss the govt. initiatives in this direction.

Conclusion:

Conclude that Food processing has numerous advantages which are specific to Indian context. It has capacity to lift millions out of poverty and malnutrition. Government should develop industry in a way keeping in mind the interests of small scale industry along with attracting big ticket domestic and foreign investments.

Introduction:

Food processing has an important role to play in linking Indian farmers to consumers in the domestic and international markets. The Ministry of Food Processing Industries (MoFPI) is making all efforts to encourage investments across the value chain. Major industries constituting the Food processing industry are grains, sugar, edible oils, beverages and dairy products. Food & Grocery retail market in India further constitutes almost 65% of the total retail market in India.

Body:

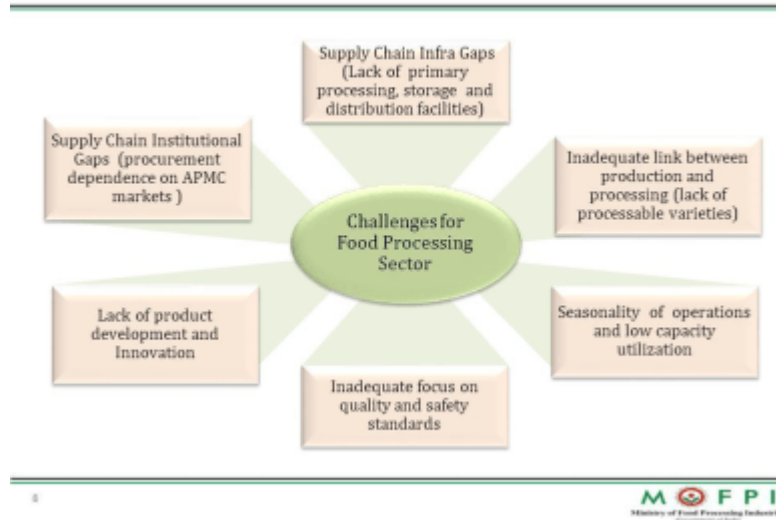

prospects of Food processing industries in India:

- The Food & Grocery market in India is the sixth largest in the world.
- The Processed food market is expected to grow to \$ 543 bn by 2020 from \$ 322 bn in 2016, at a CAGR of 14.6%.
- The industry engages approximately 1.85 mn people in around 39,748 registered units with fixed capital of \$ 32.75 bn and aggregate output of around \$ 158.69 bn.
- The government has sanctioned 40 Mega Food Parks (MFPs) to be set up in the country under the Mega Food Park Scheme. Currently, 17 Mega Food Parks have become functional.

Issues food processing industry is facing:

Food Processing Sector- Impediments

- **Supply chain issues:**
 - high cost of raw material (driven by low productivity and poor agronomic practices)
 - Presence of intermediaries and APMC acts make it more complicated.
 - high cost of packaging, finance, transport and distribution
 - lack of organized retail
- **Logistics cost:**
 - Logistics cost is high for transportation, warehousing, material handling etc.
 - In India, Logistics accounts for about 13% of GDP, which translates to over USD130 billion.
 - This cost is significantly higher as compared most developed countries.
- **Economic issues:**
 - In India, the food processing industry is highly fragmented and is dominated by the unorganized sector
- **Inadequate infrastructure:**
 - The inadequate support infrastructure which is the biggest bottleneck in expanding the food processing sector, in terms of both investment and exports includes:

- long and fragmented supply chain
 - inadequate cold storage and warehousing facilities
 - Inadequate road, rail and port infrastructure.
 - lack of modern logistics infrastructure such as logistics parks, integrated cold chain solutions, last mile connectivity,
- **Political issues:**
 - Absence of Comprehensive national level policy on food processing sector: The food processing sector is governed by statutes rather than a single comprehensive policy on food processing. India urgently needs a national food processing policy which incorporates tax breaks for the sector.

Measures needed to plug supply side and infrastructure bottleneck:

- Foster development of backward linkages by evolving conducive regulatory framework for contract and corporate farming
- The North Eastern Region, the Hilly States (J&K, HP and Western UP), the Islands (A&N, Lakshadweep) areas in the country should be given special consideration as they are naturally conducive for Food Processing Industries.
- Encourage commodity clusters and intensive livestock rearing.
- Promote private sector participation with well-defined roles of the participants, risk sharing mechanisms, fiscal incentives and partnership models for creation of infrastructure for logistics, storage and processing
- Encourage technology up gradation of existing facilities and investment in development of ancillary industries like research and development, packaging, food processing equipment manufacturing, food safety certifying agencies by extending fiscal incentives to investors.
- Enable better access to credit by augmenting current cap of Rest 10 crore investments in plant and machinery to qualify as Priority Sector Credit to accommodate the high cost technology adoption and scale enhancement
- **Streamlining the regulatory structure:**
 - Remove impediments of multiple departments and laws in seeking approvals by bringing them under a single window.
 - Ensure uniform implementation of the APMC act to encourage private sector investment in infrastructure development.
- **Change in mind set -Orienting stakeholders towards 'demand and profit driven production'**
 - Participants across the agri value-chain need to shift their focus from trying to market 'what is produced' to producing 'processable varieties and marketable products' meeting global quality standards and traceability requirements, duly adopting need based viable technologies and quality controls.
- **Human resource development-to meet increasing demand for skilled manpower:**

- Stimulate industry, academia and government to put in combined efforts for development of specialized institutes and courses for providing training on managerial, safety and enforcements, technology and production, warehousing and distribution aspects.
- Encourage State Agricultural Universities to commence courses in food packaging, processing, bio-technology, information technology in agriculture and such allied fields

Conclusion:

India's food ecosystem offers huge opportunities for investments with stimulating growth in the food retail sector, favourable economic policies and attractive fiscal incentives. The need of the hour is to adopt an integrated approach to address the above mentioned tailbacks with a clear-cut focus on improving the quality and value of the output, reducing the cost of raw material for the processors, while improving the farmers' income levels. To promote this sector, attempts are required to be made to promote farmer-producer interaction, provide appropriate tax incentives and holidays for setting up food processing industries, taking care of expenses on market promotion and ancillary activities.

Inspect role that supermarkets play in supply chain management of horticulture products. How do they eliminate the issue of intermediaries? Discuss. (250 words)

[The Hindu Business Line](#)

Why this question:

The question is based on the significance of supermarkets and the role played by them in SCM of horticulture products.

Key demand of the question:

Discuss the significance of Supermarkets in SCM of agri products and produce, suggest where India stands in this aspect and what more is required to be done.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Fruits and Vegetable (FFV) are one of the most important components of a retail chain (supermarket). It acts as a strategic product in attracting the customers. Agri-food produces from the farmer's field reach the end consumer through a long chain of intermediaries such as farmers/growers, cooperatives, wholesalers, retailers, commission agents, etc.

Body:

Discuss the role of supermarkets in the supply chain:

The concept of agri-supply chain refers to the activities of procurement, order fulfillment, distribution, delivery and customer service executed by two or more separate organizations in the agribusiness industry.

Agrisupply chain consists of small and medium enterprises.

Supply chain collaboration has become the prerequisite for successful procurement and operational business practices for perishable products with the emerging trends of globalization and competitive marketplace.

Supply chain planning in the agri-food industry integrates the complex network of farmers, demand, and supply to end consumers to enhance operational effectiveness.

Discuss its significance to Indian agri systems.

India is one of the leading producers of vegetables, fresh fruits and a number of food items. Marketing of fruits and vegetables especially is more challenging than many industrial products because of their perishability, seasonality and bulkiness. A supermarket is a self-service shop offering a wide variety of food and household products.

Explain challenges and issues if any and what way they can be addressed.

Conclusion:

Conclude with way forward.

Introduction:

Fruits and Vegetable (FFV) are one of the most important components of a retail chain (supermarket). It acts as a strategic product in attracting the customers. Agri-food produces from the farmer's field reach the end consumer through a long chain of intermediaries such as farmers/growers, cooperatives, wholesalers, retailers, commission agents, etc.

Supermarkets play a very important role in supply chain management of fruits, vegetables and food items. Supermarket chain such as SAFAL, Reliance Fresh, Easy Day, Big Basket, TESCO etc. provide backward as well as forward linkage in the supply chain

Body:

As part of supply chain, the **retail chains (supermarkets) respond to upstream-side demand and absorb downstream-side risks** with the objective to augment, retain, satisfy consumers and gain new revenue opportunities without the creation of excess inventory or capacity.

Role of supermarkets in the supply chain:

- The concept of agri-supply chain refers to the activities of procurement, order fulfilment, distribution, delivery and customer service executed by two or more separate organizations in the agribusiness industry. Agrisupply chain consists of small and medium enterprises.
- Supply chain collaboration has become the prerequisite for successful procurement and operational business practices for perishable products with the emerging trends of globalization and competitive marketplace.
- Supply chain planning in the agri-food industry integrates the complex network of farmers, demand, and supply to end consumers to enhance operational effectiveness.
- Super markets have eliminated the middleman in the distribution channel which reduces the amount of logistics and transportation required in the movement of goods from manufacturer to consumer. This increases efficiency significantly.
- Manufacturers, for instance, can skip wholesalers and more quickly replenish retailers with stock. Additionally, companies can offer products and websites and quickly ship them to consumers following the purchase.

Measures for increasing efficient of supply chain:

- There is a need for backward linkage with the farmer via contract farming
- The retail stores have to be organised in a structured way for an efficient distribution of products.
- There is a need for more cold storages so as to reduce losses due to spoilage.
- The APMC Act at the state level needs to be amended.

Conclusion:

Reducing intermediaries helps consumer in getting quality agriculture produce at less price. It helps farmer in getting better and assured return for their produce. It helps in increasing income of agricultural household thus reducing rural – urban migration, it also prevents farmers from falling into trap of informal moneylenders. Thus streamlining the supply chain either by supermarket or by cooperative not only helps in reducing intermediaries but also helps in bringing prosperity to rural community.

The recent Onion crisis is the result of market inefficiencies, weak supply chains and monopolies in the market. Analyse and suggest solutions to the above problem. (250 words)

Business Standard

Why this question:

The question is in the current context of fluctuating onion prices in the economy.

Key demand of the question:

Discuss in detail the underlying causes of such price fluctuations owing to market inefficiencies, weak supply chains and monopolies in the market.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

The onion – ubiquitous in Indian cooking – is widely seen as the poor man's vegetable.

Body:

Discuss the causes of such fluctuation – like a drop in supply, due to heavy rains and flooding destroying the crop in large parts of India etc. are common that reason out to contribute to the price instability. Discuss the concerns associated with market inefficiencies, weak supply chains and monopolies in the market.

Explain what needs to be done? Suggest solutions such as – grass-root planning and better storage facilities and food processing services will ease the problem – and making a variety of cash crops and vegetables available across the country would also ease the pressure on onions.

Conclusion:

Conclude with way forward.

Introduction:

Onion prices, which have quite frequently seen a steep increase in the post-monsoon season in recent years, normally subside by November. But this year, the high prices linger on and there is no sign of normalisation anytime soon. Though this can partly be attributed to the monsoon-driven delay in the sowing and harvesting of the kharif onion crop, the alarm and scarcity psychosis created by the government through its ill-advised and mistimed market interventions are also to blame.

Body:

Reasons for Onion price rise:

- The root cause of the recurring onion crisis is the disregard of the reality that while the demand for onions persists the year-round, its supply is seasonal.
- India, in a way, is fortunate to be able to grow onions thrice a year — in the early kharif, late kharif and rabi seasons. The produce of these crops feeds the market between November and June.
- The period from July to October is usually the lean season when fresh supplies are not available and the market needs to be fed from the stored stocks.

- Therefore, the most critical aspect of supply management is the safe upkeep of the surplus produce for the lean period.
- Unfortunately, this is generally disallowed as storage is viewed negatively as hoarding for profiteering.
- There is, no doubt, only a thin line between storage and hoarding but this distinction needs to be realised at least in the case of onions.
- The government's ill-advised actions like imposition of stock limits under the Essential Commodities Act and raids on those maintaining large inventories deter traders as well as farmers from retaining the surplus produce for subsequent release.

Measures needed:

- For stabilising retail prices of fresh TOP, and ensuring a higher share of the consumer's rupee to farmers, policy makers need to focus on three things.
- **First, Ample storage for buffer stocks has to be created:**
 - While potatoes and onions can be stored, repeated stocking limits on onion traders discourages private investments in modern cold storages.
 - For inviting large private investment in storages, the Essential Commodities Act has to go.
 - If the government feels that traders are colluding to rig the market, then the Competition Commission of India should look into it.
 - The government banning exports or imposing stocking limits is not a solution.
- **Second, Increase processing capacities for TOP:**
 - Since buffer stocking for tomatoes is not possible, processing remains the only solution.
 - For this, the GST for tomato puree and juice should be reduced from 12 per cent to 5 per cent. Milk and most milk products attract 0 to 5 per cent GST.
 - To propagate the use of processed products (tomato puree, onion flakes, powder) among urban and bulk consumers (hospitals, schools, armed forces), the government should run campaigns in association with industry organisations, as was done for eggs.
 - Most of the advanced countries use large quantities of processed tomatoes and onions, which can be stored conveniently.
 - India needs to have time bound targets to process and export at least 10-15 per cent of TOP production.
 - While India exports 10-12 per cent of onion production in fresh and dehydrated form, it exports less than 1 per cent of tomatoes and potatoes production.
- **Third, Buying directly from FPO's:**
 - Direct buying by organised retailers from farmer producer organisations (FPOs) through contract farming, bypassing the mandi system, should be encouraged.

- Like dairy cooperatives, TOP cooperatives and retail outlets like Safal across the country should be opened. With over 400 Safal outlets across Delhi-NCR, onions are being sold at Rs 25/Kg when retail prices are hovering between Rs 50-60/Kg.
- A similar thing could have been done for tomatoes. However, this will require value chain development starting with market reforms along with overhauling the infrastructure of existing APMC mandis in the country.
- With crumbling infrastructure, many APMC mandis are running over their capacity.
- Visit to the Kolar mandi, one of the largest tomato mandi in the country, spread over 20 acres, revealed that the operations of the mandi have spread to adjoining areas.
- For better functioning, it requires at least two to three times more land and much better infrastructure.

Way forward:

- Promote modern cold storages and develop a system similar to that of the warehouse receipt system for farmers.
- States must launch a concerted intelligence drive to crack down on hoarders and bring the stocks to the market swiftly.
- Encourage imports.
- Set up onion dehydrating units and promote demand for dehydrated onions amongst large consumers.
- More policy making and political attention should be devoted to raising onion output, or for that matter farm output in general. Complacency on the farm front is wholly avoidable.

Infrastructure: Energy, Ports, Roads, Airports, Railways etc.

What is National Infrastructure Pipeline? Elucidate upon the key benefits of National Infrastructure Pipeline (NIP) (250 words)

[Live mint](#)

Why this question:

The question aims to discuss the National Infrastructure Pipeline and its benefits.

Key demand of the question:

Discuss in detail the objectives, significance and contributions of such a project to the economy of the country.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

It is estimated that India would need to spend \$4.5 trillion on infrastructure by 2030 to sustain its growth rate. The endeavor of the National Infrastructure Pipeline (NIP), is to make this happen in an efficient manner.

Body:

Discuss that NIP will enable a forward outlook on infrastructure projects which will create jobs, improve ease of living, and provide equitable access to infrastructure for all, thereby making growth more inclusive.

NIP includes economic and social infrastructure projects.

Explain in what way such infrastructure projects would ensure ease of living: safe drinking water, access to clean and affordable energy, healthcare for all, modern railway stations, airports, bus terminals and world-class educational institutes etc.

Conclusion:

Conclude that Infrastructure investment has a special role to play as it aids to revive economic activities.

Introduction

To achieve the GDP of \$5 trillion by 2024-25, India needs to spend about \$1.4 trillion (Rs. 102 lakh crore) over these years on infrastructure. The objective of NIP is to create bouquet of well-prepared projects would attract investment from Central and State Governments, Urban Local Bodies, Banks and Financial Institution, PE funds, and private investors, both local and foreign.

- The NIP has projected total infrastructure investment of Rs. 102 lakh crore during the period FY 2020 to 2025 in India.
- NIP is expected to enable well-prepared infrastructure projects which will create jobs, improve ease of living, and provide equitable access to infrastructure for all.

Body

Key Benefits of NIP

- **NIP includes both economic and social infrastructure** projects.
 - Economic infra includes: Roads, energy, railways, shipping, steel etc.
 - Social infra includes: Education, health, sports etc.
- **Sustaining the Virtuous Cycle:** Economic Survey 2019 argues that growth can be sustained by a virtuous cycle approach where investment is the key driver that drives demand, creates capacity, increases labour productivity, improve ease of living, generates jobs etc.
 - **NIP** is prepared as a pipeline of projects based on viability and cost considerations to enable such investments.
- **Employment Generation:** Going ahead, share of urban employment will be higher than rural employment. To sustain this, infrastructure under NIP will be vital in the coming years.
- **Increasing urbanization:** 42 per cent of population is expected to live in urban areas in 2030 as opposed to 31 per cent now. Infrastructure to provide transport, housing, public spaces are vital for human development. This will be addressed by NIP.
- **Reviving the economy:** According to the latest estimates, the Indian economy will grow at 5% in the current fiscal year ending March. The growth projected is slower than the 6.8% recorded in 2018-19. In the quarter that ended in September 2019, growth had hit a six-year-low at 4.5%.
 - **NIP** will help in reviving the investment cycle and spur growth through capital formation.
- The **greenfield and brownfield projects** are across power, urban development, irrigation, mobility, education, health, water and digital sectors across 18 states and Union territories.

Challenges

- **Fiscal constraint:** In FY 2019, India's total infrastructure investments were about Rs. 10 lakh crores only. And given the challenges like high debt-to-GDP ratio, fiscal deficit and increasing twin balance sheet problem, it would be very tough to finance these projects.
- **Bank Credit:** Infrastructure financing is the cause of a major part of the bad loans in banks. So, banks would be apprehensive to finance such a large scale of investment.
- **Cooperation from States:** Centre and the states have to work together to sort issues like land acquisition and environmental clearances which have imposed huge time and cost delays on several key projects nationally.
- **Lack of new projects:** About 42% of identified projects under NIP are already under implementation, 19% are under development.

Conclusion

The road map for infrastructure creation has never been easy. The answer possibly lies enhancing private investment through a combination of measures like credit enhancement which is conditional upon specific reforms in areas like user- charges, land aggregation & monetization, deepening of municipal bond markets among others.

Will natural gas play the game-changer in India's energy future? Discuss. (250 words)

The Hindu

Why this question:

A study to facilitate the development of a national gas grid is to be undertaken soon by a U.S. entity for the Petroleum and Natural Gas Regulatory Board (PNGRB). Thus the question.

Key demand of the question:

Discuss the prospects of Natural gas and in what way it can be a game changer in India's energy future.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly provide facts for Natural gas scenario in the country.

Body:

Globally, natural gas constitutes 24 per cent of the primary energy consumption. In India, Gujarat, which has relatively better access to natural gas, is having a share of 25 per cent in its energy basket. The government proposes to increase the share of natural gas in the whole of its energy consumption to 15 per cent by 2020.

Discuss the prospects in detail. Use a map to pictorially represent the resource availability in the country.

Explain the challenges posed by the industry.

Discuss the efforts of the government in this direction.

Conclusion:

Conclude with way forward.

Introduction:

Natural gas is a superior fuel as compared with coal and other liquid fuels, as it is environment friendly, safer and cheaper fuel. It can be supplied through pipelines and hence, there is no need to store cylinders in kitchen and thus saves space. It is environment friendly fuel and its usage as domestic kitchen fuel, as fuel for transport sector as well as fuel for industries and commercial units can play a significant role in reducing carbon emission. It is 60% cheaper compared with petrol and around 45% cheaper when compared with Diesel. A study to facilitate the development of a national gas grid is to be undertaken soon by a U.S. entity for the Petroleum and Natural Gas Regulatory Board (PNGRB).

Body:

Globally, natural gas constitutes 24 per cent of the primary energy consumption. In India, Gujarat, which has relatively better access to natural gas, is having a share of 25 per cent in its energy basket. The government proposes to increase the share of natural gas in the whole of its energy consumption to 15 per cent by 2020.

Current scenario:

- Currently, share of natural gas in India's energy mix is just over 6% and aim is to reach 15% figure for moving towards gas based economy, while world average is 24%.
- The natural gas pipeline network in India totalled 16,324 km as on April 2019, according to official figures.
- Nearly 7,000 km of pipeline is under construction.
- In addition, the CGD projects, to supply the environment-friendly and cost-effective fuel to commercial, industrial and residential users, will see several thousand more kms of steel pipeline getting added.
- Share of natural gas in India's energy basket is 6.2% as against 23.4% globally and is expected to increase.

Potential of natural gas as a game changer:

- India aims to bring down its carbon emission level and number of initiatives have been taken in this direction such as BS VI fuel, bio-energy, LED bulbs, International Solar Alliance (ISA), Pradhan Mantri Ujjawala Yojana and providing clean piped gas supply to more cities.
- India is also enhancing LNG terminal capacity, renegotiating Indo-Qatar Gas deal and encouraging positive Indo-US engagement in this direction.
- It is not only focussing on increasing use and supply of gas, but also on producing gas through agro-wastes and other products and including same into City Gas Distribution (CGD) network.
- It has also increased its focus on promoting the usage of environment-friendly clean fuel, natural gas as fuel and feedstock across country to move towards gas based economy.
- The National Gas Grid together with providing gas connections to households will provide better infrastructure for automobiles using gas.
- The National Gas Grid will also aid in renewing of the fertilizer sector and also give a boost to the Power and Automotive sector

Conclusion:

It is good that the gas network is being laid but it also depends on the consumers to pay for the pipeline connection. The government is doing well by fixing the City Gas Distribution network and simultaneously extending the pipeline infrastructure. But the limits of this outreach will depend on India's limits to be able to import those quantities of gas in terms of availability of exchange in times

to come. To some consumers, gas could be a bridge fuel before they move on to electricity for clean cooking.

Briefly discuss the pros and cons of the idea of privatizing the Indian Railways (250 words)

The Hindu

Why this question:

The question seeks to examine the aspects of privatizing the Indian Railways services.

Key demand of the question:

Discuss in detail the opportunities and obstacles that the idea of privatizing Railways pose.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Highlight the idea of Privatization in general and the perks it carries with it.

Body:

Start with – The Bibek Debroy Committee, which was set up to suggest ways to mobilize resources for the Indian Railways and restructure the Railway Board, has favored privatization of rolling stock: wagons and coaches.

Discuss the positives of such a move – Improved Infrastructure, Balancing Quality of Service with High Fares, better accountability etc.

Explain the challenges associated.

Discuss why India right now cannot afford privatization of Indian Railways.

Conclusion:

Conclude with way forward.

Introduction:

Post privatisation of the Tejas Express (to be run by the IRCTC), the government is currently in the process of forming a task force to draw a blueprint for handing over operations of as many as 150 trains and a total of 50 railway stations to private operators. The Bibek Debroy committee recommended that the rail industry needs to be liberalized by allowing the entry of private operators to provide services.

Body:

Pros of privatization of Indian railways:

- **Improved Infrastructure:** Privatisation will lead to better infrastructure which in turn would result in improved amenities for travellers.
- Currently, Indian Railways is marred by mismanagement in the form of stinking washrooms, lack of water supply and dirty platforms, it is expected that a private company will ensure better amenities.
- **Normalization of prices** due to the competition: Improvement in quality of services has to be matched up by a rise in charges paid by the travellers.
- However, the issue of price rise will be solved when private players are allowed to enter the sector since the move would foster competition and hence lead to overall betterment in the quality of services.
- **Improved Security:** Private participation can lead to better accountability and monitoring, which can keep a check on rising accidents in railways.

- **Better Technological Innovation:** Private participation can lead to the infusion of modern technology and capacity building of Indian railways.

Cons of Privatisation of Indian Railways:

- **Limited Coverage:** An advantage of Indian Railways being government-owned is that it provides nation-wide connectivity irrespective of profit.
- Privatisation of railways would mean the railways will become a profit-making enterprise, this would lead to the elimination of railways routes that are less popular.
- Thus, the privatisation of railways can have a negative impact on connectivity and further increase the rural-urban divide.
- **Lesser Inclusive:** Hike in fares can render the railways out of reach for lower-income groups.
- Issue of Accountability: The privatisation of Indian Railways is not easy, as it covers every part of India and runs for 24×7 hours.
- The whole railway system cannot be handled by a single party or coordination will be very difficult if area wise given to private parties.
- **Impact on the Economy:** Indian Railways is the backbone of India, it provides low fare transportation to agricultural and industrial trade.
- Therefore, privatisation of Indian railways shall definitely affect the Indian economy at large.
- It is difficult to privatize a portion of the railways' operations as it is strongly vertically integrated.
- Vertical integration of railways means ownership and maintenance of the rail and associated infrastructure; all is vested under the Ministry of Railways.
- The strong worker unions of Indian Railways need to be convinced. This could be a herculean task.
- Any untoward incidents like accidents can cause greater government scrutiny and create regulations which may affect performance or efficiency.
- Regulations must ensure level playing field for all players and relevant stakeholders.
- Competition from other modes of transport can affect private railway revenues. This could give rise to crony capitalism.

Way forward:

- Privatisation of railways operations will require a new institutional framework where infrastructure will remain as a government's monopoly while there would be a market of service providers.
- It is important to modernize the railways, so measures must be taken to reimburse the social costs speedily so that resources of the railways is better allocated and facilities are upgraded from time to time.
- Core Railways functions can be Corporatized rather than privatized.
- Corporatization refers to the restructuring or transformation of a state-owned asset or organization into a corporation. These organizations typically have a board of directors, management, and shareholders.
- However, unlike publicly traded companies, the government is the company's only shareholder, and the shares in the company are not publicly traded.
- The peripheral function of railways (cleanliness, ticket disposal, traveller's amenities), must be privatized.

Science and Technology- developments and their applications and effects in everyday life; Achievements of Indians in science & technology; indigenization of technology and developing new technology.

Analyse the probable impact of frontier technologies on developing countries.(250 words)

[Live Mint](#)

Why this question:

The article explains the fact that Frontier technologies are set to transform people's lives, and developing nations must harness this revolution. But there is a danger that the gains will not reach the world's poorest.

Key demand of the question:

One must provide for a detailed analysis of the probable impact of frontier technologies on developing countries.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

The rapid technological transformations that started from the Industrial Revolution to the digital revolution, have boosted economic performance, improved efficiency, accelerated the pace of globalization, and transformed human society in the process.

Body:

Explain that Frontier Technology or Industrial Revolution 4.0, the latest wave of disruptive technological change is fundamentally altering how goods, services and ideas are exchanged. However, the disruptive nature of technology is nothing new, and it offers promising new opportunities, while at the same time posing a challenge to policymaking.

Discuss in detail what are frontier technologies and their applications.

Explain the associated challenges in detail.

Specifically discuss the case with developing countries; The Pathways for Prosperity Commission on Technology and Inclusive Development has shown that developing countries can still harness the new wave of frontier technologies for the benefit of all.

Conclusion:

Conclude with way forward.

Introduction:

Frontier technologies are defined as potentially disruptive technologies that can address large-scale challenges or opportunities. Frontier technology is the next phase in the evolution of modern technology. It is the intersection where radical forward-thinking and real-world implementation meet. For example AI, robotics, 3D printing, and the Internet of Things, etc. Frontier Technology or Industrial Revolution 4.0, the latest wave of disruptive technological change is fundamentally altering how goods, services and ideas are exchanged.

Body:

Impact of frontier technologies on developing countries:

Positives:

- Frontier technologies have unlocked new routes to prosperity through agriculture, manufacturing, trade in services, the linking of informal and formal sectors, and domestic interconnectivity.

- They have enormous potential to improve government administration and the delivery of public services.
- They can help anticipate and respond to the effects of climate hazards and air pollution through the adoption of state-of-the-art technologies to address environmental impacts.
- In the Republic of Korea, the smart city of Songdo is built around the Internet of Things to reduce traffic pollution, save energy and water, and create a cleaner environment.
- It will be critical that these technologies work for society and the environment as well as the economy if the world is to achieve the ambitions of the 2030 Agenda for Sustainable Development.

Challenges posed by frontier technologies:

- Digital Exclusion:
 - As Information and Communication Technology infrastructure is the backbone of many frontier technologies, there is a risk of its triggering a new frontier technology divide, compounding an already existing digital divide.
 - An estimated three billion people could still lack internet access by 2023, and many more will have little or no opportunity to reap the benefits of digital technologies.
 - There is a danger that gains associated with frontier technologies will not reach the world's poorest people.
- Uncertain Future of Work:
 - In the coming decades, the jobs of 785 million workers, that's equivalent to over 50 % of total employment in the Asia-Pacific region could be automated.
- Trust and Ethical Questions:
 - Frontier Technology per se is not the problem, but there are ethical issues surrounding privacy, ownership and transparency.
 - With the world's population projected to reach ten billion by mid-century, global governance will become even more complex than it is today.
- Developing countries, in particular, are starting from a difficult position, because they are already grappling with the challenges of low human capital, ineffective institutions, and a difficult business environment.

Conclusion:

The Pathways for Prosperity Commission on Technology and Inclusive Development has shown that developing countries can still harness the new wave of frontier technologies for the benefit of all.

Way forward:

- An inclusive ICT infrastructure.
- A workforce fit for the emerging scale and speed of the technological revolution.
- In this context, there is a need to promote lifelong learning, reskilling and entrepreneurship development to develop a cadre of job creators.
- A policy framework to strengthen public-private partnerships, so as to capture the benefits of the Fourth Industrial Revolution.

- A responsive and adaptive regulatory framework that doesn't stifle innovation.
- Whole-of-economy or Most-of-society approach: Technology alone will not guarantee success. Policymakers must also account for local contexts and conditions so that they can create social, political and economic ecosystems in which technology creates jobs and drives inclusive growth.
- National governments should start planning for digital readiness in four areas: infrastructure, human capital, policy and regulation, and finance.

What do you understand by a civic technology? Discuss in what way they can pave the way towards more progressive and democratic political systems.(250 words)

[Live Mint](#)

Why this question:

The question is based on the concept of Civic technologies.

Key demand of the question:

Discuss in detail what you understand by civic technologies and how they can pave the way towards more progressive and democratic political systems.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define what a civic technology is.

Body:

Civic technology, or civic tech, enhances the relationship between the people and government with software for communications, decision-making, service delivery, and political process. It includes information and communications technology supporting government with software built by community-led teams of volunteers, nonprofits, consultants, and private companies.

Take queues from the article and explain how they can lead to more progressive and democratic political systems.

Conclusion:

Conclude with significance, discuss that civic technology focuses on improving the daily lives of individuals, making the society more equitable and improving the efficiency of organizations such as the government.

Introduction:

Civic technology, or civic tech, enhances the relationship between the people and government with software for communications, decision-making, service delivery, and political process. It includes information and communications technology supporting government with software built by community-led teams of volunteers, non-profits, consultants, and private companies.

Body:

In the Indian context, civic technology can broadly be divided into two themes—**tools aimed at improving civic engagement**, and **those directed at streamlining government services**.

Civic technology can lead to progressive and democratic political systems:

- Civic technology solutions enhance the relationship between people and government, by giving people more of a voice to participate in public decision making and/or to improve the delivery of services usually by government to people.
- These technologies can be developed by either non-profit organizations or for-profit companies, or even by government itself.

- Civic technology solutions are not restricted to urban local bodies or to citizen-driven initiatives.
- Because of the conveniences provided by civic technology, there are benefits as well as growing concern about the effects it may have on social behavior and civic engagement.
- New technology allows for connectivity and new communications, as well as changing how we interact with issues and contexts beyond one's intimate sphere.
- Civic technology affords transparency in government with open-government data, and allows more people of diverse socioeconomic levels to be able to build and engage with civic matters in a way that was not possible prior.
- For instance, OnlineRTI streamlines the process of applying for and receiving information from the government under the Right to Information Act.
- Regarding elections and online polling, there is the potential for voters to make less informed decisions because of the ease of voting.
- The seeds of civic technology in India were sown as early as 2012, when **ICChangeMyCity** enabled citizens to share complaints about civic issues through its platform.
- It also provided municipalities with real-time grievance data to resolve.
- Building on this, organizations such as Reap Benefit, through their online platform, work with young people to create solutions for civic problems such as low-cost sanitation systems from discarded plastic.

Way forward:

- To make the 2020s the decade of civic technology in India, entrepreneurs can work to create diversified business models and build robust impact assessment frameworks for their organizations.
- Governments can continue to work with and encourage civic-technology platforms through startup competitions and partnerships.
- Investors and philanthropists have the opportunity to craft innovative funding models to fuel growth.
- Organizations working to support civic tech in India like D-Prize, Omidyar Network, Rohini Nilekani Philanthropies and Village Capital are already paving the way.

Conclusion:

The promise of civic technology, broadly defined here as new, lower-cost technologies or platforms meant to facilitate citizen feedback, foster government accountability, and create an iterative relationship between the two. In India, a growing number of internet users is coupled with a young population, accustomed to demanding participation in all facets of their lives, including greater participation in governance. This combination is pushing governments to be more participatory and efficient.

What do understand by Scientific social responsibility (SSR)? Discuss the need and significance of having a dedicated policy to ensure SSR is achieved in a right manner .(250 words)

[The Hindu](#)

Why this question:

Science outreach programme was on the agenda on the third day of the 107th Indian Science congress. Central government has a plan to launch a Programme on implementing scientific social responsibility (SSR).

Key demand of the question:

Telegram: <https://t.me/insightsIAStips>

Youtube: <https://www.youtube.com/channel/UCpoccbCX9GEIwaile4HLjwA>

Facebook: <https://www.facebook.com/insightsonindia>

Discuss in detail the aspects of SSR and its importance. Explain why the country needs a dedicated policy to ensure SSR is in place.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define what is SSR – The ethical obligation of knowledge workers in all fields of science and technology to voluntarily contribute their knowledge and resources to the widest spectrum of stakeholders in society.

Body:

Explain in detail the significance of SSR.

To encourage science and technology (S&T) institutions and individual scientists in the country to proactively engage in science outreach activities to connect science with the society.

To harness latent potential of the scientific community for strengthening linkages between science and society, and for making S&T ecosystem vibrant.

To develop a mechanism for ensuring access to scientific knowledge, transferring benefits of science to meet societal needs, promoting collaborations to identify problems and develop solutions.

Explain the need for a dedicated policy to ensure SSR is in place.

Discuss the highlights of the draft policy dedicated to SSR.

Conclusion:

Conclude with need and significance of SSR; When most research is being done by using taxpayers' money, the scientific establishment has an ethical obligation of "giving back" to the society. SSR is not only about scientific impact upon society but also about the social impact upon science. SSR would therefore strengthen the knowledge ecosystem and bring efficiencies in harnessing science for the benefit of society.

Introduction:

Scientific Social Responsibility (SSR) is the confluence of scientific knowledge with visionary leadership and social conscience. SSR is about building synergies among all stakeholders in our scientific knowledge community and also about developing linkages between science and society.

India is going to be possibly the first country in the world to implement a Scientific Social Responsibility (SSR) Policy on the lines of Corporate Social Responsibility (CSR). A draft of the new policy has been made available by the Department of Science and Technology (DST).

Body:

Highlights of the draft:

- Under the proposed policy, individual scientists or knowledge workers will be required to devote at least 10 person-days of SSR per year for exchanging scientific knowledge to society.
- It also recognises the need to provide incentives for outreach activities with necessary budgetary support.
- It has also been proposed to give credit to knowledge workers/scientists for individual SSR activities in their annual performance appraisal and evaluation.
- No institution would be allowed to outsource or sub-contract their SSR activities and projects.
- The draft defines SSR as "the ethical obligation of knowledge workers in all fields of science and technology to voluntarily contribute their knowledge and resources to the widest spectrum of stakeholders in society, in a spirit of service and conscious reciprocity".

- A central agency will be established at DST to implement the SSR. Other ministries would also be encouraged to make their own plans to implement SSR as per their mandate.

Need for SSR:

- The earlier S&T policies have also emphasised on the utilisation of science for welfare of the people.
- However, the new India with its vibrant young populace is a country of ambition and aspiration, requiring a renewed emphasis on the integration of S&T with society at both the institutional and individual levels.
- When most research is being done by using taxpayers' money, the scientific establishment has an ethical obligation of "giving back" to the society.
- SSR is not only about scientific impact upon society but also about the social impact upon science.
- SSR would therefore strengthen the knowledge ecosystem and bring efficiencies in harnessing science for the benefit of society.
- An institutional mechanism through SSR policy, facilitating easy access to resources and knowledge, would be a significant step in the right direction.
- This will have far reaching implications for the new initiatives such as Transformation of Aspirational Districts, Make in India, Swachh Bharat and Digital India, leading to inclusive growth and development.
- SSR would inculcate moral responsibility amongst scientific community which may trigger social entrepreneurship and start-ups impacting S&T ecosystem and society.
- This policy would strengthen the existing efforts of institutions in an organised and sustainable manner

Significance of SSR:

- Expanding the domain of science and its benefits to the community. Encouraging students into science through handholding and nurturing their interest.
- Creating an opportunity for cooperation and sharing of S&T resources in laboratories with other researchers in universities and colleges.
- Providing training for skill development and upgrading scientific knowledge.
- Helping MSMEs, Startups and informal sector enterprises in increasing their overall productivity. Facilitating scientific intervention in rural innovation.
- Empowering women, disadvantaged and weaker sections society through scientific intervention. Identification of best practices and success models on SSR for replication with multiplier effect in the country.
- Facilitating actions towards addressing Technology Vision 2035 Prerogatives and Sustainable Development Goals (SDGs) of the country such as water, ecology, health and livelihood.

Conclusion:

SSR envisages strengthening science-society linkages in an organic manner by building synergy among all the stakeholders so as to usher in a cultural change in the conduct of science for the benefit of society at large in the country.

Discuss the prospects and challenges posed by Blockchain technology; what opportunities does it have to offer to the social sectors in the country? Discuss. (250 words)

[News on Air](#)

Why this question:

The question aims to ascertain the applications of Blockchain technology and its aid to social sector. National Informatics Centre (NIC) has set up the Centre of Excellence (CoE) in Blockchain Technology in Bengaluru, Karnataka.

Key demand of the question:

Discuss the significance of Blockchain technology and its application.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly define Blockchain technology.

Body:

Blockchain technology is upcoming & niche technology and adoption of the same in sectors such as health, finance, agriculture and various other sectors would aid the government in implementing various programmes and provide trust and immutability to the assets.

Explain the applications of Blockchain technology, With National Informatics Centre (NIC) providing a robust and an agile infrastructure, the CoE shall also provide Blockchain as a Service (BaaS) for efficient hosting of Blockchain network.

Conclusion:

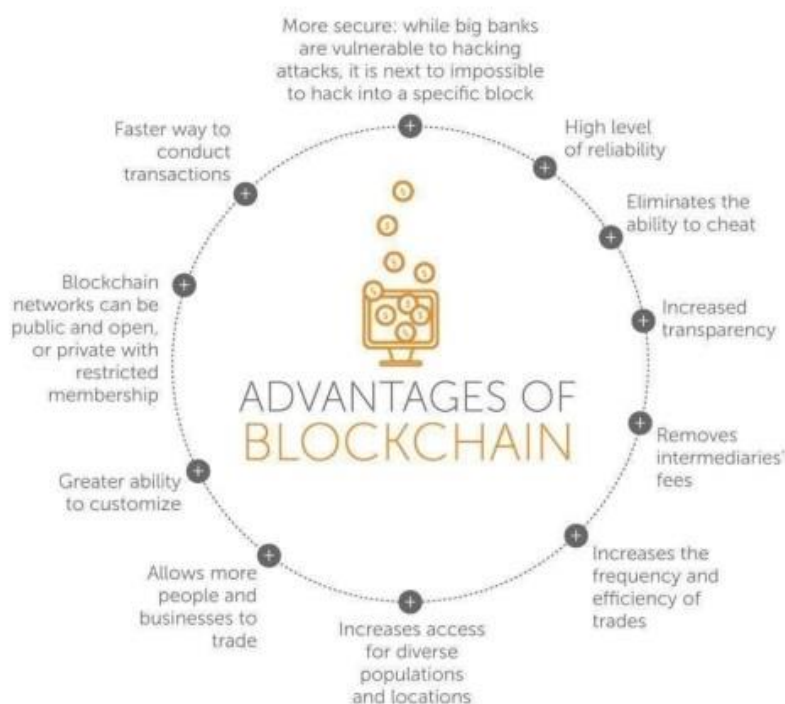

Conclude with futuristic advantages of Blockchain Technology.

Introduction:

Blockchains are a new data structure that is secure, cryptography-based, and distributed across a network. The technology supports cryptocurrencies such as Bitcoin, and the transfer of any data or digital asset. Anything recorded on them cannot be deleted, and is instantly uploaded to all users on that blockchain. Blockchain is being researched across the banking and financial services industries.

Body:

In Karnataka, Bengaluru has come up with a Centre for Excellence in Blockchain Technology. This technology helps in enhancing transparency and trust in e-Governance system by allowing all stakeholders benefit from shared learning, experiences and resources. Set up by the National Informatics Centre, the Centre for Excellence would help to bring a revolutionary change in the lives of the people by delivering e-governance services effectively through the data-centric model.

Prospects:

- Bitcoin is just one of the applications for the technology, whose use is being tested across industries.
- Healthcare, banking, education, agriculture, electricity distribution and land records are sectors that could benefit.
- Blockchain-powered smart contracts, where every piece of information is recorded can enhance ease of doing business.
- It will augment the credibility, accuracy and efficiency of a contract while reducing the risk of frauds, substantially.
- Blockchain could play a crucial part in health insurance claims management by reducing the risk of insurance claim frauds.
- The technology can also be used to prevent the sale of spurious drugs in the country by tracking every step of the supply chain network.
- Artificial Intelligence and Internet of Things (IoT) can gain immensely from blockchain applications.
- In an IoT world, thousands of devices would need to rapidly and seamlessly transact with each other in real time.
- The adoption of blockchain by India's banks could help avert frauds such as the one at Punjab National Bank as the technology updates information across all users simultaneously.
- It could be used to further strengthen our national institutions, including the judiciary and the Election Commission.
- Critical citizen information like land records, census data, birth and death records, business licenses, criminal records, intellectual property registry, electoral rolls could all be maintained as blockchain-powered, tamper-proof public ledgers.

Challenges:

- Blockchain technology is expensive to initially put it in place.

- The massive usage of energy for the functioning of blockchain.
- Safeguarding the privacy of individuals and companies as blockchains are usually open ledgers for everyone to see.
- Knowledge of the benefits of distributed ledger technology is still limited.
- If automated risk management, smart contracts, and similar tools are deployed across a network, cascades of rapid and hard-to-control obligations and liquidity flows could propagate across a network.
- This interdependence will likely call for creative organizational thinking to address the need for governance and strong risk management

Blockchain in Social sectors:

- **Personal Identification:** Governments manage vast amounts of personal data from birth and death records to marriage certificates, passports and census data. Blockchain technology offers a streamlined solution for managing all of it securely.
- **Fight corruption:** Registering government transactions in the blockchain helps create a trusted history for any transaction and significantly eases the auditing process. This would contribute to making public procurement more transparent
- **Cut redtapism:** As government agencies currently store data in autonomous centralized databases, they tend not to interoperate in an optimal way. This results in duplication, overlap and contradiction in the information held. Blockchain eliminates this lack of interoperability which generates unnecessary red tape in obtaining relevant information from a user, and makes the process for sharing data between agencies clear and inexpensive.
- **Identity and Land rights:** The World Identity Network and Humanized Internet project can store identifiers such as birth certificates and university degrees on a blockchain, in the form of distributed digital lockboxes. Users can keep their information private and secure, but also give permission for anyone to access it anywhere in the world. Several governments, including those in Dubai, Estonia, Georgia, and Sweden are making early forays into blockchain-based approaches to securing property rights.
- **Agriculture:** First of all, it can reduce contamination and food fraud. This can happen with the help of blockchain efficiency and transparency. Blockchain's role is to improve the third party involvement by ensuring that they are tracking, collecting and managing data in the best possible way. With blockchain, farmers and distributors are going to get their payments faster than ever-improving their ability to work on their next set of projects faster.
- **Health:** The health sector is one of those sectors that have tons of initiatives by both for-profit and non-profit organizations. With blockchain, healthcare can improve digital healthcare records. It also improves pharmaceutical supply chain management. As usual, blockchain offers a decentralized, efficient and secure solution.
- **Governance and democracy:** Government and civil society can also leverage blockchain technology to strengthen democratic processes and participation. Blockchain systems such as Ballotchain can manage online elections with secure and anonymous voting that participants can verify at any time.
- **Environmental protection:** In the environmental arena, new blockchain-supported supply chain management systems, which are transparent but cannot be tampered with, can track products from the farm to the table, and show whether or not a food product is organic or Fair Trade.
- **Philanthropy and Aid:** Billions of dollars are invested in helping the needy. However, these aids are mostly misused due to a lack of transparency. In fact, most of the aid never reaches the intended people. This has also led people to not contribute to these non-profit organizations.

Blockchain can solve all of these problems and help elevate the confidence in non-profit in utilizing the funds.

- **Crowdfunding:** As with traditional crowdfunding, a blockchain powered crowdfunding campaign seeks to secure investment for a new project from an interested community. But in this instance, funding is most likely to come in the form of bitcoin or other cryptocurrencies.

Way Forward:

- Blockchain, with all its possibilities, needs a serious look at its vulnerabilities and commerciality.
- Before introducing blockchain into the public sector data-handling system, we need a robust and informative data repository.
- Linking **IndiaChain** with Aadhar, thus creating a secure personal identity for all Indians.
- Proper regulations for the use of blockchain technology in the country.
- Identifying and resolving key issues and challenges in implementing this technology, the prime amongst those being data privacy.
- India should effectively channel its technical human capital surplus to position itself as one of the pioneers during this upcoming wave of innovation.

Regardless of the 'Make in India' initiative being a well-wished-for policy, it suffers from key limitations. Deliberate. (250 words)

The Hindu

Why this question:

The article examines critically the performance of "Make in India". Thus the question.

Key demand of the question:

Discuss in detail the objectives of the Make in India, explain the limitations and take hints from the article.

Directive:

Deliberate – Weigh up to what extent something is true. Persuade the reader of your argument by citing relevant research but also remember to point out any flaws and counter-arguments as well. Conclude by stating clearly how far you agree with the original proposition.

Structure of the answer:

Introduction:

Define the details of the scheme.

Body:

The 'Make in India' initiative is to encourage manufacturing in India and galvanize the economy with dedicated investments in manufacturing and services.

Explain the progress made so far.

Discuss the setbacks that the scheme has witnessed, explain the challenges.

Take hints from the article and explain the issues involved and suggest what reforms need to be brought out to address the challenges.

Conclusion:

Conclude that the lacunas need to be addressed to ensure viability of the scheme and attain success for the program for a long term period.

Introduction:

The Indian government announced the 'Make in India' initiative in 2014 to encourage manufacturing in India and galvanize the economy with dedicated investments in manufacturing and services. Immediately after the launch, investment commitments worth crores were announced. In 2015,

India emerged as the top destination for foreign direct investment, surpassing the U.S. and China. In line with the national programme, States too launched their own initiatives.

Body:

Make in India:

- The three major objectives were:
 - to increase the manufacturing sector's growth rate to 12-14% per annum in order to increase the sector's share in the economy;
 - to create 100 million additional manufacturing jobs in the economy by 2022; and
 - to ensure that the manufacturing sector's contribution to GDP is increased to 25% by 2022 (revised to 2025) from the current 16%.
- The policy approach was to create a conducive environment for investments, develop modern and efficient infrastructure, and open up new sectors for foreign capital.
- The focus of Make in India programme is on 25 sectors. These include: automobiles, aviation, chemicals, IT & BPM, pharmaceuticals, construction, defence manufacturing, electrical machinery, food processing, textiles and garments, ports, leather, media and entertainment, wellness, mining, tourism and hospitality, railways, automobile components, renewable energy, biotechnology, space, thermal power, roads and highways and electronics systems.

Appraisal of Make in India after 5 years:

- **Investment:**
 - The last five years witnessed slow growth of investment in the economy.
 - Gross fixed capital formation of the private sector, a measure of aggregate investment, declined to 28.6% of GDP in 2017-18 from 31.3% in 2013-14 (Economic Survey 2018-19).
 - Interestingly, though the public sector's share remained more or less the same during this period, the private sector's share declined from 24.2% to 21.5%.
 - Part of this problem can be attributed to the decline in the savings rate in the economy. Household savings have declined, while the private corporate sector's savings have increased.
 - Thus we find a scenario where the private sector's savings have increased, but investments have decreased, despite policy measures to provide a good investment climate.
- **Output Growth:**
 - The monthly index of industrial production pertaining to manufacturing has registered double-digit growth rates only on two occasions during the period April 2012 to November 2019.
 - In fact, data show that for a majority of the months, it was 3% or below and even negative for some months. Thus, negative growth implies contraction of the sector.
- **Employment Growth:**
 - Employment, especially industrial employment, has not grown to keep pace with the rate of new entries into the labour market

Reasons for slow growth in Make in India:

- **Ambitious targets:** It set out too ambitious growth rates for the manufacturing sector to achieve. An annual growth rate of 12-14% is well beyond the capacity of the industrial sector.
- **Multiple targets:** The initiative brought in too many sectors into its fold. This led to a loss of policy focus. Further, it was seen as a policy devoid of any understanding of the comparative advantages of the domestic economy.
- **Excessive dependence on foreign capital:** The policy relied too much on foreign capital for investment. Thus in the uncertainties of the global economy and ever-rising trade protectionism, the initiative was spectacularly ill-timed.
- **Low Productivity:** Productivity of Indian factories is low and workers have insufficient skills. McKinsey report states that Indian workers in the manufacturing sector are, on average, almost four and five times less productive than their counterparts in Thailand and China.
- **Complex Labour Laws:** One of the major reasons behind small companies is the complicated labour regulations for plants with more than 100 employees. Government approval is required under the Industrial Disputes Act of 1947 before laying off any employees and the Contract Labour Act of 1970 requires government and employee approval for simple changes in an employee's job description or duties.

Conclusion:

Make in India and reforms that followed have led to an improvement in 'Ease of Doing Business' ranking. However, investments are yet to arrive. The 'Make in India' programme may have the potential to transform India into a manufacturing hub but if we are to achieve that potential, the government would have to move beyond rhetoric to actual implementation of the announced policies.

Explain the key features of National Biotechnology Development Strategy 2015-2020 (NBDS) also discuss How can Biotechnology be used to address various issues in India? (250 words)

[PIB](#)

Why this question:

The question is straightforward and aims to evaluate the objectives of the National Biotechnology Development Strategy 2015-2020 (NBDS).

Key demand of the question:

Discuss the key features of the policy and its significance to the overall development of the Biotech sector in the country; also explain the applications it offers to the other sectors.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly highlight the fact that Indian Government seeks to create a US\$ 100 billion biotech industry by 2025. It has launched various programs with a view to harness available human and unlimited biodiversity resources.

Body:

Discuss the objectives of the strategy in detail first.

The Strategy aims to establish India as a world-class bio-manufacturing hub. It intends to launch a major mission, backed with significant investments, for the creation of new biotech products, creates a strong infrastructure for R&D and commercialization, and empowers India's human resources scientifically and technologically.

Explain the possible benefits it would bring to other sectors of the country.

Conclusion:

Conclude with way forward and prospects of the sector in coming future.

Introduction:

United Nation Convention on Biological Diversity, defines Biotechnology “any technological application that uses biological systems, living organisms or derivatives thereof, to make or modify products or processes for specific use”. And “Biological resources” includes genetic resources, organisms or parts thereof, populations, or any other biotic component of ecosystems with actual or potential use or value for humanity. India has become the world’s 12th biggest biotechnology economy having the second highest number of USFDA-approved plants. Biotechnology will help developing countries accomplish things that they could never do.

Body:

The National Biotechnology Development Strategy -2015-2020 aims to establish India as a world-class bio-manufacturing hub. It intends to launch a major mission, backed with significant investments, for the creation of new biotech products, create a strong infrastructure for R&D and commercialization, and empower India’s human resources scientifically and technologically.

The Key elements of the Strategy are:

- Building a Skilled Workforce and Leadership
- Revitalizing the knowledge environment at par with the growing bio-economy
- Enhance Research opportunities in basic, disciplinary and inter-disciplinary sciences
- Encourage use-inspired discovery research
- Focus on biotechnology tools for inclusive development
- Nurturing innovation, translational capacity and entrepreneurship
- Ensuring a transparent, efficient and globally best Regulatory system and communication strategy
- Biotechnology cooperation- Fostering global and national alliances
- Strengthen Institutional Capacity with redesigned governance models
- Create a matrix of measurement of processes as well as outcome

Biotechnology has the following relevance in India:

▪ **Applications of Biotechnology in Medicine**

- Biotechnology techniques are used in medicine for diagnosis and treating different diseases. It gives opportunities for the people to protect themselves from dangerous diseases.
- The field of Biotechnology, genetic engineering has introduced techniques **like gene therapy, recombinant DNA technology and polymerase chain reaction** which use genes and DNA molecules to diagnose diseases and insert new and healthy genes in the body which replace the damaged cells
- Genetic modification in mosquitoes can solve the problems of epidemic diseases such as dengue and malaria

- Artificial insemination is the artificial introduction of semen into the reproductive tract of a female animal. It is used extensively in breeding animals, such as sheep and cattle
 - Medical researchers believe that stem cell therapy has the potential to dramatically change the treatment of human disease. A number of adult stem cell therapies already exist, particularly bone marrow transplants that are used to treat leukaemia.
 - Stem cell transplantation was first used in the treatment of blood disorders and it was a breakthrough. Conventionally known as bone marrow transplantation, the stem cells responsible for production of the blood cells reside in the bone marrow
- **Applications of Biotechnology in Agriculture**
- Biotechnology has played major role in agriculture by altering genes, studying and cloning various crops in order to provide better quality products of foods ultimately improving our lives.
 - Hybrid Seeds, Artificial Seeds, Photosynthesis improver, Stress resistant crops and plants, Bio-fertilisers, Bio-pesticides are some of the potential applications.
 - Potential advantages that biotechnology can confer across a wide range of agricultural applications are in areas such as livestock management, storage of agricultural products and sustaining current crop yields, while reducing the use of fertilizers, herbicides and pesticides.
 - Biotechnology offers a very promising alternative to synthetic foods and an improvement on conventional plant-breeding technologies. Combined with other advanced agricultural technologies, it offers an exciting and environmentally responsible way to meet consumer demand for sustainable agriculture.
- **Animal husbandry:**
- The application of biotechnology in this area, in increasing production efficiency through manipulation and control of physiological systems and improving the health and well-being of animals, assumes great significance.
 - Embryo transplantation, used with cattle, goats, pigs, and sheep, aims to increase the number of offspring from a quality female.
 - Cloning embryos to artificially produce genetic duplicates of an animal has also become possible.
 - Direct manipulation and alteration of an animal's genetic material— genetic engineering—has the potential to produce even more drastic changes in animal breeding. It is believed that genetically altered pigs may one day be able to provide compatible organs for emergency transplantation (xenotransplantation) into humans.
- **Application of Biotechnology in Food Processing**
- Biotechnology has a major application in the food sector.
 - Bread, cheese, wine, beer, yogurt, and vinegar are all made by culturing microorganisms and are really the oldest products of biotechnology.

- It helps in improving the edibility, texture, and storage of the food; in preventing the attack of the food, mainly dairy, by the virus like bacteriophage.
 - Biotechnologists are also developing tests that will allow the detection of food-contaminating microorganisms and the toxins they produce, which may be present only in minute quantities.
 - Biotechnology also has applications in the detection of mutagens (substances that cause genetic mutations) in individual food products.
 - GM crops which have been approved for use in food items in select countries include corn, maize, soya, tomato, potato and papaya.
 - Latest innovations in biotechnology that fortify major staples with micro nutrients like vitamin A, zinc and iron can be game changers for hunger problem in India.
- **Environment:**
- Biotechnology can be used to tackle environmental issues like deforestation and air pollution
 - Biotechnology can help in finding out the level of Particulate Matter 2.5 in the air,
 - Biotechnology is already providing a clean and renewable alternative to traditional fossil fuels, the burning of which contributes to global warming.
 - The benefit of environmental biotechnology helps us to avoid the use of hazardous pollutants and wastes that affect the natural resources and the environment.
 - Biosensors, which combine a biological component (such as an enzyme) with various electronic components to trigger a circuit when a particular type of chemical is detected. Biosensors are capable of detecting extremely low levels of proteins, hormones, pollutants, gases, and other molecules.

Conclusion:

In a complex play of scientific progress and market forces, the biotechnology industry is recording growth that can rival the information technology industry boom of the 1990s. India with its young workforce and a potential market for the end-products can look out for a bright future in the biotechnology sector.

Briefly elucidate upon the steps taken by India for strengthening IPR focused on technology and innovation (250 words)

DIPP

Why this question:

Recently the Union Cabinet approved the proposal for Accession of India to the Nice, Vienna and Locarno Agreements, related to the World Intellectual Property Organization's (WIPO) international classification systems. Thus the context of the question.

Key demand of the question:

Discuss in detail the steps taken by India to strengthen the IPR that focuses on technology and innovation.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In short discuss what Intellectual Property is.

Body:

First briefly present the IPR scenario in India.

Then explain the efforts being made – In order to promote Intellectual Property in India Department of Industrial Policy and Promotion has taken various initiatives to ensure that intangible assets of the country are adequately protected such as: National IPR Policy 2016, Cell for IPR Promotion and Management (CIPAM), and other various awareness programmes, Filing of Patents and Trademarks applications has been made online. Almost all old Intellectual Property (IP) records have been digitized and new records are digitized immediately. Automated Electronic modules have been adopted to process Patents and Trademarks applications which enabled achieving enhanced speed, accuracy and Transparency etc.

Conclusion:

Conclude with way forward.

Introduction:

Intellectual Property Rights (IPRs) are legal rights, which result from intellectual invention, innovation and discovery in the industrial, scientific, literary and artistic fields. These rights entitle an individual or group to the moral and economic rights of creators in their creation. For ex: In India, **patents are granted for a period of 20 years** from the date of filing of the patent application. It is also to be noted that the patents are valid only within the territory where they have been granted. Once a patent expires, protection ends and the invention enters the public domain. In India, **Patent Acts, 1970** regulate the IPRs.

Body:

Important highlights from India's present National Intellectual Property Rights (IPR) Policy

- The Policy aims to push IPRs as a **marketable financial asset**, promote innovation and entrepreneurship, while protecting public interest.
- In order to have strong and effective IPR laws, steps would be taken — including review of existing IP laws — to update and improve them or to remove anomalies and inconsistencies.
- The policy is **entirely compliant with the WTO's agreement on TRIPS**.
- **Special thrust on awareness generation and effective enforcement of IPRs**, besides encouragement of IP commercialisation through various incentives.
- India will engage constructively in the negotiation of international treaties and agreements in consultation with stakeholders
- The government will examine accession to some multilateral treaties which are in India's interest, and become a signatory to those treaties which India has de facto implemented to enable it to participate in their decision making process, the policy said.
- It suggests making the department of industrial policy and promotion (DIPP) the nodal agency for all IPR issues. Copyrights related issues will also come under DIPP's ambit from that of the Human Resource Development (HRD) Ministry.
- Films, music, industrial drawings will be all covered by copyright.

- The Policy also seeks to **facilitate domestic IPR filings**, for the entire value chain from IPR generation to commercialization. It aims to promote research and development through tax benefits.

The steps taken by India for strengthening IPR:

- The statutes governing different kinds of IPRs in India are **Patents Act, 1970; Trade Marks Act, 1999; Designs Act, 2000; Geographical Indications of Goods (Registration and Protection) Act, 1999; Copyright Act, 1957; Protection of Plant Varieties and Farmers' Rights Act, 2001; Semiconductor Integrated Circuits Layout-Design Act, 2000 and Biological Diversity Act, 2002.**
- The **Department of Industrial Policy and Promotion (DIPP)** is entrusted with matters concerning the specialised UN agency on IPRs, the World Intellectual Property Organisation (WIPO), including coordination with other concerned Ministries or Departments.
- The **Controller General of Patents, Designs and Trade Marks (CGPDTM)** under the Department of Industrial Policy and Promotion, Ministry of Commerce and Industry is entrusted with the responsibility of administering the laws relating to Patents, Designs, Trade Marks and Geographical Indications within the territory of India.
- The **Protection of Plant Varieties and Farmers' Rights Act, 2001** is a sui generis legislation in India providing protection for plant varieties and rights of farmers and is under the aegis of the Ministry of Agriculture.
- The preservation of biological diversity in India is under the Ministry of Environment and Forests; the **Biological Diversity Act 2002** provides mechanism for regulating access and ensuring fair and equitable sharing of benefits arising out of the use of biological resources and associated traditional knowledge.
- India has always been conscious of its obligations in the international arena, and has acceded to a number of international conventions to further the cause of IPRs globally.
- India was the first country to ratify the **Marrakesh Treaty 2013 for Access to Published Works by visually impaired persons.**
- The accession to the **Madrid Protocol in 2013** is a step towards global alignment for proprietors of marks.
- The **Indian Patent Office** has been recognized as an **International Search Authority** and an **International Preliminary Examination Authority.**
- The **Intellectual Property Appellate Board** hears appeals arising from the decisions of Controllers of Patents as also Registrars of Trade Marks and GIs.

Way forward:

- Fostering an environment where innovation flourishes and a knowledge economy is built, is the key idea. Hence, the policy should have a balance.
- It should encourage patenting and at the same time ensure that patentability of a product/process does not deter further innovation and progress.
- Intellectual Property must not be about patents on paper but dearth of application in reality. T
- The organisations such as CSIR and others must be encouraged to work upon socially useful applications of their patents.
- Support for innovation has to be accompanied with instruments that guard local companies against the misuse of market power, coercive bargaining and aggressive acquisition strategies.
- India needs to spread awareness on IPR in public and for its traditional industries to enable fair monetisation of IP Rights.

- It needs to safeguard its patents, copyrights and traditional knowledge by ensuring easy IPR rules.

The development of the anti-satellite (A-SAT) missile capability clenches vast implications for India. Explain and also discuss the associated concerns with the Mission Shakti. (250 words)

Reference: [The Hindu](#)

Why this question:

India showcased its anti-satellite (A-SAT) missile capability of the weapon, Mission Shakti, during the parade. Thus the context of the question.

Key demand of the question:

Discuss in detail the significance of development of the anti-satellite (A-SAT) missile capability for India; discuss the details of Mission Shakti and the challenges involved.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

First discuss what an anti-satellite (A-SAT) missile is.

Body:

Discuss the details of the missile technology; it has been developed by the Defence Research and Development Organization (DRDO).

The A-SAT technology enables India to destroy an enemy satellite by directly colliding with it with pinpoint accuracy.

A-SAT weapons play a critical role in providing the necessary strategic deterrence.

Discuss the prospects it will have for India's defence capabilities.

Explain the challenges involved in Mission Shakti in detail.

Conclusion:

Conclude with importance of such missions to India's defence capabilities.

Introduction:

India recently showcased its Anti-Satellite (ASAT) missile capability to the world as the ASAT weapon, Mission Shakti, developed by the Defence Research and Development Organisation (DRDO) rolled out on the Rajpath during the 71st Republic Day parade. In addition, the IAF's newest inductions, Chinook heavy lift helicopters and Apache attack helicopters, also made their debut during the flypast.

Body:

Anti-satellite (A-SAT) missile:

- ASAT is essentially a missile that can destroy or jam an enemy country's satellite in space. Until now, only USA, Russia and China had operational ASAT systems.
- ASAT are space weapons designed to incapacitate or destroy satellites for strategic military purposes.
- Space weapons can attack space weapons in orbit (ASAT), attack targets on the earth from space or disable missiles travelling through space.

- ASAT missiles are of two types – Kinetic or Non-Kinetic.
- Kinetic A-SAT physically strikes an object and destroys it like ballistic missile.
- Non-Kinetic A-SAT use non-physical means to disable/destroy a space object like frequency jamming.
- The theoretical range of A-SAT weapons is limited to 20,000km.
- The capabilities of ASAT have been demonstrated by United States, Russia, China and India.
- Israel is said to be on the path of developing its ASAT technology.

The significance of development of the anti-satellite (A-SAT) missile capability for India:

- The A-SAT technology enables India to destroy an enemy satellite by directly colliding with it with pinpoint accuracy.
- A-SAT weapons play a critical role in providing the necessary strategic deterrence.
- Provide critical information like troop movements and incoming missiles.
- India became the fourth nation in the world to test an ASAT weapon after US, Russia and China.

Mission Shakti:

The mission of shooting down a live satellite by an anti-satellite missile (A-SAT) targeted in the low earth orbit (LEO) in 2019 by India is known as Mission Shakti.

- Mission Shakti is a joint programme of the Defence Research and Development Organisation (DRDO) and the Indian Space Research Organisation (ISRO).
- India had announced in 2010 to develop a hit-to-kill A-SAT system, was fully successful and achieved all parameters as per plans.
- The target destroyed by DRDO's Ballistic Missile Defence interceptor (A-SAT missile) was an out of service Indian micro satellite launched by Indian Space Research Organisation (ISRO) in 2014.
- The anti-satellite missile test was conducted in the lower atmosphere to make sure that there is no space debris. Whatever wreckage is generated will decompose and fall back in the earth within weeks.

Significance of Mission Shakti:

- Satellites are used by countries for navigation, communications and also for guiding their missile weaponry.
- The ability to bring down an enemy's missile, therefore, gives a country the capability to cripple critical infrastructure of the other country, rendering their weapons useless.
- Though the United States and the then Soviet Union both tested anti-satellite missiles way back in the 1970s at the height of the cold war, never has any country brought down the satellite of any other country, either during a conflict or by mistake.
- During the tests, countries target their own satellites, those which are no longer in use but continue to be in the space.
- A detailed statement by the Ministry of External Affairs (MEA) confirmed that an Indian satellite had been used for the test, but did not specify which satellite it was.
- PM Modi was careful to state that India's test was a "defensive" move, aimed at securing its space infrastructure, and does not change India's strong opposition to weaponisation of space.

Associated concerns with the Mission Shakti:

- Since nations use third-party satellites for their various needs, even striking down every satellite of a nation might not disable military communication of that nation entirely because that nation will simply use another nation's satellite to communicate.
- As all major nations have hundreds of dual-use satellites in orbit, it is near to impossible for any nation to stick down these satellites by such missiles.

- Also, if the situation comes when nations are striking down the satellites of adversary nations then the world has already reached the nuclear threshold.

Conclusion:

The successful development of ASAT technology has improved India's space power. It has demonstrated its capability to intercept any satellite. So, it has created a deterrence mechanism for its space satellites which are doing various military and civilian services.

Awareness in the fields of IT, Space, Computers, robotics, nano-technology, bio-technology and issues relating to intellectual property rights.

Discuss the technological and financial challenges that India has to overcome in the translation of the successes in the unmanned space missions into manned space missions.(250 words)

[The Hindu](#)

Why this question:

Four pilots from the Indian Air Force (IAF) will leave for Russia this month to receive training as astronauts of Gaganyaan, the first Indian crewed flight to space. Thus the context of the question.

Key demand of the question:

The question expects one to discuss the challenges that India space research organization is facing in conducting the manned and unmanned space missions.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Give a brief introduction about India's successes in unmanned space missions such as Mars orbiter mission, PSLV, GSLV etc.

Body:

Explain about India's ambitious programme Gaganyaan.

Write about the needed indigenization policies and technological inventions in this regard.

Suggest suitable measures to increase the financial capacity, international agreements etc.

Conclusion:

Give a futuristic way forward for the same.

Introduction:

The Prime Minister of India in his Independence Day address announced that an Indian astronaut would go into space by 2022, when India celebrates her 75th year of Independence. In pursuance of this, Indian Space Research Organization (ISRO) plans to fly the first unmanned test mission ahead of its ambitious crewed Gaganyaan mission by the end of 2020, according to ISRO Chairman.

Body:

Mission Gaganyaan:

- India's first manned space flight Gaganyaan is expected to send three persons into the space for seven days and the spacecraft will be placed in a low earth orbit of 300-400 km.
- Two unmanned Gaganyaan missions will be undertaken prior to sending humans.
- The total programme is expected to be completed before 2022 with first unmanned flight within 30 months.
- The mission is estimated at 9000 crore.
- It would raise scientific and technological temper across the country and inspire youngsters.
- When it achieves the mission, India would be the fourth nation to circle Earth after the Soviets, the Americans and the Chinese.

Technological challenges:

- For a manned mission, the key distinguishing capabilities that ISRO has had to develop include the ability
 - to bring the spacecraft back to Earth after flight
 - to build a spacecraft in which astronauts can live in Earth-like conditions in space
- India is yet to perfect fool-proof launch vehicle technology, the basic requirement for a manned space mission.
- The Polar Satellite launch vehicle and the Geosynchronous Launch vehicle, the two Indian spacecraft deployed to launch satellites and modules into space, are yet to be man-rated.
- India does not even have the facilities to train astronauts.
- ISRO has not been able to put in place India's own Global Positioning System in spite of completing the NavIC due to dysfunctional atomic clocks in the satellites, rendering the fleet a dud.
- The launchpad at the Sriharikota spaceport, the Satish Dhawan Space Centre, will have to be enhanced for the human mission.
- While the launch vehicle, crew module, re-entry technology, crew escape system is in place, monitoring and tracking systems, Environmental Control & Life Support System (ELCSS), space suit and crew support systems are still in the developmental phase.
- Although scores of landers sent by Russia, the U.S. and the Chinese have explored moon's surface, so far, no other agency has landed in the southern hemisphere of moon. ISRO hopes to be still the first to do so.

Financial challenges:

- Gaganyaan, announced by the Prime Minister in August 2018, is the ₹10,000-crore Indian human space flight scheduled for 2022.
- The Chandrayaan-3 lander and rover are estimated at ₹250 crore and will go to moon on a propulsion model. The GSLV Mark III vehicle costs around ₹350 crore.
- Chandrayaan-2 mission cost nearly ₹1000 crore, an orbiter carried the lander and the rover to a lunar orbit.

Way forward:

- It is important to ensure engagements at political level to obtain long term commitment for India's human space flight missions
- Financial implications of a long-term human space-flight programme development should be assessed and the returns and benefits should be clearly articulated
- It is important to overcome the technological challenges to ensure a safe, successful manned space mission. International collaboration in this domain can help India ensure a robust technology for its HSF programme.
- Selection of Indians for astronauts will be an important step. Procedures and specifications for astronauts and a rigorous selection process is suggested.
- These developments will help ISRO in perfecting the cryogenic technology for sending up heavier and heavier payloads and will reduce India's dependency on other countries to launch heavier satellites.

Conservation, environmental pollution and degradation, environmental impact assessment

Climate change is bound to increase the risk of forest fires further and the case for vice-versa also holds true, with suitable case studied critically analyse the statement.(250 words)

[The Guardian](#)

Why this question:

The question is from the context of the 2019-20 bushfire crises that coincided with Australia's hottest year on record.

Key demand of the question:

Discuss the impact of forest fires frequently being witnessed in the world and in what way climate change has been at the centre of causes leading to such fires. Also explain the interlinkages between the two.

Directive:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgment.

Structure of the answer:

Introduction:

Discuss the incidence of recent forest fires witnessed in Australia.

Body:

Forest fires have a significant impact on global atmospheric emissions, with biomass burning contributing to the global budgets of greenhouse gases, like carbon dioxide.

Discuss the concept of forest fires, causes and consequences; both positives and negatives.

Explain then the effect of climate change upon the forest fires.

And the vice-versa impact of it.

Conclusion:

Conclude with suggestions as to what should be done to overcome the threats posed by forest fires.

Introduction:

Australia is fighting one of its worst bushfire seasons, fuelled by record-breaking temperatures and months of severe drought. Australia has declared a state of emergency for the state of New South Wales (NSW) along with a catastrophic fire warning.

Body:

Current scenario of Bushfire in Australia:

- Wildfires have affected more than **12 million hectares of land in Australia** and the tragedy of the bushfires is still unfolding.
- The wildfires have caused **large scale loss to life and property** leading to the displacement of many residents.
- The wildfires have **destroyed the native flora and fauna, killing thousands of wild animals**. Australia is home to many endangered and rare species.
- New South Wales has been the most severely hit, with more than 1.65m hectares razed, an area significantly larger than suburban Sydney.

- Tourism which constitutes a major source of revenue for Australia has been affected by the raging bushfires.

Climate change and Forest fires are interlinked:

- The link between rising greenhouse gas emissions and increased bushfire risk is complex but, according to major science agencies, clear.
- Climate change does not create bushfires but it can and does make them worse.
- A number of factors contribute to bushfire risk, including temperature, fuel load, dryness, wind speed and humidity.
- This year a **natural weather phenomenon known as the Indian Ocean Dipole** has meant a hot, dry spell across the country.
- But the overwhelming scientific consensus is that rising levels of CO₂ are warming the planet. And Australia has been getting hotter over recent decades and is expected to continue doing so.
- Australia recorded its hottest month in January 2019, its third-hottest July and its hottest October day in some areas, among other temperature records. That comes on top of a long period of drought.
- Scientists have long warned that this hotter, drier climate will contribute to fires becoming more frequent and more intense.
- The more extreme weather patterns and higher temperatures increase the risk of bushfires and allow them to spread faster and wider.
- Complex computer models have not found a consistent climate change signal linked to rising CO₂ in the decline in rain that has produced the current eastern Australian drought.

Measures to fight forest fires:

- There are four approaches to fighting forest fires.
- The first is what may be called technological, where helicopters or ground-based personnel spray fire retardant chemicals, or pump water to fight the blaze.
- The second is to contain the fire in compartments bordered by natural barriers such as streams, roads, ridges, and fire lines along hillsides or across plains. A fire line is a line through a forest which has been cleared of all vegetation.
- The third is to set a counter fire, so that when a fire is unapproachable for humans, a line is cleared of combustibles and manned.
- The fourth approach, which is the most practical and most widely used, is to have enough people with leafy green boughs to beat the fire out. This is practised in combination with fire lines and counter fires.

Conclusion:

As evidenced, the Great Barrier Reef “is dying”, the “world-heritage rain forests are burning”, giant kelp forests have disappeared, “numerous towns have run out of water or are about to, and now the vast continent is burning on a scale never before seen.

Increasing the total area of forests is vital for India to meet its Intended nationally determined contributions under the ambit of Paris agreement 2015. Discuss. (250 words)

[Indian Express](#)

Why this question:

India, as part of its contribution to the global fight against climate change, has committed itself to creating an “additional carbon sink of 2.5 to 3 billion tonnes of carbon dioxide equivalent” by 2030. Thus the question.

Key demand of the question:

Discuss in detail the means and ways through which India aims to achieve its climate change targets.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly bring out the highlights of the [State of Forest Report \(SFR\) 2019](#) relevant to the question.

Body:

Explain that while showing an increase in the carbon stock trapped in Indian forests in the last two years, the report also shows why it is going to be an uphill task for India in meeting one of its international obligations on climate change.

Discuss briefly relationship between the forests and carbon.

Explain the challenges that India is facing in meeting the targets.

Discuss why it is important for India to meet its INDC targets.

Elaborate on the efforts India is making in this direction.

Conclusion:

Conclude with what should be the way forward.

Introduction:

Forests, by absorbing carbon dioxide from the atmosphere for the process of photosynthesis, act as a natural sink of carbon. India, as part of its contribution to the global fight against climate change, has committed itself to creating an “additional carbon sink of 2.5 to 3 billion tonnes of carbon dioxide equivalent” by 2030. The India State of Forest Report (ISFR) 2019 has found an increase of 5,188 sq. km in total forest and tree cover in the country. Tree and forest cover together made up 24.56% (8,07,276 sq. km) of India’s area.

Body:

Importance of increasing forest cover in India:

- Maintenance of environmental stability through preservation and, where necessary, restoration of the ecological balance that has been adversely disturbed by serious depletion of the forests of the country.
- Checking soil erosion and denudation in the catchments areas of rivers, lakes, reservoirs in the “interest of soil and water conservation, for mitigating floods and droughts and for the retardation of siltation of reservoirs.
- Checking the extension of sand-dunes in the desert areas of Rajasthan and along the coastal tracts.
- Increasing substantially the forest/tree cover in the country through massive afforestation and social forestry programmes, especially on all denuded, degraded and unproductive lands.
- Meeting the requirements of fuel-wood, fodder, minor forest produce and small timber of the rural and tribal populations.
- Increasing the productivity of forests to meet essential national needs.
- Encouraging efficient utilisation of forest produce and maximising substitution of wood.

- Creating a massive people's movement with the involvement of women, for achieving these objectives and to minimise pressure on existing forests.
- Conserving the natural heritage of the country by preserving the remaining natural forests with the vast variety of flora and fauna, which represent the remarkable biological diversity and genetic resources of the country.
- Forests, by absorbing carbon dioxide from the atmosphere for the process of photosynthesis, act as a natural sink of carbon.
- Together with oceans, forests absorb nearly half of global annual carbon dioxide emissions.
- In fact, the carbon currently stored in the forests exceeds all the carbon emitted in the atmosphere since the start of the industrial age.
- An increase in the forest area is thus one of the most effective ways of reducing the emissions that accumulate in the atmosphere every year.

However, there are challenges:

- An assessment by the Forest Survey of India (FSI) last year had projected that, by 2030, the carbon stock in forests as well as tree cover was likely to reach 31.87 billion tonnes of carbon dioxide equivalent in the business as usual scenario.
- An additional 2.5 to 3 billion tonnes of sink, as India has promised to do, would mean taking the size of the sink close to 35 billion tonnes of carbon dioxide equivalent.
- Considering the rate of growth of the carbon sink in the last few years, that is quite a stiff target India has set for itself.
- In the last two years, the carbon sink has grown by just about 0.6%%.
- Even compared to 2005, the size of carbon sink has increased by barely 7.5%.
- To meet its NDC target, even with most optimistic estimates of carbon stock trapped in trees outside of forest areas, the sink has to grow by at least 15% to 20% over the next ten-year period.

Way forward:

- There are two key decisions to be made in this regard — selection of the baseline year, and addition of the contribution of the agriculture sector to carbon sink.
- The baseline year can impact the business-as-usual projections for 2030. BAU projections are obtained using policies that existed in the baseline year.
- Now, there has been a far greater effort in recent years to increase the country's forest cover.
- So a 2015 baseline would lead to a higher BAU estimate for 2030 compared to a 2005 baseline when less efforts were being made to add or regenerate forests.
- The FSI projections made last year used a 2015 baseline. If 2005 baseline is used, India's targets can be achieved relatively easily.
- India's emissions intensity target uses a 2005 baseline, so there is an argument that the forest target should also have the same baseline.
- But there is a strong demand for a 2015 baseline as well, so that it results in some concrete progress in adding new forest cover.
- When India announced its NDC in 2015, it did not mention the baseline year. It has to decide on it before it reconfirms its NDC targets ahead of the next climate change meeting in Glasgow towards the end of the year.
- At that time, India would also have to specify whether it wants to count the carbon sink in the agriculture sector in its target.

- The NDC specifically mentions that and “additional” 2.5 to 3 billion tonnes of carbon sink would be created through “additional forest and tree cover by 2030”, but Environment Ministry officials insist that tree cover outside forest areas must include agriculture as well.

How far do you think privatizing multi-use forest areas is a viable option to ensure contributions to commitments made to mitigate climate change? Critically examine in the backdrop of recently proposed Green Credit Scheme .(250 words)

The Hindu

Why this question:

The Forest Advisory Committee, an apex body tasked with adjudicating requests by the industry to raze forest land for commercial ends, has approved a scheme that could allow “forests” to be traded as a commodity. If implemented, it allows the Forest Department to outsource one of its responsibilities of reforestation to non-government agencies. Thus the question.

Key demand of the question:

Discuss in detail the pros and cons of privatizing multi-use forest areas in the country. Also highlight the opportunities and obstacles pointed out by the Green Credit Scheme.

Directive:

Critically examine – When asked to ‘Examine’, we have to look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgment.

Structure of the answer:

Introduction:

First discuss basic statistics of the forest area available in the country and the quantum of area required by the Industries.

Body:

Discuss that the Green credit scheme allows “forests” to be traded as a commodity. It allows the Forest Department to outsource one of its responsibilities of reforestation to non-government agencies. Then move onto present the advantages and disadvantages of such a move.

Explain that such a scheme will encourage plantation by individuals outside the traditional forest area and will help in meeting international commitments such as sustainable development goals and nationally determined contributions.

Also explain that Forests are treated as a mere commodity without any social or ecological character and that could pose a major challenge in meeting the goals of the policy.

Conclusion:

Conclude that a balanced approach is the need of the hour.

Introduction

The Forest Advisory Committee, an apex body tasked with adjudicating requests by the industry to raze forest land for commercial ends, has approved a scheme that could allow “forests” to be traded as a commodity. If implemented, it allows the Forest Department to outsource one of its responsibilities of reforestation to non-government agencies.

The total forest cover of the country is 7,12,249 sq km which is **21.67% of the geographical area** of the country. The 2019 survey has found an increase of 5,188 sq km in total forest and tree cover in the country. The nation’s tree and forest cover has largely hovered from 21-25% and is short of the **National Forest Policy, 1988**, which envisages **33%** to be under such cover.

Body

- **Green Credit Scheme**

Forest Advisory Committee (FAC) has recently proposed to overhaul the compensatory afforestation process by introducing the Green Credit Scheme.

- It will allow agencies to identify appropriate non-forest land and begin growing plantations. These agencies could be private companies, village forest communities or NGOs.
- After three years the land would be eligible to be considered as compensatory forest land.
- An industry needing forest land could then approach the agency and pay it for parcels of such forested land.
- The participating agency will be free to trade its asset, that is plantation, in parcels, with project proponents who need forest land.

The **concept of privatizing** is thus introduced with this idea.

- **Privatizing of forest as a Viable Option**

Advantages

- The FAC believes that such a scheme will encourage plantation by individuals outside the traditional forest area.
- It will help in meeting international commitments such as sustainable development goals and nationally determined contributions.
- It will also help in solving various industries' complain that they find it hard to acquire appropriate non-forest land, which has to be contiguous to existing forest.
- The scheme will also supplement the **Green India Mission**, which is one of India's initiatives to combat climate change.
 - It aims to sequester 2.523 billion tonnes of carbon by 2020-30 and this involves adding 30 million hectares in addition to an existing forest.

However, it does not solve the core problems of afforestation or even compensatory afforestation.

Disadvantages

- It will allow the Forest Department to outsource one of its responsibilities of reforestation to non-government agencies. These agencies may not realize the ecological value of forest, nor have resources to manage them effectively.
- This could allow for "forests" to be traded as a commodity. It could lead to the privatization of multi-use forests into **monoculture plantations**, and even their destruction, along with loss of biodiversity and violation of land rights.
- If the economic value of these plantations becomes lucrative, it can pose a serious **threat to agricultural land**, by diverting the latter for plantations.
- If the company raising the plantation does not wish to trade, it can retain and harvest the plantation for timber, once ready. This goes against the rehabilitative

principle of compensatory afforestation which seeks to restore the ecological imbalance.

- The crisis of fragmentation of forests and the spike in **man-animal conflict** will augment.
- Plantations cannot replace biodiversity integral to natural forests.

Conclusion

The value of forests must be reimagined, pushing the policy discourse on nature beyond the narrow confines of profiteering. But if policy is to reflect this change in perspective, the apparatus of forest management must be made inclusive. The forest advisory committee, (the green credit scheme is its brainchild) must work in tandem with all stakeholders, including independent voices, so as not to miss the wood for the trees.

Gram Sabha-based forest governance is quintessential to sustain management and conservation of forests along with implementation of community forest resource rights under the Forest Right Act of the country. Elucidate.(250 words)

[Live Mint](#)

Why this question:

The article discusses in detail the role that Gram Sabhas have to play in managing and conserving forests in the country.

Key demand of the question:

Discuss in what way Gram Sabha-based forest governance is quintessential to sustain management and conservation of forests along with implementation of community forest resource rights under the Forest Right Act of the country.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly highlight the importance of conserving our forests.

Body:

Discuss Role of Gram Sabhas in general.

Explain why they should be given importance in the governance of the forest areas.

More than 300 million people including tribals live in and around forest areas in India, depending on forests for their sustenance and livelihood. Ecological security is the prime objective of National Forest Policy, 1988, but forest-dwelling communities cannot be separated from forests.

Explain that Provisions of the Panchayats (Extension to Scheduled Areas) Act, 1996 and Forest Right Act, 2006 have gone further to empower gram Sabhas for the management of forest resources.

Take queues from the article and explain in detail the relevance.

Conclusion:

Conclude with way forward and reassert that The gram Sabha-based forest governance has to be implemented in a large way to maintain sustainability of forests and improve their quality.

Introduction:

There are more than 300 million people including tribals live in and around forest areas in India, depending on forests for their sustenance and livelihood. Ecological security is the prime objective of National Forest Policy, 1988, but forest-dwelling communities cannot be separated from forests.

**Body:****Laws that empower gram sabhas for the management of forest resources:**

- The 73rd Constitutional amendment act provided importance to such institutions for resource management.
- Provisions of the Panchayats (Extension to Scheduled Areas) Act, 1996
- Forest Right Act, 2006

Importance of Gram Sabha-based forest governance:

- India's Constitution places trust in village-level institutions for conservation of forest resources.
- Gram Sabha ensures that the locals have a direct say in matters related to them thus devolving power at the grass root level
- The involvement of communities in forest management was initiated in 1990 through joint forest management institutions—a government-driven programme which did not achieve the objective of involvement of people in decision-making for sustainable forest management.
- Tribals have been residing in the forest for years, so the local community best know how the area around them can be developed but sustainably
- Over one million hectares of forests are managed by gram sabhas in eight states—Maharashtra, Chhattisgarh, Odisha, Madhya Pradesh, Kerala, Andhra Pradesh, Telangana and Rajasthan.
- Their knowledge about traditional use of forest produce as medicines can be harnessed for the benefit of all.
- Gram sabhas can potentially administer governance of more than 34 million hectare of forests.
- By demanding for their forest rights they in effect act as a check on reckless deforestation in name of development
- The Union ministry of tribal affairs has taken the initiative to conduct research for the development of models of forest governance based on gram sabhas.

Challenges faced by Gram Sabhas:

- There are no guidelines with respect to the management of community forest resources by gram sabhas.
- There are examples when some gram sabhas have shown both authority and responsibility, including when mining projects in Odisha were stopped by the gram sabha to save forests and livelihood.
- the present system of so many committees for the natural resource management at village level, including Joint Forest Management Committee, Biological Diversity Management Committee, Watershed Management Committee, and Forest Right Committee, is creating confusion.
- The opinions and recommendations given by the Gram Sabha regarding the sustainable use of forest resources are side-lined by the government
- The tribal communities routinely face existential threat by losing onto their land to development projects

Way forward:

- The supremacy of the gram sabha must be maintained while preparing governance models under the umbrella of national and state government policies, regulations and judicial orders.
- The bureaucracy must share authority with gram sabhas and the state forest department must perform the regulatory and monitoring role.

- There is need to have one committee which can have separate sub-committees for the management of forests and biodiversity.
- The gram sabha can maintain three bank accounts—operating account for implementing government schemes, core account for revenue received through sale of forest produce, and biodiversity account for receiving money for allowing access benefit sharing of bio-resources utilized by industry.
- The gram sabha-based forest governance has to be implemented in a large way to maintain sustainability of forests and improve their quality, along with implementation of community forest resource rights under the Forest Right Act, 2006.

Explain why the crisis engulfing nature matters for business and the economies of the world countries? Analyse in the backdrop of recently released nature risk rising report by World Economic Forum (WEF). (250 words)

India Times

Why this question:

The World Economic Forum (WEF) released a report titled Nature Risk Rising, the first in the series of New Nature Economy (NNE) reports. Thus the question.

Key demand of the question:

Discuss in detail the findings of the report; discuss why nature matters to the economies and business of the world. Highlight their importance.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Start with the fact that The World Economic Forum is launching a series of New Nature Economy (NNE) reports in 2020, making the business and economic case for safeguarding nature.

Body:

Discuss the details of the report and its key findings – The series of reports is being developed under the umbrella of the Nature Action Agenda (NAA), a platform for committed actors to catalyze public-private momentum in the run-up to the UN Convention on Biological Diversity COP15 – in Kunming, China, in October 2020.

The report explains how nature-related risks matter to business and why they must be urgently mainstreamed into risk management strategies.

Key findings:

Around \$44 trillion of economic value generation – more than half of the world’s total GDP – is moderately or highly dependent on nature and its services and is therefore exposed to nature loss. Together, the three largest sectors that are highly dependent on nature generate close to \$8 trillion of gross value added (GVA): construction (\$4 trillion); agriculture (\$2.5 trillion); and food and beverages (\$1.4 trillion), the report says.

Conclusion:

Conclude with significance of the report.

Introduction:

The World Economic Forum (WEF) in collaboration with PwC released a report titled “Nature Risk Rising: Why the Crisis Engulfing Nature Matters for Business and the Economy”. The report is the 1st in a series for the New Nature Economy(NNE). As per the report, global businesses are more than

dependent on nature with an estimated exposure of \$44 trillion which is half of world GDP (Gross Domestic Product).

Body:

Crisis engulfing nature matters for business and the economies of the world countries because:

- **Threat to plants & animals:**
 - 25% of the assessed plant & animal species are in threat due to human actions. Nearly a million species are to face extinction within decades. Human activities have severely altered 75% of land and 66% of marine environments too.
- **Nature dependent industries:**
 - Many countries are nature dependent industries. Among them, the 3 largest industries dependent on nature are Construction (\$ 4 trillion), agriculture (\$ 2.5 trillion) and food and beverages (\$ 1.4 trillion). Their combined value is twice the size of Germany's economy.
 - China, the EU (European Union) and the United States(US) have the highest absolute economic value in nature dependent industries generating \$2.7 trillion, \$2.4 trillion and \$2.1 trillion respectively.
- **Resources relied on by industries:**
 - 163 industry sectors have analysed that the GDP is highly dependent on nature and its services. Pollination, water quality and disease control are three examples of the services provided by an ecosystem.
 - Many industries rely on either the direct extraction of resources from forests & oceans or the provision of ecosystem services. Some of the examples include healthy soils, clean water, pollination and a stable climate.
 - Industries highly dependent on nature generate 15% of global GDP which is \$13 trillion, whereas moderately dependent industries generate 37% i.e., \$31 trillion.
 - Construction (USD 4 trillion), agriculture (USD 2.5 trillion) and food and beverages (USD 1.4 trillion) are the three largest industries that depend most on nature
- **Framework adoption:**
 - The WEF has already adopted a framework proposed by the Financial Stability Board's Task Force on Climate-related Financial Disclosures (TCFD) to identify, measure and manage climate risks which could be used to manage the nature risks.

Way forward:

- We have the power to change this.
- Humanity urgently needs to rethink its relationship with nature, in order to halt and reverse the alarming degradation of the natural world.
- Business leaders have a crucial role to play, by putting nature at the core of their processes and decision-making and systematically identifying, assessing, mitigating and disclosing nature-related risks to avoid severe consequences.
- Businesses can be part of the global movement to protect and restore nature.

Conclusion:

Nature loss matters for most businesses – through impacts on operations, supply chains, and markets. Despite an increasing focus on nature loss, there is still a limited understanding of why it matters to businesses and what the private sector can practically do about it. Thus, it is vital to

prioritize the protection of nature's assets and services within the broader global economic growth agenda.

Recently India achieved the complete phase out of one the most potent ozone depleting chemical – Hydrochlorofluorocarbon (HCFC)-141 b , discuss the impact of such a move.(250 words)

Reference: [Vikas Pedia](#)

Why this question:

India has successfully achieved the complete phase out of Hydrochlorofluorocarbon (HCFC)-141 b. Thus the question.

Key demand of the question:

Discuss in detail the positive impact of Phasing out of Ozone Depleting substances and also the challenges involved in doing so.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

India has successfully achieved the complete phase out of Hydrochlorofluorocarbon (HCFC)-141 b, which is a chemical used by foam manufacturing enterprises and one of the most potent ozone depleting chemical after Chlorofluorocarbons (CFCs) .(HCFC)-141 b is used mainly as a blowing agent in the production of rigid polyurethane (PU) foams.

Body:

Government of India through Ministry of Environment, Forest and Climate Change Brought out a notification through which the issuance of import license for HCFC-141b is prohibited from 1st January 2020 under Ozone Depleting Substances (Regulation and Control) Amendment Rules, 2019 issued under Environment (Protection) Act, 1986.

Nearly 50% of the consumption of ozone depleting chemical in the country was Attributable to HCFC-141b in the foam sector.

Discuss in detail the environmental benefits of the phase out; healing of the stratospheric ozone layer, aids climate change mitigation etc.

Explain the challenges involved in phasing out.

Conclusion:

Conclude with way forward.

Introduction:

The Ministry of Environment, Forest and Climate Change (MoEF&CC) notified that the issuance of import license for HCFC-141b is prohibited from 1st January 2020 under Ozone Depleting Substances (Regulation and Control) Amendment Rules, 2019. **Ozone Depleting Substances (Regulation and Control) Amendment Rules, 2019** have been issued under the **Environment (Protection) Act, 1986**. This step is among the first at this scale in **Article 5 (special status of developing countries)** parties under the **Montreal Protocol**.

Body:

HCFC- 141 b:

- It is a chemical used by foam manufacturers.
- It is used mainly as a blowing agent in the production of rigid polyurethane (PU) foams.

- It is one of the most potent ozone depleting chemical after Chlorofluorocarbons (CFCs).
- the foam manufacturing sector is a mix of large, medium and small enterprises having varying capacities, with the preponderance of Micro, Small, and Medium Enterprises (MSMEs).

Impacts of HCFCs on the environment:

- Hydrochlorofluorocarbons (HCFCs) are a large group of compounds, whose structure is very close to that of Chlorofluorocarbons (CFCs), but including one or more hydrogen atoms.
- As VOCs, they may be slightly involved in reactions to produce ozone, which can cause damage to plants and materials on a local scale.
- At a global level however, releases of HCFCs have serious environmental consequences. Although not as stable and therefore not so persistent in the atmosphere as CFCs, HBFCs or Halons, they can still end up in the higher atmosphere (stratosphere) where they can destroy the ozone layer, thus reducing the protection it offers the earth from the sun's harmful UV rays.
- HCFCs also contribute to Global Warming (through "the Greenhouse Effect"). Although the amounts emitted are relatively small, they have a powerful warming effect (a very high "Global Warming Potential").

Impact of phasing out of hydrochlorofluorocarbons (HCFC)-141 b:

- Nearly, 50% of the consumption of ozone depleting chemicals in the country was attributable to HCFC-141 b in the foam sector.
- India has now emerged as one among the few countries globally and a pioneer in some cases in the use of technologies, which are non-Ozone Depleting and have a low Global Warming Potential (GWP).
- The phase out of HCFC-141b from the country has twin environmental benefits, viz, **assisting the healing of the stratospheric ozone layer, and towards climate change mitigation due to transitioning of foam manufacturing enterprises** at this scale under HPMP to low global warming potential alternative technologies.

Conclusion:

India is one of the few countries that are pioneer in the use of non-Ozone Depleting technologies and have a low Global Warming Potential (GWP). The Ministry also adopted a structured approach to engage with foam manufacturing enterprises for providing technical and financial assistance in order to transition to non-ODS and low GWP technologies under the HCFC Phase-out Management Plan (HPMP).

The growing global stalemate over the climate crisis offers India the chance to focus upon the State and sub-State levels on developing its climate change action. Comment. (250 words)

Reference: [The Hindu](#)

Why this question:

The article discusses in detail the prevailing climate crisis the world countries are facing and as to what should be India's role in dealing with it by focusing upon State and Sub-State level planning and development.

Key demand of the question:

Discuss in detail the growing climate crisis in the world; explain what India should be doing to avoid the crisis in the coming future.

Directive:

Comment– here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

Explain with examples the ongoing climate crisis facing the world.

Body:

Discuss that the stalemate at the global level offers India the opportunity to focus earnestly on developing its climate change action at State and sub-State levels, where the environment and climate continue to be relegated to peripheral status.

Explain what will be the benefits of doing so – Attention to climate change offers co-benefits to India for development.

Elaborate upon the efforts being made by India.

Conclusion:

Conclude with what should be the way forward for India and efforts in this direction.

Introduction:

Global climate change has already had observable effects on the environment. Glaciers have shrunk, ice on rivers and lakes is breaking up earlier, plant and animal ranges have shifted and trees are flowering sooner.

Almost everyone agrees that the recent global climate summit, the annual Conference of the Parties (COP25), held in Madrid in December 2019, was a failure and that the multilateral process to address the climate crisis is broken. At several discussions on finance, ambition, transparency of support and pre-2020 action, wealthy countries were recalcitrant.

Body:

Ongoing climate crisis facing the world:

- Global warming above pre-industrial levels has touched about 1 degree Celsius.
- The IPCC 1.5 report basically says, at the current rates at which we are producing greenhouse gases, we are looking at a couple of decades really before what we have available is exhausted.
- At one level, for many people climate change has become an existential problem, a problem that risks undermining the conditions for productive life and therefore a problem that does not override but certainly permeates all kinds of other issues.
- For many others, climate change is a distant problem that is overwhelmed by more immediate issues.
- The rapid change of climate change is likely to exceed the ability of many species to migrate or adjust. Experts predict that one-fourth of Earth's species will be headed for extinction by 2050 if the warming trend continues at its current rate.
- Sea levels have risen between four and eight inches in the past 100 years. Current projections suggest that sea levels could continue to rise between 4 inches and 36 inches over the next 100 years.
- As temperatures rise globally, droughts will become more frequent and more severe, with potentially devastating consequences for agriculture, water supply and human health. This phenomenon has already been observed in some parts of Asia and Africa, where droughts have become longer and more intense.
- Hot temperatures and dry conditions also increase the likelihood of forest fires.

The stalemate at the global level offers India the opportunity to focus earnestly on developing its climate change:

- The stalemate at the global level offers India the opportunity to focus earnestly on developing its climate change action at State and sub-State levels, where the environment and climate continue to be relegated to peripheral status.
- Over decades, this has led to the destruction of ecosystems, forests, waterbodies and biodiversity.
- Numerous studies have shown the high economic and ecological costs and loss of lives due to extreme events.
- We do not need more data to stimulate action. As is also well recognised, India is extremely vulnerable to the effects of warming.
- With support from bilateral agencies, States initially took different approaches in the first round of State Action Plans on Climate Change (SAPCCs).
- Some of them set up separate climate change cells while some collaborated with academic institutions.
- A few produced detailed action plans while others developed strategy documents. Still others integrated improvements in energy efficiency (contributing to reducing emissions) while almost all focused on adaptation.
- Attention to climate change offers co-benefits to India for development. For instance:
- **Improving energy efficiency in industry reduces costs and local pollution;** improving public transport reduces congestion, pollution and improves access; and using natural farming methods reduces fossil fuel-based fertilizers, improves soil health and biodiversity.
- These show that there are synergies in the steps to be taken for good development and climate change. Emissions), while almost all focused on adaptation.
- As the next round of the SAPCCs are being drawn up, under recommendations from the Centre, the focus ought to be on integrating the response to climate change with the development plan in different departments.
- Since the States together are to deliver the Nationally Determined Contributions (NDCs) that India has promised, it means that they require guidance from the Centre.

Major initiatives of the Government towards combating climate change:

- **National Action Plan on Climate Change (NAPCC):** The Action plan covers eight major missions on Solar, Enhanced Energy Efficiency, Sustainable Habitat, and Water, Sustaining the Himalayan Ecosystem, Green India, Sustainable Agriculture and Strategic Knowledge on Climate Change.
- **International Solar Alliance (ISA):** ISA was jointly launched by the Prime Minister Narendra Modi, and the then President of France, Francois Hollande in Paris on the side-lines of CoP 21 in 2015. The vision and mission of the alliance is to provide a dedicated platform for cooperation among solar resource rich countries that lie completely or partial between the Tropics of Capricorn & Cancer.
- **State Action Plan on Climate Change (SAPCC):** State governments have drafted climate strategies aligned with the eight National Missions under the NAPCC. The strategies focus on issues ranging from climate mitigation, energy efficiency, and resource conservation to climate adaptation.
- **FAME Scheme for E-mobility:** Union Government in April 2015 launched Faster Adoption and Manufacturing of Hybrid and Electric vehicles (FAME) – India Scheme with an aim to boost sales of eco-friendly vehicles in the country. It is a part of the National Mission for Electric Mobility.
- **Atal Mission for Rejuvenation & Urban Transformation (AMRUT)** for Smart Cities.
- **Pradhan Mantri Ujjwala Yojana:** The scheme provides LPG connections to five crore below-poverty-line beneficiaries. The connections are given in the name of women beneficiaries to

reduce their dependence on fossil fuels and conventional fuel like cow dung for cooking food, thus reducing air pollution.

- **UJALA scheme:** The scheme was launched by the Prime Minister Narendra Modi in January 2015 with a target of replacing 77 crore incandescent lamps with LED bulbs. The usage of LED bulbs will not only result in reducing electricity bills but also help in environment protection.
- **Swachh Bharat Mission:** Swachh Bharat Abhiyan (Clean India Movement) is a campaign that was launched by Prime Minister Narendra Modi on October 2, 2014. The campaign seeks to clean the streets, roads and infrastructure of the country's 4041 statutory cities and towns.

On integration with states, districts and sub-district levels::

- Line departments for government schemes and programmes in key development sectors, such as agriculture, transport and water, should be identified for carefully integrating actions that respond to climate change.
- This integration should also take place at district and sub-district levels. But only a demonstration of its success in some departments would show how this can be done. But first and foremost, States need to get the signal that climate is an urgent issue.
- How funds for implementing SAPCCs will be obtained is not clear. There will not be enough from the Green Climate Fund, Adaptation Fund and bilateral agencies to support all States unless new sources are found.
- The coal cess in India is a good initiative, and as others have pointed out, could be used for environment and climate-related expenses. Similar alternative sources from high emissions' industries and practices would be an option, but still probably insufficient.
- There also needs to be a clear analysis of how the first round of action plans fared
- If States are to develop SAPCCs that would ultimately add up to India's NDCs, then the country needs reliable greenhouse gas inventories
- Individual research groups and the civil society initiative, GHG Platform India, have been producing such inventories and would be useful in synchronizing and coordinating State and Central mitigation programmes.

Conclusion:

States must also develop their programmes with longer timelines, with mid-course correction based on lessons and successes that can be integrated into the next stage of the plan. If the second round of SAPCCs were treated as an entry point to long-term development strategy, the States and the country would be better prepared for climate change. Ultimately, climate should be part and parcel of all thinking on development.

Discuss the importance and role played by Wetlands in the Ecological conservation of Earth. (250 words)

Reference: [The Hindu](#)

Why this question:

37 sites in the country have been freshly recognized under the international treaty of Ramsar Convention.

Key demand of the question:

Discuss in detail the importance and role played by Wetlands in the Ecological conservation of Earth.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

First discuss what wetlands are – Wetlands are defined as: “lands transitional between terrestrial and aquatic eco-systems where the water table is usually at or near the surface or the land is covered by shallow water”.

Body:

Discuss first the importance of wetlands to the ecosystem.

Wetlands are highly productive ecosystems that provide the world with nearly two-thirds of its fish harvest.

Wetlands play an integral role in the ecology of the watershed. The combination of shallow water, high levels of nutrients is ideal for the development of organisms that form the base of the food web and feed many species of fish, amphibians, shellfish and insects.

Wetlands’ microbes, plants and wildlife are part of global cycles for water, nitrogen and sulphur.

Wetlands store carbon within their plant communities and soil instead of releasing it to the atmosphere as carbon dioxide.

Wetlands function as natural barriers that trap and slowly release surface water, rain, snowmelt, groundwater and flood waters. Wetland vegetation also slow the speed of flood waters lowering flood heights and reduces soil erosion etc.

Discuss the importance of Ramsar convention. Explain the scenario in India.

Conclusion:

Conclude that along with such treaties, Spreading awareness by initiating awareness programs about the importance of wetlands and constant monitoring of wetlands for their water quality would provide vital inputs to safeguard the wetlands from further deterioration.

Introduction:

Wetlands are Ecotones between terrestrial and aquatic ecosystems. They get periodically get inundated with water. They support a flourishing community of aquatic organisms including frogs and other amphibians. Swamps, marshes and mangroves are examples of wetlands.

India has added 10 more wetlands to sites protected by the Ramsar Convention, With this, a total of 37 sites in the country have been recognized under the international treaty. Wetlands declared as Ramsar sites are protected under strict guidelines.

Body:

The importance of wetlands to the ecosystem:

- Wetlands play an integral role in the ecology of the watershed. The combination of shallow water, high levels of nutrients and primary productivity is ideal for the development of organisms that form the base of the food web and feed many species of fish, amphibians, shellfish and insects
- Wetlands are among the most productive ecosystems in the world, comparable to rain forests and coral reefs. An immense variety of species of microbes, plants, insects, amphibians, reptiles, birds, fish and mammals can be part of a wetland ecosystem.
- Wetlands are indispensable for the countless benefits or “ecosystem services” that they provide humanity, ranging from freshwater supply, food and building materials, and biodiversity, to flood control, groundwater recharge, and climate change mitigation.
- Wetlands are an important resource for sustainable tourism.
- They carry out water purification, filtration of sediments and nutrients from surface water.
- They help in nutrients recycling, groundwater recharging and stabilization of local climate.

- Buffer (act as a riparian buffer) shorelines against erosion and pollutants.
- They act as a genetic reservoir for various species of plants (especially rice).
- Wetlands function as natural sponges that trap and slowly release surface water, rain, snowmelt, groundwater and flood waters.

Role played by Wetlands in the Ecological conservation of Earth:

- **Flood attenuation:** many water-stressed regions in South Africa are subject to high intensity rainfall over very short periods, often resulting in flash floods. Wetlands are effective in spreading out and slowing down floodwaters, thereby reducing the severity of floods downstream.
- **Regulation of stream flow:** wetlands are often compared to sponges, in their ability to absorb water in wet periods, and release it during dry periods.
- **Sediment trapping:** wetlands reduce runoff velocity, and through their vegetation are effective in trapping and retaining sediment.
- **Phosphate and nitrate assimilation:** removal by the wetland of phosphates and nitrates carried by runoff water. This takes place through the presence of wetland vegetation and the action of anaerobic bacteria (which would otherwise not exist in fast-flowing, energised streams or rivers).
- **Erosion control:** wetlands can limit the extent of erosion, predominantly through the protection provided by vegetation, and through their ability to reduce stream flow velocity.
- **Maintenance of biodiversity:** through the provision of habitat and the maintenance of natural processes, wetlands contribute to supporting and maintaining biodiversity.

Ramsar convention

Ramsar convention is an international treaty for the conservation and wise use of wetlands. It is named after the Iranian city of Ramsar, on the Caspian Sea, where the treaty was signed on 2 February 1971. It is known officially as 'the Convention on Wetlands of International Importance especially as Waterfowl Habitat' (or, more recently, just 'the Convention on Wetlands'), it came into force in 1975.

Ramsar "Wise use concept" requires that wetlands' ecological character should be maintained within the framework of sustainable development. This concept recognizes that:

- Developmental activities are inevitable in wetland areas such as construction of roads, electricity infrastructure, schools and hospitals for poor families.
- Economic activities are also inevitable in wetland areas such as fisheries, farming and tourism.
- Such activities aid in human development and economic development in a wetland area.
- And for these activities, wetland's land, water and bio-resources will have to be used.
- However, these resources should not be used in a manner that wetland's ecological character is harmed.

Conclusion:

Wetland conservation is crucial for protecting biodiversity and mitigating the adverse impacts of climate change. At the same time, due to high level of poverty & population, it's not possible for developing countries & Least Developed Countries (LDCs) to keep wetlands in pristine conditions completely free from human activities

How to tackle the groundwater crisis in India especially keeping in view the demands of the farmer? Discuss. (250 words)

Reference: [Indian Express](#)

Why this question:

The article highlights the need to switch to newer approaches that are centric to farmers' demands and yet aid addressing the groundwater crisis.

Key demand of the question:

Discuss the rising issue of groundwater crisis in India and need to recognise the fact that farmers can be centric to approaches that can resolve the issue of groundwater crisis.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

First discuss key notable facts pointing at the crisis.

Body:

Discuss why there is a crisis in the groundwater in the country.

Establish the link existing between the groundwater crisis and agriculture; explain the role played by farmers.

Explain the factors responsible for the crisis and that agriculture is a major contributor and thus any approach that aims to address this issue must centre on agriculture with farmer as a key stakeholder.

Conclusion:

Conclude with solutions. Take hints from the articles and suggest way forward.

Introduction:

In 2020, according to the Niti Aayog, 21 Indian cities, including Delhi, Chennai and Bengaluru, will run out of groundwater. The Aayog's "**Composite Water Management Index**" (CWMI), released in June, notes that "Seventy per cent of our water resources are contaminated". Several other reports, including the Central Water Commission's "Water and Water Related Statistics 2019", have thrown light on the poor state of India's groundwater aquifers.

Body:

The groundwater crisis is embedded at two different levels:

- Groundwater exploitation of aquifers (where groundwater is stored) in different parts of the India and
- Groundwater contamination that find origins, both in geogenic source such as Arsenic and Fluoride along with anthropogenic sources of contamination primarily due to poor disposal of waste and wastewater.

Present Water Crisis

- Water levels in India's major reservoirs have fallen to 21 per cent of the average of the last decade.
- Fifty four per cent of the country's groundwater is declining faster than it is being replenished.
- There is a crippling dependence on monsoon rains to replenish most of India's key water sources– underground aquifers, lakes, rivers and reservoirs.
- Close to half the country, about 600 million people, face severe scarcity year after year.

- A June 2018 Niti Ayog report forecasts water demand will be twice the present supply and India could lose up to 6 per cent of its GDP.
- India's water table is falling in most parts; there is fluoride, arsenic, mercury, even uranium in our groundwater.
- The groundwater and sand extraction from most river beds and basins has turned unsustainable.
- Tanks and ponds are encroached upon.
- Dug-wells and borewells are constructed with alarming impunity to slide deeper and deeper to suck water from greater depths.
- Water is being diverted from food-crops to cash-crops; livelihoods to lifestyles; rural to urban—mismanagement is a bigger reason for the drought.
- Water shortages are hurting India's ability to produce power and 40% thermal power plants are in areas facing high water stress, a recent World Resources Institute report says
- Not only farmers, urban dwellers in cities and towns across India are also staring at a never seen before drinking water scarcity.
- Residents in the arid Thar desert of Rajasthan are spending Rs 2,500 to buy 2,500 litres of water which they share with their cattle.

Reasons for ground water exploitation in India:

- Groundwater is one of the most important water sources in India accounting for 63% of all irrigation water and over 80% of the rural and urban domestic water supplies.

Subsidies:

- Subsidies on electricity are thought to play a central role in the Indian groundwater crisis.
- The vast majority of groundwater pumps are unmetered, and if charged, are billed at a flat, non-volumetric, and highly subsidized tariff.

Water intensive crops:

- Government encourages farmers to produce water-intensive crops like rice and sugarcane through increased minimum support prices (MSP). This has also led to groundwater depletion, income inequality and unsustainable agriculture.
- Farmers are digging more and more borewells, but the sources of the problem are many, including transition to water-intensive crops and spate of construction activity along catchment areas.

Unpredictable monsoon:

- Successive droughts and erratic rainfall have led to excess extraction of groundwater. That explains 61 per cent decline in groundwater level in wells in India between 2007 and 2017.

Land use changes:

- India's huge groundwater-dependent population, uncertain climate-reliant recharge processes and indiscriminate land use changes with urbanization are among the many factors that have rendered the Indian groundwater scenario to become a global paradigm for water scarcity, for both quantity and quality.
- Trans-boundary upstream water sources and archaic irrigation methods for the water shortage.

Government failure:

- The government finance for well digging and pump installation with capital subsidies, massive rural electrification and pervasive energy subsidies all have enabled this process to aggravate.
- In the north western parts of India and southern peninsula, the early and rapid rural electrification, free or subsidised power to the farm sector, large productive farmers and attractive procurement prices for major cereals led to intensive use of groundwater.
- Zero marginal cost of pumping and lack of restriction on volume of water resulted in inefficient and unsustainable use of the resource.
- Lack of adequate planning, crumbling infrastructure, indiscriminate drilling of borewells, large-scale consumption of water, and a false sense of entitlement in using water carelessly are causing water shortages.

Steps needed to be taken in this regard:

- Jal Shakti Ministry has been incorporated to address the issue. It clubs Water Resources, River Development and Ganga Rejuvenation) and has promised that it would ensure potable, piped drinking water to every home by 2024.
- Serious crisis has been partly avoided as rabi crops have been harvested and kharif crops are yet to be sown.
- States are also taking the lead in this regard with various schemes like:
 - Mukhya Mantri Jal Swavlamban Abhiyan-Rajasthan
 - Jalyukt Shivar Abhiyan-Maharashtra
- Hiware Bazar, a village in the Ahmednagar District of Maharashtra, India is noted for its irrigation system and water conservation program, with which it has fought the drought and drinking water problems.
- Prime Minister has written to all Sarpanch in the country to undertake water conservation programme within their village.
- India has had a Groundwater Management and Regulation Scheme since 2013.
- The Atal Bhujal Yojana will draw on some of the institutions created by this scheme, especially village-level water user associations (WUAs).
- The Atal Bhujal Yojana would do well to follow the Niti Aayog's recommendations for strengthening the financial state of the WUAs, including allowing these bodies to retain a significant portion of irrigation fees.

Measures needed:

Reducing electricity subsidies:

- An analysis of panel data across 370 districts in India found that a reduction in electricity subsidy was correlated with a decrease in groundwater extraction.
- Most empirical studies are in favour of pricing electricity on the basis of actual consumption. They show that the energy prices at which the farmers start responding to tariff changes in terms of reducing the demand for water and electricity would be socio-economically viable.

Micro-irrigation:

- Encouraging farmers to adopt micro-irrigation techniques such as drip irrigation and micro-sprinklers.
- According to the CWMI report, adopting micro-irrigation techniques can save roughly 20% of the groundwater used annually on irrigation in India.

Creating awareness:

Telegram: <https://t.me/insightsIAStips>

Youtube: <https://www.youtube.com/channel/UCpoccbCX9GEIwaile4HLjwA>

Facebook: <https://www.facebook.com/insightsonindia>

- Creating sustainable change would require a bottom-up approach by empowering the local community to become active participants in managing groundwater.

Proper implementation of initiatives:

- 12th five-year plan proposed a policy of participatory groundwater management (PGM), which involves a collaborative approach among government departments, researchers, NGOs and community members.
- The plan involves training community workers to carry out aquifer mapping and implement innovative ways to use groundwater conservatively with the local community.
- Government has come up with a 6,000-crore World Bank-aided Atal Bhujal Yojana with community participation to ensure sustained groundwater management in overexploited and ground water-stressed areas in seven States.
- World Bank's Water Scarce Cities Initiative seeks to promote an integrated approach to managing water resources and service delivery in water-scarce cities as the basis for building resilience against climate change.
- India needs better policies that directly help small-holders and labourers to adapt and adjust to risks associated with groundwater depletion and a more variable future climate.
- Crisis can be tackled by restoring and enhancing groundwater recharge areas, stopping polluted water from recharging groundwater, rainwater and roof top harvesting and the restoration of ponds, lakes and other river systems.
- Growing less water-intensive crops in the dry season and transitioning away from irrigation-intensive systems where there is little water.
- Behavioural economics and other novel approaches can be brought to bear on maximizing agricultural production with minimal water use instead of focusing on marginal increases in yields with unbounded water use.
- Water-deficient states should promptly move towards micro-irrigation systems. These techniques have significantly higher efficiency vis-à-vis flood irrigation techniques.
- States should continue to focus on command area development (CAD). This is now part of Pradhan Mantri Krishi Sinchayee Yojana (PMKSY) which focuses on "more crop per drop".
- The cropping patterns in the states should be changed as per the agro-climatic zones. Improper cropping patterns affect both crop productivity and irrigation efficiency.
- Farmer producer organizations (FPO) provide a sense of ownership to farmers and encourage community-level involvement with lower transaction costs.
- India needs to establish data networks to track not only crop transpiration but also total inflows and recoverable outflows of irrigation water but also the losses to unrecoverable sinks such as evaporation.
- The CWMI report talks of other solutions like persuading farmers to adopt more efficient technologies such as drip irrigation.
- By emphasising on local-level institutions like the WUAs, the Atal Bhujal Yojana has signaled the Jal Shakti ministry's inclination towards such persuasive solutions.

Conclusion:

There is a need to modernise the regulatory framework for accessing groundwater soon after massive expansion in mechanical pumping led to the realisation that recharge could not keep pace with use.

Discuss the recently released enforcement and monitoring Guidelines for Sand Mining 2020. How far will the new guidelines help in Sustainable Sand Management?

Explain.(250 words)

Reference: [Indian Express](#)

Why this question:

Following a series of orders by the National Green Tribunal in 2018, the Ministry of Environment, Forests and Climate Change (MoEF) has for the first time released guidelines to monitor and check illegal sand mining in the country. Thus the question.

Key demand of the question:

Discuss in detail the new guidelines for sand mining and its significance; about illegal sand mining in India and government's efforts to curb it.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

First discuss the status of sand mining in the country, use data and quote facts.

Body:

Discuss briefly the background – The Mines and Minerals (Development and Regulation) Act, 1957 has empowered state governments to make rules to prevent illegal mining, transportation and storage of minerals.

But in the recent past, it has been observed that there were a large number of illegal mining cases in the country and in some cases, many of the officers lost their lives while executing their duties to curb illegal mining.

Illegal and uncontrolled illegal mining leads to loss of revenue to the State and degradation of the environment.

Discuss the aspects of Sustainable Sand Management.

Explain how these new rules would aid in Sustainable Sand Management of the country.

Conclusion:

Conclude with significance of such a move.

Introduction:

The Union Cabinet has approved the promulgation of Mineral Laws (Amendment) Ordinance 2020 that will amend the Mines and Minerals (Development and Regulation) Act 1957 and Coal Mines (Special Provisions) Act 2015.

Body:

Background:

- In 2018, the government had allowed commercial mining by private entities but non-coal companies couldn't participate in the auction.
- In August 2019, the government announced 100 per cent foreign direct investment (FDI) under the automatic route in coal mining for open sale, besides creating associated infrastructure, such as washeries.
- The Mines and Minerals (Development and Regulation) Act, 1957 has empowered state governments to make rules to prevent illegal mining, transportation and storage of minerals.

- But in the recent past, it has been observed that there were a large number of illegal mining cases in the country and in some cases, many of the officers lost their lives while executing their duties to curb illegal mining.
- Illegal and uncontrolled illegal mining leads to loss of revenue to the State and degradation of the environment.

Enforcement and monitoring Guidelines for Sand Mining 2020:

- The guidelines have basically laid down the uniform protocol to be followed by all states for monitoring and enforcement of rules. The gist of which is that enforcement of rules must continue even after the grant of green nod to the leaseholder through measures such as environment audit.
- **In case of river sand mining**, which is pertinent to Goa, the guidelines have stipulated that precautions must be taken that the water flows unhindered and the river meandering does not get affected.
- Furthermore, no river mining must be permitted in an area up to width of 100 meter from the active edge of the embankments or distance prescribed by the irrigation department.
- **To curb illegal sand mining, the recommendation is to use of technology through remote surveillance, drones, etc.**
- The states have been asked to monitor the movement of sand at different levels, for instance, at the time of sale and purchase at stockyards, and during transportation.
- The guidelines have said that sand transportation must be carried out with valid transport permits, and should be checked through an online monitoring system.
- **The guidelines have recommended special monitoring near state borders.**
- To identify illegal sand mining, the MOEF has suggested field visits, use of GPS instruments and satellite images to calculate the mined out area.
- The enforcement guidelines focus on *the “effective monitoring of sand mining from the identification of sand mineral sources to its dispatch and end-use by consumers and the general public and looks at a uniform protocol for the whole country”*
- **The 2020 guidelines are to be enforced simultaneously with the Sustainable Sand Management Guidelines, 2016**, but in instances where the two sets of guidelines may seem to be in conflict, the new set will hold legal precedence.
- In cases where rivers become district boundaries or state boundaries, the districts or states sharing the boundary shall constitute the combined task force for monitoring of mined materials, mining activity and participate in the preparation of **District Survey Reports (DSR) by providing appropriate inputs.**
- The guidelines say the detailed survey needs to be carried out for quantification of minerals and the demand and supply of the riverbed material through market survey, including the future demand for the next five years.
- It is suggested that the state government should develop an online portal for sale and purchase of sand and RBM. The state government will also decide the model of sale and the price of RBM.

These new rules would aid in Sustainable Sand Management of the country in following ways:-

- Identification and Quantification of Mineral Resource and its optimal utilization.
- To regulate the Sand & Gravel Mining in the Country since its identification to its final end-use by the consumers and the general public.
- Use of IT-enabled services & latest technologies for surveillance of the sand mining at each step.
- Reduction in demand & supply gaps.

- Setting up the procedure for replenishment study of Sand.
- Post Environmental Clearance Monitoring.
- Procedure for Environmental Audit.
- To control the instance of illegal mining.
- The guidelines also push for online sales and purchase of sand and other riverbed materials to make the process transparent

Procedure for Comprehensive DSRs:

- While the Sustainable Sand Mining Guidelines, 2016, require the preparation of District Survey Reports (DSR), which is an important initial step before grant of mining lease, the government has found that the DSRs carried out by state and district administrations are often not comprehensive enough, allowing space for illegal mining.
- The new guidelines, therefore, list a detailed procedure of how the DSRs are to be made, including the development of an inventory, for the first time, of river bed material and other sand sources in the district.

Critical appraisal of the Guidelines:

- The guidelines has put the entire onus on the states to enforce and monitor sustainable mining while completely relieving itself from any kind of responsibilities.
- There is no mechanism on who will enforce and monitor sustainable mining in bigger projects while states have been told to monitor for projects below 100 hectares.

Conclusion:

The new guidelines also focused on involving the public in the process. It said once mining sites that are to be auctioned for sand are identified, they should be put in public for at least one month for obtaining their comments and the final list should be finalized in accordance with them. Thus, the new guidelines are nothing but a compilation of all court orders for curbing illegal sand mining over the last few years.

Disaster and disaster management.

Discuss some of the key challenges faced in the India's Disaster Response Mechanism while suggesting solutions to the same. (250 words)

Reference: [VIF India](#)

Why this question:

The article discusses in detail the key challenges faced in the India's Disaster Response Mechanism.

Key demand of the question:

Discuss in detail the key challenges faced in the India's Disaster Response Mechanism and suggest solutions to overcome the same.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Start with what you understand by a Disaster and what is a Disaster Response Mechanism.

Body:

The question is straightforward and there isn't much to deliberate.

Disaster is an event or series of events, which gives rise to casualties and damage or loss of properties, infrastructures, environment, essential services or means of livelihood on such a scale which is beyond the normal capacity of the affected community to cope with.

Discuss some of the key Disasters faced by India – ranging from floods, droughts etc.

Discuss what are the key challenges in handling the Disasters in India.

Discuss the existing response mechanism available in the country.

Narrate the key challenges involved.

Conclusion:

Conclude with solutions to address them.

Introduction:

India is more vulnerable to natural disasters because of its unique geo-climatic condition, having recurrent floods, droughts, cyclones, earthquakes, and landslides. As India is a very large country, different regions are vulnerable to different natural disasters.

Disaster management in India refers to the conservation of lives and property during natural or man-made disasters. Disaster management plans are multi-layered and are planned to address issues such as floods, hurricanes, fires, mass failure of utilities, rapid spread of disease and droughts.

Body:

Key challenges in handling the Disasters in India:

Lack of governance:

- Most city governments struggle to deal with other day-to-day development challenges such as education, infrastructure and health, and so climate resilience and adaptation figure low on their priority list.
- Big cities such as Delhi and Mumbai have no city resilience plans because there is not just multiplicity of problems but also of authorities, which tend to work in silos whereas climate change cuts across several departments: public health, water, environment, energy, and social justice to name a few.

Lack of financial management:

- While the upfront capital costs of climate change mitigation and adaptation are being increasingly well understood, decision making and investment planning are hindered by uncertainty in the indirect costs and lack of simplified and transparent methods for assessing cost-benefit analysis of the steps that a city takes.
- They are not equipped with the financial management systems and processes required to access climate financing, such as green bonds

Lack of awareness:

1. Lack of active citizens who are informed and engaged on the subject of climate change and sustainability, which is essential to mitigate and build resilience, and demand accountability including transparency and information on liveability indicators such as air pollution levels, percentage of garbage segregated, modal share of public transport, walking and cycling.

Lack of manpower:

1. Then there is a shortage of skilled personnel specialized in areas such as environmental engineering transportation, traffic management, disaster management, and related areas.

No Environmental Impact Assessment:

- Roads, railway lines and housing colonies being laid and built without regard for natural water ways, but with formal planning permission.
- The State Disaster Management Agency also ignores them.
- Despite India being a signatory to the UN's Sendai Framework for Disaster Risk Reduction, little has changed on the ground.

Land use:

- Injudicious use of land is responsible for making states more prone to floods and landslides.
- However, other factors such as a change in land use patterns and climate change could have contributed to the situation on the ground.

Deforestation:

- Unfettered development activity had increased the chances of landslides, a major cause of casualties during the floods.
- Wetlands have been lost to development projects, construction of roads, and buildings at places too close to rivers.
- Other issues mentioned such as deforestation, encroachment and unplanned construction are self-evident priorities when development is viewed using the lens of climate-resilient water management (CRWM).

Disaster management constraints:

- There is a need to enhance the role of Civil Defence in Disaster Management process and formulating an effective National Plan for Disaster Management.
- Even now, the communication systems at the local level haven't been much developed.
- There are no Standard Operating Procedures for the deployment of National Disaster Response Force.
- There have been many cases where there has been a relief and rescue mobilization but by the time the teams reach the damage would have already been done.
- Ignoring all the safety guidelines, dwellings, factories and infrastructure facilities have been constructed in areas that are potentially vulnerable to natural hazards like floods.
- Disaster management plans exist on paper, but implementation remains a challenge.
- Despite the emphasis on a paradigm shift to a preparedness approach by the government, most parts of the country continue to follow a relief-centric approach in disaster management, rather than a proactive prevention, mitigation and preparedness path.

Disaster Response Mechanism:

- National Disaster Response Force remains afflicted with a number of constraints, be it in terms of infrastructure, training and equipment etc. to upgrade its efficiency up to the international standard.
- About 2% of the GDP of India is spent annually on post disaster recovery and added that the country cannot alleviate poverty and achieve our developmental goals unless concrete steps are taken to make the country disaster resilient.

- Lack of appropriate training infrastructure, well trained personnel and state of art technical equipment's.
- There is a need to bring about high end technology to increase our capacity in the domain of response and for that we need to integrate all our key institutions such as Indian Institute of Technology, Indian Institute of Management and Indian Space Research Organization in the area of research & development.
- Non-availability of critical equipment's, especially in the area of management of fire.

Way forward:

- Frame good macroeconomic policies before and after shocks.
- Provision in the budget for emergency spending helps crisis mitigation and resolution, insurance coverage and low public debt bolster government spending flexibility if reconstruction needs arise.
- Public investment in risk reduction.
- Improvement in government policy frameworks to better manage risk and mitigate economic and social costs.
- Estimate the probability of shocks and identify local vulnerabilities and integrate into plans for contingencies, investing in risk reduction, insurance, self-insurance, and disaster response.
- Tax and spending policies need to be flexible, to allow rapid redeployment of spending when needed.
- Coordination with foreign partners before disaster strikes could mobilize external assistance for risk reduction, which is likely to earn.
- NDRF needs to be better equipped with technical equipment and personnel training and emphasis should be laid on deploying young men in the response force.
- Need to have better coordination between NDMA and MHA for achieving an international standard response mechanism in India.
- Emergency medical response & preparedness for mass casualty management should acquire priority in the education curricula of medical nursing.
- The need and importance of priority attention to be accorded to training of personnel and procurement of modern equipment's.
- The government should create an online software for the management of the onsite data which could be updated without getting in to protocols.

Conclusion:

Disaster is a catastrophic situation in which normal pattern of life and or ecosystem has been disrupted and extraordinary emergency interventions are required to save and preserve lives and or environment. The best strategy is to be Proactive rather than reactive in tackling natural disasters and in mitigating the disasters in case of natural or man-made disasters.

Discuss the role of technology and advancement in Disaster management.(250 words)

Why this question:

Technology is being explored with great enthusiasm in solving various problems ranging from transportation to services delivery and industrial production. In this context it is important to analyze how Technology can help in disaster management.

Key demand of the question:

The question wants us to write in detail as to how Technology and innovation can play a role and help us in disaster management.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define what constitutes a Disaster.

Body:

Discuss the role of technology in disaster management E.g. technology has proven its merit as a resource for disaster relief and preparedness;

Technology in emergency responder agencies- identify and track populations such as elderly communities or areas with high concentrations of babies and children etc.

help rescue workers identify support resources and plan logistics during emergencies, also facilitates real-time communication during a disaster, and

emergency managers use the technology to forecast how residents will react to crises;

“By seeing how residents move, by gathering data on their experiences, what worked, what did not, and then going back after the emergency is over to study the emergency response and identify weak spots.” etc.

Discuss the utility of latest technologies such as Big data, artificial intelligence etc.

Conclusion:

Conclude with way forward.

Introduction:

A disaster is a sudden, calamitous event that seriously disrupts the functioning of a community or society and causes human, material, and economic or environmental losses that exceed the community's or society's ability to cope using its own resources. Though often caused by nature, disasters can have human origins.

Body:

India is a large country and prone to a number of natural hazards. Among all the natural disasters that country faces, river floods are the most frequent and often devastating. The shortfall in the rainfall causes droughts or drought like stimuli in various parts of the country. The country has faced some severe earthquakes causing widespread damage to the life and property. India has a coastline of about 8000 km which is prone to very severe cyclonic formations in the Arabian Sea and Bay of Bengal. Another major problem faced by the country is in the form of landslides and avalanches.

The role of Information Technology in disaster prevention:

GIS AND REMOTE SENSING:

- GIS provides a tool for effective and efficient storage and manipulation of remotely sensed data and other spatial and non-spatial data types for both scientific management and policy oriented
- This can be used to facilitate measurement, mapping, monitoring and modelling of variety of data types related to natural
- The specific GIS application in the field of Risk Assessment are Hazard Mapping to show earthquake, landslides, floods or fire hazards.
- Theses map could be created for cities, districts or even for the entire country and tropical cyclone T

Heat Maps are used by meteorological departments to improve the quality of the tropical storm warning services and quickly communicate the risk to the people likely to get affected by the

- : GIS and Remote Sensing can be used for preparing seismic hazards maps in order to assess the exact nature of risks.
- GIS can be used in carrying out search and rescue operations in a more effective manner by identifying areas that are disasters prone and zoning them accordingly to risk magnitudes

INTERNET:

- In the present era of electronic communication, the internet provides a useful platform for disaster mitigation communications.
- Launching of a well-defined web site is a very cost-effective means of making an intra-national and international presence felt.
- It provides a new and potentially revolutionary option for the rapid, automatic, and global dissemination of disaster information. A number of individuals and groups, including several national meteorological services, are experimenting with the Internet for real-time dissemination of weather observation, forecasts, satellite and other
- In the most critical phase of natural disasters electronic communication have provided the most effective and in some instances perhaps the only means of communication with the outside world.

WARNING AND FORECASTING SYSTEM:

- An advance system of forecasting, monitoring and issuing early warnings plays the most significant role in determining whether a natural hazard will assume disastrous proportions or
- Indian Meteorological Department (IMD) provides cyclone warnings from the Area Cyclone Warning Centres (ACWCs) It has developed the necessary infrastructure to originate and disseminate the cyclone warnings at appropriate
- Seismological observations in the country are made through national network of 36 seismic stations operated by the IMD, which is the nodal
- Long term drought proofing programmes on the natural resources of the district have been greatly helped by the use of satellite data obtained by National Remote Sensing Agency.
- The drought assessment is based on a comparative evaluation of satellite observed green vegetation cover (both area and greenness) of a district in any specific time period by the National Agricultural Drought Assessment and Management System (NADAMS).
- Flood forecasts and warnings are issued by the Central Water Commission (CWC) , Ministry of Water These are used for alerting the public and for taking appropriate measures by concerned administrative and state engineering agencies in the flood hazard

Conclusion:

Advancement in Information Technology in the form of Internet, GIS, Remote Sensing, Satellite communication, etc. Can help a great deal in planning and implementation of hazards reduction. For maximum benefit, new technologies for public communication should be made use and natural disaster mitigation messages should be conveyed through these measures.

Discuss in detail the Institutional Framework for Disaster Management in India. (250 words)

Reference: [VikasPedia](https://www.vikaspedia.com/)

Why this question:

The question is direct from the static portions of GS paper III.

Key demand of the question:

One must discuss in detail the Institutional Framework for Disaster Management in India.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain the Conceptual and Institutional Framework of Disaster Management in the country.

Body:

The National Disaster Management Authority (NDMA) was set up in 2005 by the Government of India as an apex body to spearhead and implement a holistic and integrated approach to Disaster Management.

NDMA has the responsibility for laying down policies, plans and guidelines for disaster management and coordinating their enforcement and implementation for ensuring preparedness, mitigation and timely and effective response to disasters.

NDMA has launched a number of initiatives to take the message of

Disaster management to all the stakeholders including community at the grassroots level.

NDMA has taken up mainstreaming of disaster risk reduction concerns in Government departments, States, Districts and civil society, School and College education, technical education, Panchayati Raj Institutions and

Urban Local Bodies. NDMA has laid down the framework of capacity building and mainstreaming DM for various disasters through its National Disaster Management Guidelines.

Conclusion:

Conclude with way forward.

Introduction:

The Indian subcontinent is among the world's most disaster prone areas. Almost 57% of the land is vulnerable to earthquake (high seismic zones III-V), 68% to drought, 8% to cyclones and 12% to floods.

Disaster management in India has evolved from an activity-based setup to an institutionalized structure; from single faculty domain to a multi-stakeholder setup; and from a relief-based approach to a 'multi-dimensional approach for reducing risk'

Body:

Institutional framework for disaster management in India:

The institutional structure for disaster management in India is hierarchical and functions at four levels – Centre, State, District and Local. The structure draws involvement of various relevant ministries, government departments and administrative bodies.

National Disaster Management Authority (NDMA):

- The Disaster Management ACT, 2005 provides for setting up of a National Disaster Management Authority (NDMA) with the Prime Minister as Chairperson.
- NDMA is to be assisted by a National Executive Committee which comprises of Secretaries to the Government of India heading various Ministries or Departments having administrative control over Agriculture, Atomic Energy, Defence, drinking water supply, environment and forests, finance, health, power, rural development, science and technology, space, telecommunication, urban development and water resources.

State Disaster Management Authority (SDMA):

- The Disaster Management Act 2005 also provides for setting up of State Disaster Management Authorities under the Chairpersonship of the Chief Minister.
- State Authority is to be assisted by a State Executive Committee under the Chairpersonship of the Chief Secretary of the State.

District Disaster Management Authority (DDMA):

- The structure of disaster management institutions goes down to the district level where the responsibility is given to DDMA which is headed by the Collector/ District Magistrate with elected representative of the local authority as co-chairperson.
- DDMA will act as the planning, coordinating and implementing body for disaster management at the district

Local Authority:

- For the purpose of disaster management, local authorities would include Panchayati Raj institutions and those agencies which control and manage civic services.
- These bodies are required to ensure capacity building of their employees for managing disasters and carrying out relief and reconstruction activities in the affected areas.

National Institute of Disaster Management (NIDM):

- The institute was formed as National Centre for Disaster Management (NCDM) in 1995 but was re-designated as National Institute of Disaster Management in 2005 after the enacting of the Disaster Management Act.
- The institute is headed by the Union Home Minister and Vice-Chairman, NDMA also acts as the Vice-President of the Institute.

National Disaster Response Force (NDRF):

- NDRF was constituted in 2006 with 8 battalions drawn from the paramilitary forces.
- Presently it has strength of 10 battalions. General superintendence of the force vests in NDMA and the force is headed by the Director General of NDRF and Civil Defence.
- These battalions are positioned at different locations to provide timely response to disaster situations and are available to State Governments at the time of need.

Integrated Data Resource Network (IDRN):

- Integrated Data Resource Network is a database in the electronic form maintained by the Ministry of Home Affairs.
- The data enlists inventory of equipment and human resources relevant to disaster management.

National Disaster Management Authority:

The Government of India (GOI), in recognition of the importance of Disaster Management as a national priority, has set up a High-Powered Committee (HPC) in August 1999 and also a nation committee after the Gujarat earthquake, for making recommendations on the preparation of Disaster Management plans and suggestion effective mitigation mechanisms.

NDMA Vision:

“To build a safer and disaster resilient India by a holistic, pro-active, technology driven and sustainable development strategy that involves all stakeholders and fosters a culture of prevention, preparedness and mitigation.”

Functions and Responsibilities:

NDMA, as the apex body, is mandated to lay down the policies, plans and guidelines for Disaster Management to ensure timely and effective response to disasters. Towards this, it has the following responsibilities: –

- Lay down policies on disaster management
- Approve the National Plan
- Approve plans prepared by the Ministries or Departments of the Government of India in accordance with the National Plan
- Lay down guidelines to be followed by the State Authorities in drawing up the State Plan
- Lay down guidelines to be followed by the different Ministries or Departments of the Government of India for the Purpose of integrating the measures for prevention of disaster or the mitigation of its effects in their development plans and projects
- Coordinate the enforcement and implementation of the policy and plans for disaster management
- Recommend provision of funds for the purpose of mitigation
- Provide such support to other countries affected by major disasters as may be determined by the Central Government
- Take such other measures for the prevention of disaster, or the mitigation, or preparedness and capacity building for dealing with threatening disaster situations or disasters as it may consider necessary
- Lay down broad policies and guidelines for the functioning of the National Institute of Disaster Management.

Conclusion:

International agencies also play a role in disaster management. UNDP along with NDMA took up Disaster Risk Reduction (DRR) and Urban Risk Reduction programmes. World Bank is associated with National Cyclone Risk Mitigation Project (NCRMP) being taken up in Andhra Pradesh and Orissa. Red Cross Society also provides valuable support during relief operations.

What do you understand by a public health emergency of international concern?
Present the case of Corona outbreak in China while discussing the preparedness of India for such an epidemic. (250 words)

Reference: [Live Mint](#)

Why this question:

Wuhan has been the epicenter of this spread of Coronavirus. There has been a consistent rise in number of cases registered and death due to it in the province. WHO has confirmed that the virus can spread from human-to-human. Thus the context of the question.

Key demand of the question:

Discuss in detail what a public health emergency of international concern is.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Public health emergency of international concern is defined as an “extraordinary event that is determined to constitute a public health risk to other States through the international spread of disease and to potentially require a coordinated international response.” The public emergency announcement is the highest level of alarm that is only raised during the gravest of outbreaks.

Body:

Discuss the case of corona virus spreading rapidly in China.

Explain the factors that need focus during such an outbreak.

Explain how China is managing the outbreak.

Discuss the levels of preparedness of India for such mass epidemics.

Conclusion:

Current health infrastructure in India paints a dismal picture of healthcare delivery system in the country, however India needs to ensure that the Central and state health agencies act in tandem and gear up the capacity to handle such concerns.

Introduction:

The World Health Organization (WHO) has announced that it was “too early” to declare the outbreak of the novel coronavirus in China a public health emergency of international concern (PHEIC), while warning that the number of cases may increase as much about the virus remains unknown.

Body:

Public health emergency of international concern

Public health emergency of international concern is defined as an “**extraordinary event that is determined to constitute a public health risk to other States through the international spread of disease and to potentially require a coordinated international response.**” The public emergency announcement is the highest level of alarm that is only raised during the gravest of outbreaks.

Coronavirus:

Coronaviruses (CoV) are a large family of viruses that cause illness ranging from the common cold to more severe diseases such as Middle East Respiratory Syndrome (MERS-CoV) and Severe Acute Respiratory Syndrome (SARS-CoV). Coronaviruses are zoonotic, meaning they are transmitted between animals and people.

Corona virus spreading rapidly in China

- China is struggling to contain the spread of a new virus that has claimed at least six lives so far since 31st December.
- Almost 300 people have been hospitalised. Worryingly enough doctors have confirmed that the infection is spreading rapidly among humans.
- The outbreak has triggered memories of SARS or severe acute respiratory syndrome, SARS originated in China in 2002, by 2003 it infected more than 8,000 people and killed 774 in a pandemic that ripped through Asia. The present virus is called the Coronavirus.
- It was first detected in Wuhan city that has cancelled the upcoming Lunar New Year celebrations, where hundreds of thousands of people were expected to attend.
- Tour agencies have also been banned from taking groups out of Wuhan, even as Chinese President Xi Jinping has ordered resolute efforts to curb the spread of the virus.
- With one patient infecting as many as 14 medical staff in just one hospital, Chinese doctors believe the disease is spreading far more easily than it was thought previously.
- By late January, there were 300 confirmed cases in China and a death count that was still in the single digits, but rising. And despite airport screenings, a traveler had brought the first case to the U.S.

The levels of preparedness of India for such mass epidemics:

- Most countries, including India, are unprepared for outbreaks of major infectious diseases, with Asian countries facing significant risks, according to the Global Health Security Index 2019.
- **India is not prepared to tackle health epidemics**, particularly given its urban congestion. In fact, given the city structure and the way the settlements have grown, epidemics, once they occur, will spread at a galloping rate.
- The slum clusters all around the cities, the unhygienic growth, and poor waste disposal system will only aggravate the situation.
- Health infrastructure is the basic support for the delivery of public health activities, but current facilities in the country paint a dismal picture of the delivery system.
- **There are 23,582 government hospitals with 710,761 beds in the country, according to the National Health Profile 2018. These comprise 19,810 hospitals in rural areas with 279,588 beds and 3,772 hospitals in urban areas with 431,173 beds.**
- More than 70% of India's population lives in rural areas and there are 156,231 sub centres, 25,650 primary health centres and 5,624 community health centres to cater to their needs, according to figures from 31 March 2017.

Conclusion:

The private sector has emerged as a strong force in India's healthcare service delivery. For health emergencies such as coronavirus, private hospitals have geared themselves up.

"Ease of living for women in the India is intricately linked to the water woes of the country", Comment. (250 words)

Reference: [Indian Express](#)

Why this question:

The question is in the backdrop of disasters in the form of water woes and in what way they affect the lives of women in the country directly. The article highlights the facts that With women playing a leadership role in managing their community's water resources, the Jal Jeevan Mission will provide a massive fillip to the ease of living for women, and they will no longer be beasts of burden.

**Key demand of the question:**

Discuss the interlinkages between Ease of living of women and the water scarcity/issues in the country.

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:**Introduction:**

Briefly discuss some facts pointing at the context of the question.

Body:

Discuss Role of women in handling water as a resource in the community.

Explain the water crisis prevalent in the country.

Explain why is it important to address water issues to ensure good living for women in the country.

One can use suitable case study and explain what needs to be done.

Quote the policies like Jal Jeevan mission and their reach.

Conclusion:

Conclude with way ahead.

Introduction:

For centuries, in most parts of the country, especially in rural areas, our women have borne the responsibility (or should I say the burden) of ensuring the water security of their homes. Our mothers and sisters have silently catered to every water need of their families. In some instances, this would involve walking long distances in unfriendly weather and treacherous terrain — in the blistering heat of Rajasthan to the majestic hills of Uttarakhand to the parched lands of eastern Maharashtra.

Body:**Water crisis prevalent in the country:**

- About 60% of the States were marked as “low performers” and this was cause for “alarm”.
- The report has predicted that by 2030, the country’s water demand is projected to be twice the available supply, implying severe water scarcity.
- Nearly 600 million Indians faced high to extreme water stress.
- About 2,00,000 people died every year due to inadequate access to safe water.
- 52% of India’s agricultural area remains dependent on rainfall so the future expansion of irrigation needs to be focused on last mile efficiency.
- Twenty-one cities, including Delhi, Bengaluru, Chennai and Hyderabad will run out of groundwater by 2020, affecting 100 million people.
- Critical groundwater resources, which accounted for 40% of India’s water supply, are being depleted at “unsustainable” rates and up to 70% of India’s water supply is “contaminated”.

Role of women in handling water as a resource in the community:

- According to a report by the National Commission for Women, on an average, a rural woman in Rajasthan walks over 2.5 km to reach a water source.

- This is probably an underestimate, but the bottom-line is that our women and girls spend a significant proportion of their time on fetching water.
- But things are changing. In 2014, India witnessed history in the making as the nation saw an incredible shift in the national development agenda.
- This shift in policy focus was to reduce the drudgery faced specially by women and girls, and improve their quality of life by providing them services targeted for their convenience.

Government measures to address the problem:

- The first major step in this direction was when Prime Minister Narendra Modi drew the attention of 1.25 billion Indians from the ramparts of the Red Fort and addressed the need to end the practice of open defecation — and restore the dignity of our women and their basic health.
- **By October 2019, all villages in India had declared themselves ODF.** Just recently, another study by scholars from the Ashoka University and the University of Virginia, has found that the increased *in-home toilet access in India has significantly reduced sexual assaults on women.*
- There were many subsequent programmes of our government focused on reducing drudgery for women, improving their health and giving them the respect they deserve. These programmes have also empowered women to lead the change.
- **The Ujjwala scheme provided LPG cylinders** to crores of rural women, saving them from the toxic fumes that they breathed on a daily basis when they burnt firewood for their chulhas.
- **The POSHAN abhiyan** supports the health of children, adolescent girls and women, to reduce cases of low birth weight, stunting, under-nutrition, and anaemia.
- **The Swachh Bharat Mission** has created a cadre of head women masons, better known as “Rani Mistris”, who have breached a traditional male bastion and have already constructed lakhs of toilets across the country.

Jal Jeevan mission – a solution:

The Mission was announced in August 2019. The chief objective of the Mission is to provide piped water supply (Har Ghar Jal) to all rural and urban households by 2024.

- With adequate capacity building and training, water can be most efficiently managed at the lowest appropriate level.
- Adopting this principle, the Jal Jeevan Mission’s first preference will be to have community-managed single village ground water-based schemes, wherever sufficient quantity and good quality of groundwater exists.
- Wherever adequate quantity of safe groundwater is not present, or where it may be technically not feasible to have single-village schemes, surface water-based multi-village schemes will be promoted.
- Further, in some remote regions, where it may not be techno-economically feasible to have household water supply schemes, local innovations, such as solar-based schemes will be encouraged.

- It is not commonly known that household waste water from HWS amounts to about 75% of the amount of water supplied.
- With the rural households to get HWS under the proposed mission, huge quantities of household waste water will be generated across the country, therefore making its effective management critical.
- There is a plan to include a mandatory provision under the mission for the effective channeling and treatment of household waste water, through appropriate and low cost drainage and treatment systems.
- Once appropriately treated, this waste water can be used for both recharge of groundwater as well as for irrigation purposes.

Way forward:

- An extensive information, education and communication will be needed to create a people's movement for water management.
- The ongoing Jal Shakti Abhiyan will help in creating awareness about the importance of integrating source sustainability and water reuse.
- This integrated approach to decentralized, community managed, and sustainable water management is the backbone of the government's plan to ensure that every household gets the benefits of water supply.

Conclusion:

With women playing a leadership role in managing their community's water resources, minus the drudgery of walking for miles to fetch water for their families, the Jal Jeevan Mission will provide a massive fillip to the ease of living for women, and they will no longer be beasts of burden. ***The signs are all there and the winds of change are in tandem with the mood of the nation. For real change, it is optimal that we ensure that the real heads of the households our mothers and sisters continue to be at the center of our country's development agenda.***

Discuss the significance of disaster prevention and highlight issues involved using a suitable case study.(250 words)

Reference: [Hindustan Times](#)

Why this question:

The question is in the backdrop of recent onset of Corona virus and the mass epidemic it has created in China, forcing us to evaluate the importance of disaster prevention methods.

Key demand of the question:

Discuss in detail the significance of disaster prevention in the cycle of disaster management.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:**Introduction:**

Briefly define what disaster prevention is.

Body:

Discuss the aspects of preparedness for Disaster; explain the key areas that need address for disaster prevention.

Define disaster, hazard, vulnerability and risk.

Describe the types and the causes of disasters.

Discuss the magnitude and distribution of disasters.

Explain different phases of disasters.

Take the case of China's Corona virus and suggest what needs to be done.

Conclusion:

Conclude with way forward.

Introduction:

Disaster prevention is the outright avoidance of adverse impacts of hazards and related disasters prevention (i.e. disaster prevention) expresses the concept and intention to completely avoid potential adverse impacts through action taken in advance.

Examples include dams or embankments that eliminate flood risks, land-use regulations that do not permit any settlement in high risk zones, and seismic engineering designs that ensure the survival and function of a critical building in any likely earthquake. Very often the complete avoidance of losses is not feasible and the task transforms to that of mitigation. Partly for this reason, the terms prevention and mitigation are sometimes used interchangeably in casual use.

Body:

Important key terminologies:

Disaster: several definitions are frequently given to disaster. The World Health Organization (WHO) defines a disaster as "a sudden ecological phenomenon of sufficient magnitude to require external assistance". It is also defined as any event, typically occurring suddenly, that causes damage, ecological disruption, loss of human life, deterioration of health and health services, and which exceeds the capacity of the affected community on a scale sufficient to require outside assistance

Hazard: is a rare or extreme event in the natural or human made environment that adversely affects human life, property or activity to the extent of causing a disaster. It is essential to make a distinction between hazards and disasters, and to recognize that the effect of the former upon the latter is essentially a measure of the society's vulnerability.

Vulnerability: is the degree of loss resulting from a potentially damaging phenomenon.

Risk: is the expected losses (lives lost, persons injured, damages to property and disruption of economic activity) due to a particular hazard. Risk is the product of hazard and vulnerability.

Risk is the probability that a person will experience an event in a specified period of time. Risk as a function of hazard and vulnerability, a relationship that is frequently illustrated with the following formula, although the association is not strictly arithmetic: **Risk = hazard x vulnerability**

The need for Disaster prevention:

- The Vulnerability Atlas of India reveals that about 60% area is vulnerable to Earthquakes, 8% to Cyclones, 12% to Floods and 68% of land under cultivation is prone to Drought.
- According to the United Nations International Strategy for Disaster Reduction (UNISDR), India ranked second after China for natural disasters.
- According to World Bank report, India's direct loss due to disaster is around 2% of its GDP.

- Rapid increase of population and urbanization along prone areas and other developments have increased the level of exposure to hazards.
- Floods are becoming a common phenomenon in India. Ignoring all the safety guidelines, dwellings, factories and infrastructure facilities have been constructed in areas that are potentially vulnerable to natural hazards like floods.
- As India is still not catching up with the developed countries in adopting disaster management strategies effectively, the losses are mounting.
- A report published in 2017 by the Comptroller and Auditor General (CAG) about India's performance audit on flood control and management schemes categorically stated that only 7% of dams (349 out of 4,862) have Emergency Action Plans.
- Man-made factors have compounded the scale of the disaster. Unabated expansion of hydro-power projects and construction of roads to accommodate ever-increasing tourism, especially religious tourism, are also major causes for the unprecedented scale of devastation.
- India has been ranked as the sixth most climate change-vulnerable country by the Climate Risk Index 2018.
- Dealing with current vulnerabilities and projected climate change impacts needs innovative thinking and participatory planning and action.

Challenges involved:

Lack of governance:

- Most city governments struggle to deal with other day-to-day development challenges such as education, infrastructure and health, and so climate resilience and adaptation figure low on their priority list.
- Big cities such as Delhi and Mumbai have no city resilience plans because there is not just multiplicity of problems but also of authorities, which tend to work in silos whereas climate change cuts across several departments: public health, water, environment, energy, and social justice to name a few.

Lack of financial management:

- While the upfront capital costs of climate change mitigation and adaptation are being increasingly well understood, decision making and investment planning are hindered by uncertainty in the indirect costs and lack of simplified and transparent methods for assessing cost-benefit analysis of the steps that a city takes.
- They are not equipped with the financial management systems and processes required to access climate financing, such as green bonds

Lack of awareness:

- Lack of active citizens who are informed and engaged on the subject of climate change and sustainability, which is essential to mitigate and build resilience, and demand accountability including transparency and information on liveability indicators such as air pollution levels, percentage of garbage segregated, modal share of public transport, walking and cycling.

**Lack of manpower:**

- Then there is a shortage of skilled personnel specialised in areas such as environmental engineering transportation, traffic management, disaster management, and related areas.

No Environmental Impact Assessment:

- Roads, railway lines and housing colonies being laid and built without regard for natural water ways, but with formal planning permission.
- The State Disaster Management Agency also ignores them.
- Despite India being a signatory to the UN's Sendai Framework for Disaster Risk Reduction, little has changed on the ground.

Land use:

- Injudicious use of land is responsible for making states more prone to floods and landslides.
- However, other factors such as a change in land use patterns and climate change could have contributed to the situation on the ground.

Deforestation:

- Unfettered development activity had increased the chances of landslides, a major cause of casualties during the floods.
- Wetlands have been lost to development projects, construction of roads, and buildings at places too close to rivers.
- Other issues mentioned such as deforestation, encroachment and unplanned construction are self-evident priorities when development is viewed using the lens of climate-resilient water management (CRWM).

Disaster management constraints:

- There is a need to enhance the role of Civil Defence in Disaster Management process and formulating an effective National Plan for Disaster Management.
- Even now, the communication systems at the local level haven't been much developed.
- There are no Standard Operating Procedures for the deployment of National Disaster Response Force.
- There have been many cases where there has been a relief and rescue mobilization but by the time the teams reach the damage would have already been done.
- Ignoring all the safety guidelines, dwellings, factories and infrastructure facilities have been constructed in areas that are potentially vulnerable to natural hazards like floods.
- Disaster management plans exist on paper, but implementation remains a challenge.
- Despite the emphasis on a paradigm shift to a preparedness approach by the government, most parts of the country continue to follow a relief-centric approach in disaster management, rather than a proactive prevention, mitigation and preparedness path.

- Disaster maps and vulnerability profiles by the Ministry of Housing and Urban Poverty Alleviation of the Government of India identify winds and cyclones, earthquakes, and floods as disaster risks.
- It is unclear if the maps have been updated to include weather and climate extremes and the associated crop losses or loss of lives or health risks.

Case of China's Corona virus

- In order to handle any issues regarding food, water and other essential supplies, the Hubei Foreign Affairs Office has also provided two helplines (027-87122256 and 87811173) on which the provincial authorities can be contacted round the clock
- In accordance with international practice and in accordance with relevant Chinese epidemic prevention regulations, China has made corresponding arrangements to provide necessary assistance,
- The evacuation of foreign nationals including Indians from Hubei and Wuhan remain mired in logistical issues especially about not allowing the virus to spread through those being evacuated.

Conclusion:

Infectious diseases including those of the zoonotic variety are on the rise in India. In addition, regions in India suffer from seasonal outbreaks of dengue, malaria and influenza strains. In this context, the nation-wide disease surveillance programme needs to be strengthened.

Linkages between development and spread of extremism.

Has the world entered a new normal where the space has become the next frontier?
Elucidate with suitable examples. (250 words)

Reference: [The Hindu](#)

Why this question:

The question is based on the theme that space security is next frontier that the world countries must aspire for.

Key demand of the question:

Discuss the possible threats that space as the new frontier poses upon the security aspects of a country. Explain with possible examples.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly explain that It's a brave new world for business leaders and emerging economies that want to flex their strength at zero gravity.

Body:

Explain that today we are in a complex, multifaceted geopolitical situation than the over-simplistic East-versus-West narrative of the past and that Space has occupied a new perspective.

Discuss the efforts being made by countries to explore space as the new frontier.

Explain the challenges that it may pose to internal security of a country.

Conclusion:

Conclude with what needs to be done to address the new threat.

Introduction:

Recently India carried out an anti-satellite (ASAT) test using an interceptor missile (as a kinetic kill vehicle) to neutralize a target satellite (possibly the Microsat-R launched in January this year) in a Low Earth Orbit (LEO) at an altitude of around 300 km.

In contrast, China had quietly carried out its first successful hit-to-kill intercept in January 2007 till international reports about the consequent increase in space debris forced Beijing to acknowledge the test. France and Israel are believed to possess the capability. India's test has not violated any norm as there is no international treaty prohibiting the testing or the development of ASATs.

Body:

Efforts being made by countries to explore space as the new frontier

- Both the U.S. and USSR began to develop ASAT systems as a part and parcel of their anti-ballistic missile programmes. During the 1980s, both countries concluded their kinetic kill interceptor testing.
- Instead, they began to focus on co-orbital anti-satellite systems and directed energy (laser) systems which could neutralise a satellite without fragmenting it and generating space debris.
- Since the Sputnik was launched in 1957, more than 8,000 satellites/manmade orbiting objects have been launched, of which about 5,000 remain in orbit; more than half are non-functional.
- Currently, more than 50 countries own/operate the nearly 2,000 functional satellites in orbit.
- The U.S. accounts for more than 800 of these, followed by China (approximately 280), Russia (approximately 150).
- India has an estimated 50 satellites. Of these 2,000 satellites, over 300 are dedicated military satellites.
- Once again, the U.S. has the biggest share here, with nearly 140, followed by Russia with nearly 90 and China with nearly 40.
- The salience of space in defence is evident from the fact that all three countries — the U.S., Russia and China — have set up 'Space Commands'.

India's efforts:

Over the last one year, the Indian Space Research Organisation (ISRO) took giant leaps forward, one success after the other.

- **INSAT:** The system is a network of satellites that facilitates communication and broadcasting across the south Asian region. It ushered in a revolution in India's television and radio broadcasting, telecommunications and meteorological sector.
- **Created Polarized Satellite Launch Vehicle (PSLV)** to make cost effective launch system. This has also increased international space collaboration by launching satellites of other nations at low costs.
- **Chandrayaan 1:** It has launched Chandrayaan 1 lunar probe mission in 2008.
- **Mangalyan:** ISRO has launched Mars Orbiter Mission in 2013 and created history by launching Mangalyan (mission spacecraft) into the Mars orbit in maiden attempt.
- **ASTROSAT:** It has launched first space observatory in 2015 to become fourth agency to do so after NASA, Roscosmos and ESA.
- **Scramjet:** Supersonic Combusting Ramjet has been launched by ISRO. This system works on Air-breathing Propulsion System which uses atmospheric oxygen to burn the fuel in the rocket.

- **RLV-TD:** ISRO demonstrated its Reusable Launch vehicle space shuttle RLV -TD to launch satellites around earth orbit and re-enter into the atmosphere.
- **104 satellites:** ISRO has created history by launching 104 satellites in one go.
- **Crew Escape module:** ISRO has test-launched Crew Escape Module paving the way for manned space mission Gaganyaan.

Privatization of Indian space:

- ISRO has been pursuing a conscious approach of building up and nurturing the industrial capabilities in the country to maximally support the Indian Space Programme.
- Through appropriate transfer of technology and hand-holding, ISRO is making focused efforts to consolidate and enhance participation of Indian industries for manufacturing and production of space related hardware such as rocket engine & stages, propellant tanks, spacecraft structures, solar panels, thermal control systems, electronic packages etc., required for satellites and launch vehicles.
- A number of private players have shown interest and promise in the Indian space programme, and a few of them are interested in their own launch vehicles. Privatizing the operation of the rocket would free up ISRO to focus on more cutting-edge missions.
- ISRO is severely constrained to meet the ever-increasing demands from over 60 central departments, 29 states and thousands of private sector companies hence urging the domestic industry to come forward and help augment the manufacture and launch of satellites will help ISRO.
- The nascent private space industry in India will not only provide services within the country but also opportunities for services in the neighboring countries and other parts of the globe.

Challenges:

- The salience of space in defence is evident from the fact that all three countries — the U.S., Russia and China — have set up '**Space Commands**'.
- This has given rise to demands to prevent the militarisation of space so that it is preserved "as the common heritage of mankind".
- The U.S. has been adamantly opposed to negotiating any legally binding instrument to prevent '**militarization of space**', questioning the very meaning of the term, given that space as a medium is increasingly used for military applications.
- Growing amounts of space debris pose a real risk to satellites and spacecraft. There are over 20,000 objects of debris which are the size of golf balls while those of smaller size run into hundreds of thousands, totalling nearly 6,000 tonnes.
- The U.S. Department of Defense routinely tracks approximately 23,000 man-made objects achieving orbit to ensure safety of its space-based assets.
- One of the reasons that the international community protested strongly about the 2007 Chinese test was that it added nearly 3,000 pieces of debris as the test was done at a higher altitude (800 km), from where it would take decades to dissipate.
- Anyhow, the debris created by the Indian test, which was undertaken at a low altitude, is expected to dissipate much faster.

Conclusion:

At present, the U.S. is the dominant presence in space, which reflects its technological lead as well its dependence on space-based assets. It therefore perceives any negotiations as a constraint on its technological lead. While countries have developed and tested ASATs, they are not known to have

stockpiled ASAT weapons. Effective use of an ASAT also requires space situational awareness capability, which works best if it is a cooperative effort.

Discuss the role of external state and non-state actors in creating challenges to internal security. (250 words)

Reference: [Idsa](#)

Why this question:

The question is straightforward and is from the static portions of the syllabus.

Key demand of the question:

Discuss in detail the role of external state and non-state actors in creating challenges to internal security.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

First explain who constitute external state and non-state actors.

Body:

Highlight that India has been facing internal security threats from various external and internal state and non-state actors since independence.

Explain about external non state actors – Non-state actors are individuals or organizations that have powerful economic, political or social power and are able to influence at a national and sometimes international level but do not belong to or allied themselves to any particular country or state. They include NGOs, MNCs, religious outfits, Drug Cartels, Mafias, terrorist groups etc. they may work in tandem for the peace, stability and development of a country or they may work against the State. Discuss the threat that they pose to internal security in India such as insurgency, terrorism, cyber security, communalism, counterfeit currency etc.

Discuss how should India deal with such challenges

Conclusion:

Conclude with solutions and ways to address the problems.

Introduction:

India has been facing challenges on the front of internal security since independence from various state and non-state actors. External State actors refer to those entities which have formal backing of a sovereign state for carrying out any intended action. Non state actors on the other hand, have a considerable power of influencing international events but they do not have formal state backing. Examples of state actors are the army, bureaucracy, intelligence agencies etc. whereas non state actors would be NGOs, civil society organizations, extremist outfits, multinational companies etc.

Body:

External State actors are responsible for posing a challenge to internal security in multiple ways:

- Countries surrounding India have been active in exploiting the volatile situation presented by the turmoil in the northeast. Not only countries such as China, Pakistan, Bangladesh and Myanmar, but also smaller powers such as Bhutan and Nepal have been involved in the region.
- Through political backing, economic assistance, logistic support, military training or arms supplies these countries have varyingly contributed to the ongoing violence in this region.

- The state may carry out a limited war against Indian state and this might have ramifications for our internal security too
- They might support the various insurgent groups, Naxalites, or separatist groups through funding, training or logistics
- There have been instances where state actors have been responsible for carrying out cyber warfare through hacking and other espionage.

Non state actors however have played their nefarious role too in creating problems for India:

- **Insurgency:**

- North-East suffers from violent movements based upon ethnic identities leading to clashes. China is alleged to support such acts for instance. ULFA members of Assam were given shelter by China.

- **Terrorism:**

- Pakistan has been a major exporter of terrorism to India. Non-state actors like terrorist groups for instance Lashkar-e-Taiba, Jaish-e-Mohammad are a continuous threat.
- Non state actor -sponsored terrorism, often motivated by fundamentalist ideologies, backed by secretive but efficient financial networks, use of IT, clandestine access to chemical-biological and nuclear materials, and illicit drug trafficking, has emerged as a major threat to international stability.
- These groups aim to not only create instability in states like J&K, they also have a larger aim of destabilising the country. This is done through sporadic terrorist strikes, which spreads terror and panic. This could also adversely affect the ability of the Indian state to pursue economic modernisation.

- **Naxalism:**

- Left wing extremism affects states like Chhattisgarh, Jharkhand and West Bengal.

- **Drug trafficking:**

- Inter and Intra state trafficking takes place, through golden crescent and golden triangle routes.
- Drugs from Golden Crescent (Pakistan, Afghanistan and Iran) have affected Punjab and Golden Triangle (Laos, Myanmar and Thailand) has affected North Eastern states.

- **Human-trafficking:**

- Children and women trafficking takes place via Bangladesh and Nepal.

- **Counterfeit currency:**

- It corrodes economy from inside, by facilitating black money and money laundering activities as well as funding terrorism, which itself creates a demand for fake currency, thereby creating a positive feedback loop. This is the issue arising especially from Pakistan.

- **Communalism:**

- Propagandas are run and funded by enemy country and other non-state actors (NGOs and CSOs) to destabilize India by damaging the socio-religious fabric and ensure riots.
- **Cyber Security:**
 - Recent cyber-attacks by Legion, ATM skimming are examples. Pakistani hackers often hack government websites.
 - They can also incite people for regionalism thus demanding their separate state which further increases secessionist tendency

Conclusion:

Both state and non-state factors from outside have created problems in our internal security framework. Hence while it is imperative to guard our borders and strengthen our diplomacy, on the other hand, we need to check the various non state actors who come in hidden forms. There is a need for a national internal security doctrine to deal with various challenges.

Security challenges and their management in border areas - linkages of organized crime with terrorism

India faces significant challenges in the internal, geopolitical and economic front going ahead in 2020. Managing these challenges will decide the progress India makes in 2020. Elucidate. (250 words)

Reference: [The Hindu](#)

Why this question:

The article brings out a detailed analysis of the Geopolitical fault-lines that have been widening since 2019 and in what way these challenges will contribute positively and negatively to the progress that India will make in 2020.

Key demand of the question:

Discuss the challenges that India is facing on the internal, external and economic fronts. Suggest solutions to resolve the same.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly explain the context of the question.

Body:

Firstly, discuss the problems India is facing on the internal, geopolitical and economic fronts.

Discuss the causative factors responsible for these challenges.

Explain in what way these factors will decide progress of India in 2020.

Conclusion:

Conclude with what needs to be done to address these threats and challenges.

Introduction:

In 2020, India needs to gear up to face thorny problems on the internal, geopolitical and economic fronts. The image of a darkening world which haunted 2019 continues, even as 2020 commences.

Together with increased turbulence, what is evident is that the world is regressing in several directions. Democracy and democratic freedoms are coming under increasing attack accompanied by a retreat from liberalism and globalisation. This is not limited to any one country or a group of countries, but is evident across much of the world.

Body:

Challenges that India is facing:

Geopolitical scenario:

- Geopolitical fault-lines widened in 2019. America's leadership of the world came under increasing threat from countries such as China.
- The future of the United Kingdom, under the shadow of Brexit, remained unclear. Europe seemed to be in eclipse. Latin and Central America were in turmoil.
- In Asia, Afghanistan appeared to be at a crossroads in its history. Instability plagued Syria, Iraq, Lebanon and Egypt.
- Civil war conditions prevailed in many regions. Violent protests raged in many domains, including Hong Kong, once a symbol of "One Country Two Systems".
- Existing threats to the security of nations remained unchanged, even as offensive cyber-attacks became the new weapon of choice in many situations.
- As 2020 progresses, the spectre that haunts nations is, if anything, bleaker. Geopolitically, it would be tempting to assert that this is perhaps the most troubled time in recent history, given the looming spectre of an all-out war between Iran and the United States.
- Exertion of "maximum pressure" by the U.S. to minimise Iran's influence and reduce its support to proxies in the region and elsewhere, combined with Iran's only slightly less provocative posture as seen towards the end of 2019, had resulted in a major stand-off by the beginning of 2020.

Domestic tensions:

- From a national perspective, 2019 posited at best, a mixed bag. Political tensions had intensified in the first half of the year in view of the General Elections held in April-May, and against the backdrop of victories of Opposition parties in the Assembly Elections in Madhya Pradesh, Rajasthan and Chhattisgarh towards the end of 2018.
- Acrimony over allegations of corruption, especially over the Rafale fighter aircraft deal, had further vitiated the political atmosphere.
- The Government initiated another controversial move to push through the Citizenship (Amendment) Act, which is implicitly seen as linked to a National Register of Citizens, though the Government (after having indicated at one point about such linkage) has since declared that this is not the case.
- It provoked widespread protests on the ground that the legislation violated some of the basic precepts of the Constitution, and applied the test of religion, to exclude (Muslim) refugees from neighbouring countries such as Pakistan, Bangladesh and Afghanistan, from being given Indian citizenship.

Neighbourhood ties:

- As 2020 commences, India's foreign policy challenges remain very considerable. India-Pakistan relations remain frozen, even as Pakistan continues to make overtures to the U.S., and further cements its relationship with China at one level and Saudi Arabia at another.

- Sino-Indian relations continue to be riddled with numerous problems. The vexed Sino-Indian border dispute remains in deep freeze.
- China, meanwhile, has embarked more aggressively on establishing its leadership across Asia; in the shadow play for influence across parts of Asia, including South Asia, China seems to be gaining at India's expense.
- India's attempts at creating a supportive environment in its immediate neighbourhood in 2020 remains equally challenging. While relations with the Maldives improved during the past year, the advent of a new Government in Sri Lanka, headed by the Rajapaksas, does not augur too well for India.
- Relations with the United Arab Emirates are better than at any time previously, but the India-Saudi Arabia relationship can at best be termed uncertain.
- Relations with Iran are likely to become highly problematic, in view of India's "tilt" towards the U.S., and the open hostility on display currently between Iran and the U.S.

Issues within the country:

- On the domestic front, India again will need to find solutions to quite a few thorny problems.
- Removing tight controls in J&K and restoring civil liberties there, including the release of senior political leaders, will require very deft handling, given the "pressure cooker" atmosphere that prevails.
- India will also need to watch out for a very different type of agitation in J&K, something between "civil disobedience" and an "intifada type" struggle.
- While India appears reasonably well-positioned to deal with some of the other internal threats, including insurgencies in the North-east, Naxalite violence, and the "terror imperative", the fallout of protests over the CAA has the potential to become India's most serious threat in decades.
- Already, the eddies of controversy over this and other disparate issues are beginning to coalesce into a major maelstrom of protests, with India's youth, including many belonging to universities and higher institutes of learning, up in arms on manifold issues.
- At present these seem to have little in common, excepting opposition to those in authority for the latter's perceived insensitivity to public protests.

Economic crisis:

- Furthermore, given the current economic malaise facing the country, which can hardly be treated as a cyclical phenomenon, the economic portents for 2020 also do not look too good.
- For several months now, the country has witnessed the slowing down of the economy and India's growth story appears set to lose much of its shine.
- A sustained below 5% GDP growth could become a recipe for disaster. Already, India is being mentioned as among 2020's top geopolitical risks.

Way forward:

India as an "emerging power" faces many challenges of poverty, internal conflicts, political instability in the domestic and regional ambit, as well as economic and security issues in the global realm. Hence, India's preoccupation ought to be directed at reforming the market structure, developing infrastructure to hasten growth of the manufacturing sector at the domestic level, rather than increasing India's dependence on an export-led economic system.

Such economic agendas call for significant changes in the domestic sphere: allocation of more funds to the social sector, job creation for the unemployed youth, health and sanitary issues, and an inclusive development agenda. This will ensure that a distinct identity can be furthered, instead of India merely emulating norms and practices constructed and sustained by countries with different social structures and domestic concerns.

Only an inclusive and all-round developmental agenda can allow India's inclusion in the "great power" club in a true sense, where development of its people will coincide with the development of the nation.

Conclusion:

Given the total impact of the various aspects, those in charge would do well to be aware of and prepare for the major problems that lie ahead. The digital revolution that is under way and the awesome power of Artificial Intelligence, Machine-Learning, Quantum Computing and Bio-Technology may not be enough in the circumstances.

Given a rising graph of cross-border terrorism over the past two decades, Discuss in what way cooperation with neighbors on security is essential for India. (250 words)

Reference: [Research Gate](#)

Why this question:

The question tends to analyse the effect of rising incidences of cross-border terrorism over the past two decades and in what way they necessitate India to have cooperation with neighbors on security.

Key demand of the question:

Discuss in detail the case of the question, highlight significance of the relations with neighbor countries and especially on the aspects of Security.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

With eleven neighboring countries (including four across the seas), many of which share cross-border Diasporas with India, internal peace and external security are inextricably intertwined.

Body:

Discuss in detail relations of India with the neighboring countries on a case by case basis; Bangladesh, China, Nepal and Pakistan etc.

Take hints from the article and explain singularly the key issues and threats posed by each neighboring country to India.

Explain what needs to be done and what should be the way ahead for India.

Conclusion:

India must seek to maintain independence of its foreign policy and security choices reflective of its civilizational ethos, while working in partnership with all friendly countries on issues of common interest.

Introduction:

India has one of the longest and most varied of international borders. Historical and political reasons have left India with an artificial unnatural border. Border Management is an integral approach towards borders in which along with security enhancement, infrastructure & human development is undertaken. The challenge of coping with long-standing territorial and boundary disputes with China

and Pakistan, combined with porous borders along some of the most difficult terrain in the world, has made effective and efficient border management a national priority.

Body:

Issues and threats posed by each neighboring country to India:

Indo-Pakistan Border:

- Indo-Pakistan Border (3,323 Km) runs along the states of Gujarat, Rajasthan, Punjab and J&K. Direct accessibility of the borders and some technological developments enabling quick passage of information and transfer of funds has changed the focus and tenor of border security.
- Cross-Border Terrorism from Pakistan has exacerbated due to non-recognition of boundaries by its terrorist groups and their success in acquiring legitimacy due to religious or ethnic identity.
- Inadequate Cooperation from Pakistan has made the management of border further difficult for India.

Indo-Bangladesh Border:

- The Indo-Bangladesh Border (4,096 Km) passes through West Bengal, Assam, Meghalaya, Tripura and Mizoram.
- The entire stretch consists of plains, riverine belts, hills & jungles which make illegal migration very easy.
- Illegal Migration across this border poses serious security threats and acts as a fertile ground for organisations like the Inter-Services Intelligence of Pakistan to penetrate and expand their activities.
- Also, poor law and order situation at the border, has led to smuggling of arms and drugs. Supply of arms help in sustaining any conflict.

Indo-China Border:

- India shares a long land border with China (3,488 Km) in the Indian states of Jammu & Kashmir, Himachal Pradesh, Uttarakhand, Sikkim and Arunachal Pradesh.
- Although this border remains relatively aloof from illegal migrations, this border remains a cause of constant vigil for Indian forces.
- India has a longstanding border dispute with China running back to British era in Aksai Chin and Arunachal Pradesh.

Indo-Nepal Border:

- India-Nepal Border (1,751 Km) is an open border in the sense that people of both the countries can cross it from any point, despite the existence of border check posts at several locations.
- Anti-India organizations use this border to plant their people in the territory of India.
- Also, smuggling of gold, small arms, drugs and fake currency helps terrorists in executing an attack.

Indo-Bhutan Border:

- This border (699 km) passes through states of Assam, Arunachal Pradesh, West Bengal and Sikkim.
- Illicit establishment of camps by militant outfits in the dense jungles of south-east Bhutan helps insurgents from India in executing anti-India activities.

**Indo-Myanmar Border:**

- The northeast states of Arunachal Pradesh, Nagaland, Manipur and Mizoram share the border with Myanmar (1,643).
- Some of the insurgents groups like the National Socialist Council of Nagaland (NSCN) and ULFA operate from Myanmar, which threatens the security of India as well as Myanmar.

India has had to deal with numerous challenges with respect to border management such as:

Current fence:

- The present one has a high rate of degradation due to snow and has to be repaired after every season which costs about Rs. 50-60 crore every year
- Over time infiltrators have devised ways to cross it.
- India's internal security challenges are inextricably linked with border management. This is so because Indian insurgent groups have for long been provided shelter across the nation's borders by inimical neighbours.

No real-time coordination:

- Due to the lack of understanding of military issues among the decision-making elite, India's borders continue to be manned by a large number of military, paramilitary and police forces
- Each of which has its own ethos and each of which reports to a different central ministry at New Delhi, with almost no real coordination in managing the borders.
- Border management is designed for a 'firefighting' approach rather than a 'fire prevention' or pro-active approach
- It is based on a strategy of 'reaction and retaliation' rather than on a holistic response to the prevailing environment, resulting in stress and decision making problems at the functional level.
 - Perennial and Seasonal Rivers via which terrorists can infiltrate.
 - Un-demarcated boundaries with overlapping claims cause constant friction along borders.
 - Mountainous and Hilly terrain especially in North Indian borders which are snow clad and inhabitable during winter season.
 - Unilateral actions by some nations to change the status quo in their favour.
 - Little or no support from counterparts of neighbouring nations and in some cases active support by cross border elements to illegal activities.
 - Cultural, ethnic and linguistic affinity across borders and clan loyalties
 - Multiple agencies are involved in border management, lack of Inter agency cooperation and coordination
 - Support of state and non-state actors to aid infiltration, smuggling, trafficking etc.

Significance of the relations with neighbor countries

- India advocates the policy of constructive engagement, despite such serious provocations as have been in the past (attack on Parliament, Mumbai terrorist attacks etc). It believes that violent retaliation and confrontation can only complicate the matters. This applies in particular to Pakistan- the origin of State-sponsored terrorism targeted at India.
- India adheres to its benign and noble policy of non-interference into internal affairs of other countries in the region. However, if an act – innocent or deliberate – by any country has the potential of impinging upon India's national interests, India does not hesitate in quick and timely intervention.
- Foreign policy in India by and large enjoys national consensus. At times, however, there are instances when it appears that the foreign policy is being held hostage to domestic regional politics. Bangladesh and Sri Lanka are the most glaring examples.
- India has endeavoured to deal with the government-of-the-day, be it a democracy, monarchy or military dictatorship, insisting that the choice of the form of government is best left to the people of the country concerned.
- India has skilfully used its policy of non-prescriptive development assistance as its soft power since early 1950s. In return India has sought "good will" and "friends of India". In a slight departure India is gradually switching over from pure charity to a judicious mix of outright grants and soft loans linked to project/commodity exports
- Finally, India is ready to go an extra mile in seeking the integration of the region. As often cautioned by the International Financial Institutes, only through regional cooperation can the South Asia be a part of Asian century.

Solutions for addressing cross border terrorism:

- Infrastructure along with border has to be improved – rail connectivity along with road connectivity has to be provided for quick mobilization.
- Building of additional checkpoints and Border posts along major and minor trade routes connected with borders
- Building of floating bridges, walls & electrical fences where there is high probability of infiltration.
- Taking up of joint Border management with Countries like Myanmar, Bhutan and Nepal.
- Improving healthcare, physical infrastructure and digital connectivity in villages around borders thus making them stakeholder in Border Management.
- Madhav Godbole task force recommendations on border management need to be implemented.
- It had recommended that the CRPF should be designated as the primary national level counter-insurgency force. This would enable the other central paramilitary forces like the BSF and Indo-Tibetan Border Police to return to their primary role of better border management.
- It had also recommended that all paramilitary forces managing unsettled borders should operate directly under the control of the army and that there should be lateral induction from the army to the paramilitary forces so as to enhance their operational effectiveness.
- The principle of 'single point control' must be followed if the borders are to be effectively managed.
- The advances in surveillance technology, particularly satellite and aerial imagery, can help to maintain a constant vigil along the LAC and make it possible to reduce physical deployment.

Conclusion:

Keeping a strong vigil on its border is very important for any nation to check any kind of illegal activities or intrusion through them. For India, the task becomes difficult where terrain and climate

is very complex across some of its border areas. Focussing on improved technology will help in making the task easier for the security forces and make its borders more secure.

Challenges to internal security through communication networks, role of media and social networking sites in internal security challenges, basics of cyber security; money-laundering and its prevention.

Discuss the case of Cyber bullying across the Lifespan of Education:, explain the issues and Interventions required to overcome it from family and schooling.(250 words)

Indian Express

Why this question:

The question is straight forward and is around discussing the case of Cyber bullying.

Key demand of the question:

Explain what cyber bullying is and discuss the importance of tackling it at the level of education and upbringing of values by the family.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define cyber bullying.

Body:

Cyber-bullying, in simple terms, may be defined as the act of harassment, intimidation, threatening of another person, via the cyber-space.

Explain the influence of social media on children in general.

Discuss the ill effects of cyber bullying, causes and effects.

Discuss what can be done to overcome the same.

Signify the role of family and schooling in overcoming the cyber bullying.

Conclusion:

In short, social media has had a mixed effect on children. Proper supervision by parents and teachers, and regulating the time spent on internet through various productive activities and hobbies might be regarded as some of the ways in which the ill effects of social media on children might be minimized.

Introduction:

Cyber Bullying:

- Cyberbullying or cyber harassment is a form of harassment that takes place over digital devices like cell phones, computers, and tablets.
- Cyber bullying can occur through SMS, Text, and apps, or online in social media, forums, or gaming where people can view, participate in, or share content.
- It includes sending, posting, or sharing negative, harmful, false, or mean content about someone else.
- It can include sharing personal or private information about someone else causing embarrassment or humiliation.
- Some cyber bullying crosses the line into unlawful or criminal behaviour.

Body:

Reasons for increasing Cyber bullying:

- The increasing access to affordable data service has given rise to these faceless evil worldwide – young children, in particular teenagers, being the most vulnerable victims.
- The language and content of Web series: The certain shows running on amazon prime or Netflix are not appropriate for teenagers. Teenagers try to adapt that language used in the TV series or shows.
- Nuclear families and isolation of children: Most of the families in India are nuclear families and parents are going to their job regularly so the children's get neglected and isolated. Therefore, many are not able to identify what the child is going through.
- Cyber bullying, under the Information Technology Act, is not an offence. The Act was last amended in 2008. Since then, social media has exploded in the country. The ground reality of 2017 is vastly different
- Cyber bullying does not qualify in the category of cognizable criminal offences. Only if it is in aggregated form for example, someone created fake profile of others and used that account for detrimental things that only qualifies as offence of impersonation.
- Most of the time the victim is a juvenile but at the same time the person who is committing this crime is also a juvenile and therefore this is covered under juvenile justice act. So the role of police authority in the conventional manner is limited hence registering an FIR and arresting the juvenile, these scenarios are not possible
- Under-reporting of cases. The reasons are People don't want unnecessary media publicity; the current process is very slow; and there is low confidence in the ability of the system
- The US has often failed to share information vital to dealing with cybercrime. It denies access to data held by companies such as Google and Facebook
- Because Cyberbullying is difficult to track, many victims feel helpless and unable to cope with it, especially if the bullying is personal and long-drawn

Government Initiatives against Cyberbullying:

- Guidelines by NCERT: Because of lack of awareness about cyber bullying among the children's, teachers as well as the parents, NCERT came up with three guideline booklets one for teachers one for school and one for students. For students it's in the form of DO's & DON'Ts.
- Government of India is come up with ministry of home affairs Cybercrime reporting portal gov.in.
- For generating awareness in state of Delhi, Delhi police has come up with an initiative in which Police visits school administration to get aware of cyber bullying and also engage workshops for computer teachers.

Other measures needed:

- **Family/home measures:**
 - Parents can make a vast and positive difference by talking with their children. Like sexuality education in general, the topic of pornography is not one big talk but rather a series of discussions that easily can arise from the content of songs, music videos, video games, movies and unintended or intended exposure to sexually explicit images.
 - Parents can help their children develop a critical eye when viewing media, so they see the lies, and differentiate that fiction from the joy in loving equitable and respectful relationships.

- Parents need to explain to children that the same rules apply during interactions online, as they do in person
- **Government level:**
 - **National Cyber Crime Reporting Portal** shall be designated as the national portal under-reporting requirements in the POCSO Act in case of electronic material
 - Union Government shall be empowered through its designated authority to block and/or prohibit all websites/intermediaries that carry child sexual abuse material
 - Law enforcement agencies should be permitted to brake end to end encryption to trace distributors of child pornography.
- **Use of Artificial intelligence:**
 - Tools can be developed which can analyse the behaviour of every internet user. So it can help prevent the user from falling into cyber bullying.
 - Developing some mobile applications that can alert parents if the child is under threat of cyber bullying.
 - Prevent malware attacks by tying up with antivirus agencies.
- **Academic measures:**
 - School diaries should carry an anti-bullying pledge.
 - Schools shall undertake training programmes for parents at least twice a year, making them aware of hazards for children of free access to smartphones, internet at an early age.
 - The subjects related to cyber bullying and cyber security should be made mandatory instead of only guidelines.
 - In school there should be cyber cell where one could report their grievances whether by its name or anonymously.
- Multipronged approach to handle cases:
 - Need to handle the cases of cyber bullying through multipronged approach such as counselling through Psychiatrist, approaching police, etc.

What do you understand by Juice jacking? How big is it a threat? Discuss means and ways to prevent the same.(250 words)

[Times of India](#)

Why this question:

Public USB power charging stations are now ubiquitous in the spaces business travelers frequent, including airports, hotels and other points of transit or accommodation. That's why every business traveler and organization needs to understand that these resources could be hijacked by cybercriminals as a conduit for delivering malware or stealing sensitive data.

Key demand of the question:

Discuss in detail the underlying concept of juice jacking, explain in what way it poses threats on citizens and suggest means to overcome and prevent the same.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

First define what is meant by Juice Jacking.

Body:

Juice jacking is a type of cyber-attack involving a charging port that doubles as a data connection, typically over USB. This often involves either installing malware or surreptitiously copying sensitive data from a smart phone, tablet, or other computer device.

Discuss in short then the history of Juice Jacking.

Discuss how to prevent juice jacking; Don't use public charging stations that offer USB ports. Use your own AC charging adaptor and your own cables to plug into electrical outlets. Carry a high-quality, certified mobile battery so you don't have to rely on power sources of opportunity.

Don't use somebody else's PC for charging your mobile device.

Use a USB data blocker dongle, which is a product that disables data transfer for USB cables etc.

Conclusion:

The bottom line is that juice jacking is either a rare or currently unpracticed attack that's brimming with potential for cybercriminals and spies. Because the remedies are so easy and inexpensive and tend to offer other benefits as well, it makes sense to integrate anti-juice jacking measures into the organization's overall cybersecurity plans.

Introduction:

Juice jacking is a type of cyber-attack involving a charging port that doubles as a data connection, typically over USB. This often involves either installing malware or surreptitiously copying sensitive data from a smart phone, tablet, or other computer device.

The power/data cable that we see in public charging stations, provides unauthorized access to attackers during the charging process; leveraging illegitimate access to get our personal information taken away.

Body:

Threats posed:

- **Data theft:** During the charge, data is stolen from the connected device. Once the device is plugged-in and connection is established, it either installs malware or secretly copies sensitive data from a smartphone, tablet, or any other computer device.
- **Malware installation:** As soon as the connection is established, malware is dropped on the connected device. The malware remains on the device until it is detected and removed by the user. The attack could be as simple as extracting all your contact details and private pictures or can be an invasive attack of injecting malicious code directly into your device which can then copy all your passwords of financial data.

Measures to protect from juice jacking:

- **Keep your devices fully charged or carry personal charger/power bank with you.** Alternatively, always keep your charger and power bank in your bag for charging to maintain control over the data port.
- **Lock Your Phone:** When your phone is locked, I mean truly locked and inaccessible without the input of a PIN or an equivalent pass code, it cannot be paired with any device. Be cautious not to

use your face/finger print id for even a second since pairing can happen within a flick of a second.

- **Switch off or Power the phone down:** This technique only works on few mobile models as some phones, despite being powered down, still powers on the entire USB circuit and allows access to the flash storage in the device.
- **Use specialized cables:** You can buy a special USB cable that doesn't have pinout connections for pins 3 and 2. Therefore it's impossible to transmit data across the connection.
- **Use a USB condom:** It is a device that goes between your normal data charging cable and a USB port to block data transfer through the connection. USB condoms are adaptors that allows power transfers but don't connect the data transfer pins. You can attach them to your charging cable as an "always on" protection.

Conclusion:

The best defence against any such attack is awareness. Follow the above tips, and avoid plugging your mobile into unknown charging stations the same way you avoid opening attachments from unknown senders.

INSTA SECURE SYNOPSIS

MAINS 2020

GS-III

MARCH 2020

Indian Economy and issues relating to planning, mobilization of resources, growth, development and employment.

“The coronavirus is driving the world into a recession, and India cannot be insusceptible to it”, do you agree with the statement? Critically analyse. (250 words)

Reference: [The Hindu](#)

Why this question:

The article presents a detailed discussion on the global spread of the coronavirus and the economic impact.

Key demand of the question:

The answer must discuss the impact of the Corona virus on the economy of the world in general and in what way India is no exception to it.

Directive:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgment.

Structure of the answer:

Introduction:

Briefly explain the spread and coming of the corona virus outbreak.

Body:

Discuss the global impact – The virus has crippled global supply chains, hit air travel and affected markets.

The Chinese economy is in deep trouble due to the impact of the virus and the virus appears all set to adversely impact the U.S. economy, the global economic engine.

S. companies ranging from Apple and Nvidia to Procter & Gamble and Adidas are facing troubles because of their large exposures to the Chinese market or their reliance on suppliers from China. A slowdown or worse, recession, in the two global economic engines may push the entire world economy into recession.

Markets reflected these concerns as important indices plunged and investors pulled out money.

Unlike a financial crisis which can be sorted out with measures such as rate cuts and bail-outs, the present crisis is immune to financial solutions.

Then discuss specifically the impact on Indian economy.

Conclusion:

Conclude with what needs to be done to overcome the ill-effects of such a global epidemic.

Introduction:

The human cost of the coronavirus outbreak is climbing across China and beyond. The economic cost is also mounting. That damage is, for the most part, not due to the virus itself, but due to efforts to prevent it from spreading. The global economy appears headed for uncharted, troubled territory thanks to the second wave of the coronavirus that has now spread to countries as far apart as Nigeria and New Zealand.

Body:

Economic effects of the coronavirus on the Indian Economy:

- The impact on India is felt through supply chain disruptions from China as well as regional players, who in turn are net importers from China.

- India's annual trade with China is around \$90 billion—India imports goods worth \$75 billion and exports goods worth \$15 billion.
- These include 'electrical and telecom machinery,' 'organic chemicals,' 'nuclear reactors,' 'plastics' and 'pharmaceuticals.' The first four of these five groups also make up India's top imports in 2019 fiscal year.
- On account of factory closures in China, supply chains would get disrupted and this could result in shortages, especially of electronic goods and medicines.
- A key supplier of generic drugs to the global market, Indian companies procure almost 70 percent of their active pharmaceutical ingredients for their medicines from China.
- Trade deficit prints may be lower for the next couple of months. We may see the price of consumer durables inch higher. This would drive core inflation higher, which is showing signs of bottoming out.
- This, in turn, could make it more difficult for the MPC to provide further monetary policy stimulus. January's core inflation print came in at 4.2 percent compared to December's 3.8 percent.
- Fall in global crude prices on account of an anticipated slowdown in demand would also result in a lower import bill. The sectors that are likely to be impacted on the export front are diamonds, leather and petrochemicals
- Imports are likely to contract more than exports and therefore, from a current account perspective, the outbreak could actually be rupee-supportive.
- Offshore fundraising by Indian corporates is also likely to slow down, as raising money onshore has become cheaper after the LTRO announcement by the RBI
- The retail mobile trade, for instance, is almost entirely dependent upon China. While every month, old models of mobile phones would see a drop in prices as new models are supplied, in the current month, no such drop in prices has taken place and the supply of goods is being rationed by companies
- The toy market sees nearly 80% of its demand met by products made in China, while only 20% is met by Indian manufacturers
- Many items, like belt buckles, Christmas lights, specific parts of gas stoves, are only made in China. The prices of most of these goods had already seen an upward correction, and in some cases it is as much as 50%
- The travel and tourism sector will be affected badly. Several overseas airlines have stopped flights to China and international hotel chains have also been offering refunds. Most of the Chinese citizens are avid travellers, hence the tourism in other countries might feel the ripple effect.

Global impact:

- The world's economy could grow at its slowest rate since 2009 this year due to the coronavirus outbreak, according to the Organisation for Economic Cooperation and Development (OECD). The OECD has forecast growth of just 2.4% in 2020, down from 2.9% in November 2019
- Some people are choosing to avoid activities that might expose them to the risk of infection, such as going out shopping. Restaurants, car dealerships and shops have all reported a fall in customer demand.
- The number of cases diagnosed is increasing around the world every day. Thus, many countries have introduced travel restrictions to try to contain the virus's spread, impacting the travel industry massively.

Some shining light for India:

- Indian companies are not major participants in the global supply chains originating in China.
- The crude oil prices are slipping which is good news for the macro economy and inflation.
- The government needs to watch the developing situation and, for now, do all it can to support industries that are reliant on Chinese inputs.

Conclusion:

It is critical to mount a coordinated and coherent response. This not only means involvement of both public and private sectors but also allopathic and non-allopathic medical systems, different departments such as police, fire, transportation, tourism, food supplies and other sectors.

Discuss the concept of “Limited liability partnership” while bringing out the benefits and concerns associated with a special reference to Indian economy. (250 words)

Reference: [Financial Express](#)

Why this question:

The government is set to introduce an amnesty scheme for Limited Liability Partnership (LLP) firms for delays in mandatory filings which could benefit 20-25 per cent of the 1.25 lakh LLPs registered in the country. Thus the question.

Key demand of the question:

The answer must discuss the significance concept of “Limited liability partnership” while bringing out the benefits and concerns associated with a special reference to Indian economy.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly define what LLP is.

Body:

Start with the recent decisions made with respect to the move – it is aimed at bringing non-compliant LLPs into the legal fold. Explain – LLP is an alternative corporate business firm that gives the benefits of limited liability of a company and the flexibility of a partnership. Highlight the key features of LLP.

Discuss that ; LLP form is a form of business model which – is organized and operates on the basis of an agreement.

Provides flexibility without imposing detailed legal and procedural requirements.

enables professional/technical expertise and initiative to combine with financial risk taking capacity in an innovative and efficient manner.

List down the concerns associated while suggesting way forward.

Conclusion:

Conclude by reasserting the significance of such concepts applied to the economy.

Introduction

Limited liability Partnership, is an alternative corporate business vehicle that provides the benefits of limited liability of a company, but allows its members the flexibility of organizing their internal management on the basis of a mutually arrived agreement, as is the case in a partnership firm.

Body

The LLP as a separate legal entity, is fully liable of its assets but liability of the partners is limited to their agreed contribution in the LLP.

- It limits the liability of partners as far as civil cases are concerned.
- In such a partnership, partners can't be held liable for another's misconduct or negligence.
- It is governed by the provisions of the **Limited Liability Partnership Act, 2008**. The LLP Act 2008 confers powers on the Central Government to apply provisions of the Companies Act, 1956 as appropriate.
- Central Government also has powers to investigate the affairs of an LLP, if required, by appointment of competent Inspector for the purpose.
- Registrars of Companies (ROC) is appointed under Companies Act and is under Ministry of Corporate Affairs.
 - Its primary duty is to register companies and LLPs under respective states and UTs and ensure their compliance with statutory requirements.

Benefits of LLP

- **Convenience:** It is easy to start and manage a business, like entrepreneurs. **LLP agreements** are customized in according to meet the needs of partners concerned. There is fewer formalities in areas of legal compilation, annual meeting, resolution as compared to any other **Private Limited Company**.
- **No minimum capital requirement:** LLP can be started with the minimum amount of capital money. Capital may be in the form of tangible, movable asset like Land, machinery or intangible form.
- **Lower Registration cost:** This requirement in the case of a Private company (Requirements for Registration of a Private Company) and Public Company (Requirements for the registration of a Public Company) is Rs. 1, 00,000 and Rs. 5,00,000 respectively whereas no such mandatory capital requirement specified under the LLP.
- **Number of owners:** LLP may have partners varying from 2 to many. There is no limit for partners in LLP. An LLP requires a minimum 2 partners while there is no limit on the maximum number of partners in contrast to a private company wherein there is a restriction of not having more than 200 members.
- **No compulsory audit:** LLPs are not required to audit the accounts. Any other company (Public, Private) are mandated to get their accounts audited by the auditing firm. LLP is required to audit their account in the following situation: When the contributions of the LLP exceeds Rs. 25 Lakhs, or When annual turnover of the LLP exceeds Rs. 40 Lakhs
- **Low tax burden:** LLPs are also tax efficient as they are exempt from dividend distribution tax and minimum alternative tax.
- **Low compliance burden:** LLP have to face less compliance burden as they have to submit only two statements i.e. the Annual Return & Statement of Accounts and Solvency. Whereas in the case of private company, at Least 8 to 10 regulatory formalities and compliances are required to be duly completed. Read Annual Cost Comparison of Private Limited and LLP.
- **Easy Transferable Ownership:** It is easy to become a Partner or leave the LLP or otherwise it is easier to transfer the ownership in accordance with the terms of the LLP Agreement.

Concerns Regarding LLP

- **Penalty for non-compliance:** Even if an LLP does not have any activity, it is required to file an income tax return and MCA annual return each year.

- In case an LLP fails to file Form 8 or Form 11 (LLP Annual Filing), a **penalty of Rs.100 per day**, per form is applicable.
- There is no cap on the penalty and it could run into lakhs if an LLP has not filed its annual return for a few years.
- **No equity investment:** An LLP does not have the concept of equity or shareholding like a company. Hence, angel investors, HNIs, venture capital and private equity funds cannot invest in an LLP as shareholders. Thus, most LLPs would have to rely on funding from promoters and debt funding.
- **Blanket tax rate:** The income **tax rate for a company** with a turnover of upto Rs.250 crores is 25%. (Further reduced in 2019 for new companies involved in manufacturing).
 - However, LLPs are taxed at a **30% rate** irrespective of the turnover.

Conclusion

India has around 1.25 lakh active LLPs, of which a majority are in business services, followed by trading, manufacturing and real estate & renting. Ease of doing business and making regulations easier for LLP's can go a long way in increasing efficacy of various sectors of Indian Economy.

Discuss the role of women in evolving a knowledge economy and narrowing the gender inequality in the Indian context. (250 words)

Reference: [Live Mint](#)

Why this question:

The article discusses at length the possible contributions that the women are making to the knowledge economy in the country.

Key demand of the question:

The answer must discuss the significance of women in evolving a knowledge economy and narrowing the gender inequality in the Indian context.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain what knowledge economy are.

Body:

Highlight that the Indian economic success requires scientific skills that can foster a knowledge economy, the emergence of which depends on how gender balanced the workforce is. Explain the present scenario – list down the challenges that women face in contributing to the knowledge economy. Then explain why women are key to the economy despite the above mentioned concerns and challenges? Highlight their potential.

Conclusion:

Conclude by policies of the government in this direction; explain what should be done to harness the contribution of women to the knowledge economy.

Introduction

“You can tell the condition of nation by looking the status of the women” – Pt. Jawaharlal Nehru

The knowledge economy is a system of consumption and production that is based on **intellectual capital**. In particular, it refers to the ability to capitalize on scientific discoveries and basic and

applied research. In a knowledge economy, a significant component of value may thus consist of intangible assets such as the value of its workers' knowledge or intellectual property.

The World Bank defines knowledge economies according to four pillars:

- Institutional structures that provide incentives for entrepreneurship and the use of knowledge
- Availability of skilled labor and a good education system
- Access to information and communication technology (ICT) infrastructures
- A vibrant innovation landscape that includes academia, the private sector, and civil society

Body

Women in Knowledge Economy in India

A rapidly growing India requires a highly skilled technical workforce that is crucial for developing a knowledge economy. Unfortunately, half the scientific potential of India i.e. women in science—is squandered.

- Women make up only **14% of the 280,000** scientists, engineers, and technologists in research and development institutions across the country, according to a recent study.
- Over the years, the interest to study STEM has increased. According to a MasterCard study, over 85% of girls between the ages of 12-14 want to pursue studies in these fields.
- In the field of Artificial Intelligence, the gender gap stands at 72% (only 22% are women)

Challenges faced by women

- When highly qualified women drop out of the workforce, it results in considerable depletion of national resources and our ability to flourish in knowledge economy.
- **Gender based social roles** are imposed on women. Stereotypes encountered by girls to the family-caring responsibilities.
- Women continue to face the same kind of discrimination at work as they face in society.
 - According to a recent Accenture research report, the gender pay gap in India is as high as **67 percent**.
 - It is certainly more challenging for women pursuing science to excel due to the various hurdles they face and the bias that operates against them in almost all institutions
- **Peer-reviewed research reports** have indicated that women scientists earn less, have less prestige within departments, have less lab space, are offered inadequate jobs on graduating with science degrees and have more teaching responsibilities.
- They also face greater difficulty in receiving grants, and therefore apply for fewer grants in the first place.
 - It is imperative to tackle these issues with vigour if India is to take its rightful place among developed nations.
- **Women tend to lack access to informal networks** that provide opportunities to work in high-profile projects, which include attending conferences abroad or on-the-job opportunities.
- When it comes to **peer recognition**, women are at loss as they muster less support.
- The most important one is mindset, which has been targeting women right from their cradles.

- **Unequal Opportunity** : Women have less access to resources — such as property, financing, technology and education — needed to support active engagement in science, technology, engineering, research and innovation. As a result, their presence in employment, entrepreneurship and research is lower than men's.
- **Due to family pressure and household responsibilities**, many female graduates fail to convert their degree into a fulfilling career or stop pursuing managerial and leadership roles.

Therefore, they **lack the work experience** that would enable them to rise up the ranks and provide access to the wide range of developmental models that could **build the credibility they need to advance**.

Women are key to economic growth

- India could boost its growth by **5 percentage points to 9 percent** per year if around 50% of women could join the work force. Even more if women are educated and are included in the knowledge economy, as per the World Bank
 - Conversely, it is estimated that **gender gaps cost** the economy **some 15 percent of GDP**.
- It is estimated that companies with three or more **women in senior management functions** score higher in all dimensions of organizational performance.

Way forward

- Educational institutes and the community should encourage girls from primary school to select a STEM field for their higher education.
- In our educational system, there is too much of categorisation that starts too early. Science including physics, chemistry, mathematics and biology should be taught for all up to the 12th grade.
- Steps can be taken to strengthen technical education in women's institutions.
- Special managerial skills through training and development programmes.
- Corporates and public sector must increase their gender diversity and target must be at least 50% of the workforce.
- National level science conferences that are women centric, highlighting achievements of women in knowledge economy will prove to be an inspiration.
- Handholding programmes by government to provide tangible support to women entrepreneurs.
- Strengthen the maternity benefits and aiding women to ensure work life balance.
- The importance and benefits of team work, networking and being proactive should form an important part of soft skill training offered for women.

Conclusion

Science needs the **best scientists**, and a knowledge economy needs a **gender-balanced workforce**. This can only be attained by **realizing the full potential of women**. Apart from being wasteful and unjust, the **under-representation of women in science** threatens the goal of achieving excellence in the field.

To tackle this, we must set an **ambitious target of reaching out to 1 million young girls each year**, and encourage them to take up science and make a difference. A **national convention of women** in science must be held annually, with a specific focus on discussing and building general awareness around the major challenges that women face.

Explain the concept of Agroforestry. Discuss how agroforestry could solve climate crisis. (250 words)

Reference : [Down to Earth](#)

Why this question:

Agriculture and climate change are deeply intertwined. Agriculture is responsible for almost 30 per cent of global greenhouse gas (GHG) emissions and is the root cause of 80 per cent of tropical deforestation. Intensive agriculture — characterised by monocultures and aimed at feeding farm animals — is one of the sectors that generates the highest amount of CO₂ emissions.

Key demand of the question:

One must discuss in detail the concept of Agroforestry. The benefits of Agroforestry and how it can help tackle the climate change crisis being faced across the globe and India

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In brief explain the scenario of how agriculture and monoculture has led to increasing emissions of GHG's and adding to the climate change crisis

Body:

Explain the concept of Agroforestry in detail.

Discuss how Agroforestry can help mitigate the climate change effects.

Use case studies which has proven to be successful across the globe to substantiate your answers.

Give a brief idea about the agroforestry potential in India.

Conclusion:

Conclude with a way forward.

Introduction

Agroforestry is a collective name for sustainable land-use systems involving trees combined with arable crops and/or livestock on the same unit of land, either spatially or temporally. Agroforestry can be classified into Agrosilvicultural systems, Silvopastoral systems and Agrisilvipastoral systems.

Body

Features of Agroforestry

- It has more than one crop at a time in which atleast one crop must be tree crops
- It produces multiple outputs such as food, fodder, fuel and timber.
- Crops are arranged in a multi-storey in such a way that it reduces competition among plants

Agroforestry Classification

▪ **Agrisilvicultural systems:**

- Arable crops are suitably mixed with tree crops under Taungya System.
- In another method, fuel wood species are inter-planted around agricultural lands. This system acts both as fence as well as shelter-belts besides providing fuel wood to local community. Eg : Acacia Nilotica, Dalbergia sisoo (Shisham) etc.
- Alley cropping where woody plants are grown in rows with annual crops is also a type under this system.

- **Silvipastoral system** : It refers to the production of woody plants in pasture lands.
 - Eg : Live fence of fodder trees and hedges.
- **Agrisilvipastoral system**: It refers to the production of woody perennial along with annuals and pastures.

Agroforestry and solution to Climate crisis

Farming is responsible for almost 30% of global greenhouse gas emissions. Agriculture is the root cause of 80% of tropical deforestation. Regenerative agroforestry, an agricultural method that mimics natural ecosystems, could help reverse these trends.

- **Carbon Sink** : Regenerative agroforestry sequesters significantly more carbon than industrial agriculture and can help to restore degraded land. According to UN Scientists, restoring 900 million hectares could stabilize global GHG emissions for 15-20 years. With agroforestry, we can transform degraded land into food-growing carbon sinks.
- **Microclimate** : It improves the microclimate of a region by lowering of soil temperature, reduction of evaporation and maintenance of soil moisture.
- **Improve soil management**; deep-rooting trees improve soil stability; trees increase the soil's ability to absorb and retain water, produce nutrients, improve and maintain organic soil matter and manage soil temperature.
- **Improve carbon sequestration**; during the photosynthesis process, the tree absorbs carbon from the atmosphere. Studies have shown that a tropical tree absorbs about 22kg of carbon each year. By using this practice, farmers can significantly mitigate climate change;
- **Lessen** the risk of **salinization** in coastal areas
- **Protecting the biodiversity** : The diversity of plants creates biomass throughout the year, fertilizing the soil and increasing crop yields while providing fodder for livestock. Moreover, planting trees on a farm protects crops from wind and sunlight. It increases efficiency of land and eliminates need to expand into biodiversity rich areas.

Conclusion

Agroforestry is a resilient and future-proof agricultural method that could help solve the climate crisis. This smart farming system enables economically viable production while restoring land, mitigating climate change, protecting biodiversity and enhancing food security for growing populations. It's a nature-based practice that is globally applicable and an affordable promising solution to today and tomorrow's biggest global challenges.

Discuss the factors that ail India's Free Trade Agreements. Explain what factors are necessary for efficient functioning of trade regime. (250 words)

Reference: [Financial Express](#)

Why this question:

The article brings out the factors that plague India's FTAs.

Key demand of the question:

The answer must discuss the factors that ail India's Free Trade Agreements. And bring out the factors that are necessary for efficient functioning of trade regime.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

**Introduction:**

Briefly highlight the significance of trade in general.

Body:

Explain the factors that are ailing India's FTA.

Discuss why India is skeptic of free trade and is opting for protectionist policies.

Bring out the defects in the current regime.

Suggest what needs to be done.

Conclusion:

Conclude with way ahead.

Introduction:

Free trade agreements are a key to creating seamless trading, but there are genuine concerns when India signs up new such pacts because of past experience. However, a growing wave of protectionism has dominated global trade of late. While it is difficult to assess whether this will lead to a significant shift in the global trade paradigm, a review of India's existing free trade agreements (FTAs) before negotiating new ones is necessary.

Body:

So far, India has signed 14 FTAs. The impact of all these FTAs on the economy, and especially on the agriculture sector has been disastrous. Among these, the India-Sri Lanka and ASEAN-India FTAs had the greatest negative impact on the Indian agriculture sector. India decided against joining RCEP at the eleventh hour. The official version is that India runs a large trade deficit with RCEP countries, and was expecting specific protection for its industry and farmers from a surge in imports, especially from China.

Factors that ail India's Free Trade Agreements:

- The poor negotiations of FTAs under previous governments have harmed Indian industry, and led to a distorted trade balance.
- In general, an FTA, by changing the rule of the existing trade regime, may increase the transaction cost of trading turns out to be inefficient due to additional complexity.
- The concerned officials for enforcing the rules are not well-versed with their intricacies. Further, policymakers hardly pay attention to this.
- Another shortcoming in the architecture of India's FTAs is the avenue of discretionary power of officials in judging tariff concession claims. Both these add to transaction costs.
- Packaging and labelling issues are also not well-defined under FTAs, raising the compliance cost of availing concessions under the agreement
- High cost of packaging affects competitiveness of exports in the international market.
- shortage of proper storage facilities at ports, especially for items requiring cold storage, the possibility exists that traders suffer loss due to damage of goods.
- Certification is an issue that needs attention at the time of signing of FTA if the interests of traders/manufacturers are to be protected.

Case study: *India-Sri Lanka FTA (ISFTA), one of the earliest FTAs India signed, and for which more evidence is available from our recent in-depth study. In 2005, 98% of Sri Lankan exports availed the FTA route. This has declined to about 50% in recent years. On the other hand, only 13% of India's exports are routed through FTA. Surely, no one expects this trend to be exhibited after signing an FTA. Some argue that this fall in the share of utilization of the FTA route is due to the implementation of the SAARC Free Trade Agreement (SAFTA) post 2006, and most Indian exporters are using the SAFTA route. This logic falls apart since the rate of tariff concession is higher under ISFTA (up to*

100%) than under SAFTA (up to 20%). The question, then, is why exporters on either side are reluctant to avail benefits of ISFTA.

Measures needed for efficient functioning of FTA's:

- policymakers must pay enough attention to creating a complementary ecosystem, in terms of trade facilitation measures for efficient functioning of the trade regime, at the time of signing of FTA.
- labelling regulations should be clearly defined and made available to traders, it makes compliance easy, and would not cause problems in clearing shipments
- Since government authorities function at their own pace, there is a need for a system of third-party certification from private entities in partner countries.
- The FTAs can ensure market access to only the right quality products made at competitive prices.
- Improvement in firm-level competitiveness is a must.
- Negotiating bilateral FTAs with countries where trade complementarities and margin of preference is high may benefit India in the long run.
- Also, higher compliance costs nullify the benefits of margin of preference. Thus reducing compliance cost and administrative delays is extremely critical to increase utilization rate of FTAs.
- Proper safety and quality standards should be set to avoid dumping of lower quality hazardous goods into the Indian market.
- Circumvention of rules of origin should be strictly dealt with by the authorities.
- Well-balanced FTA deals addressing the concerns of all the stakeholders are the need of the hour.

Conclusion:

There is a need to revisit all FTAs, and introduce an autonomic decision-making process to strengthen principle-based economic judgments, thereby reducing transaction costs of trading.

Should distressed private banks be saved by PSBs? Do you agree to the fact that larger PSBs are being made more fragile by involving them in bailouts of their public sector or private peers? Discuss. (250 words)

Reference: [The Hindu](#)

Why this question:

A day after the government imposed a moratorium on the financially troubled Yes Bank last week; the Reserve Bank of India announced a draft restructuring plan that entails the State Bank of India acquiring a 49% stake in the private lender. Thus the question.

Key demand of the question:

The answer needs to explain why the private banks need to be saved by the public sector banks, what are the issues and challenges involved and what an optimal solution to address such a situation is.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

In short present the background of the context in question.

Body:

First explain why such banks should be saved; list the reasons. As per the Financial Stability Report of the RBI, the level of inter-connectedness within the financial services ecosystem is deep. While after the global financial crisis, the idea was always to have no bank which is too big to fail.

The systemically important banks are banks which are tracked more carefully and which are also subject to higher capital requirements under Basel III. But that is not to say that banks which are relatively smaller in size, such as Yes Bank, do not pose systemic risk and therefore, should not be rescued.

Then explain what should be done –

The first option should always be to have a private investor come in and infuse his capital into the private bank.

The next option then, the straightforward option, would be for the government to simply nationalize the stressed bank. It happened during the global financial crisis with innumerable private banks all over the world.

Suggest other solutions.

Conclusion:

Conclude with way forward.

Introduction:

The government recently imposed a moratorium on the financially troubled Yes Bank last week, the Reserve Bank of India announced a draft restructuring plan that entails the State Bank of India acquiring a 49% stake in the private lender.

Body:

|--|---|

The distressed banks need to be saved as they have the following implications:

**▪ Impact on stakeholders:**

- There are many depositors both big and small who have their deposits in Yes Bank. They would lose hugely if Yes Bank is allowed to collapse, given the fact that the account holders are insured for up to Rs 5 lakh only by the Deposit Insurance and Credit Guarantee Corporation (DICGC).
- Firms and agents dependent on Yes Bank for credit to keep them in business may find their operations disrupted and new credit lines difficult to find.
- Though the scheme ensures that the employees would retain their enumeration and service conditions for a year, the employees may lose their jobs in the future if there are efforts to cut down on the operating costs of the bank.

▪ Impact on the larger economy:

- The Yes Bank crisis can have a profound impact on the larger economy. Similar observations have also been made by SBI chairman claiming that Yes Bank cannot be allowed to fail since that would have consequences for the Indian economy.

▪ Decreased trust in the financial system:

- The investors choose private lenders like Yes Bank, mainly attracted by the higher interest rate offered by them. The collapse of Yes Bank would most likely set off a chain of withdrawals from other private banks as well as some weaker public banks. This could pose a systemic threat to the country's financial system.
- There would also be adverse spin-off effects on investors in bonds and instruments issued by Yes Bank, triggering turmoil in other parts of the financial system.

▪ Spin-off effects:

- Firms and agents dependent on Yes Bank for credit to keep them in business may find their operations disrupted and new credit lines difficult to find. That could lead to their defaulting on debt they owe other creditors. This could increase the overall NPA in the financial systems.
- Ancillary businesses downstream may collapse or turn sick, leading to job losses and loss of livelihoods.
- Assets and machinery may lie idle and the ripple effect may grind other well-performing businesses to a halt as the cycle of debtors and creditors freeze.

▪ Ineffectiveness of regulatory framework:

- In spite of the many laws and regulations imposed by the Companies Act and those stipulated by the Securities and Exchange Board of India and compliance requirements under the oversight of the Reserve Bank of India (RBI), Yes bank failed.
- This calls into question the effectiveness of the present regulatory framework.

Concerns with the resolution plan:**▪ Lack of confidence:**

- A major aspect of the restructuring plan is based on the following principles.
- Yes Bank will not be merged with the SBI, but become a standalone subsidiary of SBI. SBI's equity could be sold off in a future date if that proves feasible.
- Investors other than the SBI must play an important role in the revival of Yes Bank, since the equity of the bank is expected to rise, with the SBI holding only 49% of the total.
- Yes Bank's troubles with non-performing assets are an indication of the troubles in the borrower industries as well, ranging from real estate to power and non-banking financial companies. With the economy facing a persistent slowdown, the prospects of banks' burden of bad loans easing soon are limited.
- Given the gloomy economic climate, investors may not be willing to outlay large sums on equity of Yes Bank. Lack of confidence and the absence of investor support may render the whole exercise ineffective.
- If the RBI's scheme does not work and the investment is not recovered, the SBI's stakeholders which consist of the government and taxpayers will have to bear the burden.
- **Timing of the intervention:**
 - There have been reports of governance failures, accounting irregularities and balance sheet weaknesses at Yes Bank for more than two years.
 - The fact that Yes Bank had not been placed under the Prompt Corrective Framework of the RBI seems to suggest that the current intervention has been much delayed. It is because of the delay that escalated intervention is unavoidable.
- **Effectiveness of the intervention:**
 - There are doubts regarding the effectiveness of such a resolution. There are risks associated with the restructuring plan.
- **Estimates on the necessary capital:**
 - The estimations from SBI places notes that Yes Bank would need about ₹20,000 crores for its reconstruction plan.
 - However, the fact that Yes Bank had ramped up its lending in recent years and had large exposure to bankrupt or heavily indebted corporate groups, casts doubts over the adequacy over the ₹20,000 crore estimate.
- **Provisions regarding AT1 bonds:**
 - The scheme had exclusive provisions regarding the additional tier 1 bonds (AT1 bonds) issued by the bank. The scheme stated that the AT1 bonds totaling close to ₹11,000 crores, would be written down permanently, as part of the restructuring plan.
 - AT1 bonds offer investors a higher return because of the higher risk associated with them, including the possibility of being written down when a bank's equity base is under threat.

- Investors in the AT1 bonds are likely to approach the courts, hampering the restructuring process.

Way forward:

▪ Legislative and administrative changes:

- Given the fact that boards are responsible to the shareholders and also ultimately accountable to the statutory authorities and the fact that the independent directors serve at the discretion and pleasure of the promoter-CEO, one cannot expect the directors to remain truly 'independent' in their duties.
- Necessary changes in the Companies Act and rules issued by RBI and SEBI must address these issues.

▪ Improving regulatory checks:

- The market regulators, the RBI and other statutory authorities must consider reviewing the guidelines and rules and incorporating necessary changes.
- Given the pattern in the failure of promoter-driven entities, the regulators need to focus on addressing related issues.
- There is a need for reforms to strengthen the autonomy of various regulatory institutions.

▪ Punish corporate transgressions:

- Though corporate transgressions happen in the West too, the regulators do not spare the promoter, despite his or her credentials.
- Elon Musk was recently penalized for issues related to insider trading. Bill Gates or Mark Zuckerberg, have often been reined in, investigated and heavily fined.
- India needs to learn from these examples and improve regulatory checks and balances.

▪ Protecting the interests of the employees and customers:

- Regulators through the restructuring plan should not punish the company for the sins of its promoters. All efforts must be made to save the company and jobs.

Elucidate upon the need for urgent reforms of financial markets in the country with special focus on the comprehensive structure that is required to regulate banks, non-bank lenders, and insurance companies. (250 words)

Reference: [Financial Express](#)

Why this question:

The author highlights the need to urgently rethink on the financial regulation aspects in the country.

Key demand of the question:

Discuss in detail the need for urgent reforms of financial markets in the country with special focus on the comprehensive structure that is required to regulate banks, non-bank lenders, and insurance companies.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Explain what you understand by financial regulation is short.

Body:

Discuss first how India can't rely only on RBI to regulate the credit market; there have to be clean lines of responsibility as to who regulates which sector.

Explain what the issues the current financial regulators are facing and why there is need for a better system to be put in place.

Use the case of Yes Bank collapse and present your arguments effectively.

Conclusion:

Conclude with way forward.

Introduction:

The collapse of Yes Bank has told us that—following on the collapse of bank and non-bank credit, and the logjam on the IBC proceedings—the Indian economy has to face up to an urgent, drastic and far-reaching restructuring of banking and credit institutions in India. India can't rely only on RBI to regulate the credit market. There have to be clean lines of responsibility as to who regulates which sector.

India's policymakers must create one financial watchdog with jurisdiction over debt, equity, pension and insurance instruments. It is no longer viable to maintain walls between markets regulator Sebi, debt and banking regulator Reserve Bank of India (RBI) and insurance watchdog Irda.

Body:

Need for urgent reforms of financial markets in the country:

- The time is past when India could afford crony capitalism, inefficient socialism and corrupt private sector behaviour and judicial delays that have cost up to 2-3 percentage points of GDP growth each year over the past several years.
- Some of the recent events in Indian Economy: The collapse of Yes Bank has told us that—following on the collapse of bank and non-bank credit, and the logjam on the IBC proceedings.
- The collapse of IL&FS, from issuer of quasi-sovereign bonds to a wreck that threatens to take down other institutions, exposed the fragility of shadow banks — called non-banking finance companies (NBFCs) — regulated by RBI.
- Real estate companies such as Amrapali have been rebuked by the courts. In these matters, the victims are not other banks or companies, but individuals.
- Financial transactions costs of doing business in India must be one of the highest in the world. The government did pass the IBC, and it was expected that creditors would be able to recover their dues from borrowers.
- We have noticed that debtors have used every trick in the book to thwart the orders of the specialist court and imposed costs on the creditors. The entire effort to clean up NPA mess has been frustrated by clever debtors.
- Currently, the banking, capital markets and insurance sectors in India are regulated by multiple regulators, i.e. RBI, SEBI and IRDAI.
- The dynamic nature of business necessitates a high degree of inter-regulatory coordination. It also requires regular clarifications and frequent amendments in the existing regulations governing financial activities.

- The development of financial services and products would require focused and dedicated regulatory interventions.
- It is the ordinary tax payer—direct plus indirect tax payer—who bears the burden of the badly regulated credit market. Indian tax payers are not organised for political lobbying. The government often throws money at any problem which exposes a weakness such as farmers' debts.
- The government (of all parties) happily throws money at each problem—farmers distress, inability to repay debt, drought or too much rainfall. It is time tax payers asked some tough questions.
- The Indian economy has become much more like a developed economy than it was even 20 years ago. The current drop in GDP growth rate is due to the uneven supply of credit at exorbitant prices. It is no longer a bullock cart where the government can use physical controls.
- India's economy will generate prosperity only if it lets private sector play a fuller, grown-up and responsible role in the way the economy generates growth.

Way forward:

- Thus, India cannot rely on just RBI to regulate the credit market. There have to be clean lines of responsibility as to who regulates which sector.
- The judicial arm has to be made part of the reform strategy.
- A unified financial regulator in India would provide world class regulatory environment to financial market participants. This also be essential from an ease of doing business perspective.
- The unified authority would also provide the much needed impetus to further development of Indian Economy in India in-sync with the global best practices.
- India needs to set up a Commission to propose a comprehensive structure to regulate banks, non-banking lenders, insurance and stock trading.

Conclusion:

The only way to keep investors safe from corporate opacity and lack of coordination among regulators, is to leave RBI with monetary policy and macro prudential regulation and assigning oversight of all other financial conduct to another agency. A converged financial market needs a converged watchdog.

Why is the Indian currency weakening? Discuss the factors contributing to it while suggesting measures to overcome it. (250 words)

Reference: [The Hindu](#)

Why this question:

The Indian rupee fell sharply against the U.S. dollar to a record closing low of 75.20 as deepening concerns about the economic fallout of the COVID-19 pandemic sent global investors hurrying to dump most assets, especially emerging market holdings, and opt for cash and the relative safety of the greenback. Thus the question.

Key demand of the question:

The answer must explain the reasons for the currency weakening in the country and factors responsible for it.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

**Introduction:**

Briefly explain that as it happened in 2008 during the Global Financial Crisis (GFC), the widespread economic uncertainty triggered by the latest COVID-19 outbreak has forced most investors and businesses across the world to seek to conserve that most crucial asset during times of crisis: cash and more specifically the U.S. dollar.

Body:

List down the contributing factors one by one.

Explain the effect of COVID-19; The depreciation is even more worrisome as the month of March is typically good for the Indian rupee as remittances, from both individuals and companies tend to buoy the exchange rate.

The yellow metal too has been sold by investors looking to hold the most liquid and most fungible of all assets — the U.S. dollar.

Discuss the possible balancing factors available.

Conclusion:

Conclude that the outlook on the rupee will be precarious for the next few days. If there's meaningful coordinated action from global central banks and governments, some calm could return to the markets.

Introduction:

The Indian rupee slumped on Friday to a record closing low of 75.20 against the U.S. dollar as deepening concerns about the economic fallout of the COVID-19 pandemic sent global investors scurrying to dump most assets, especially emerging market holdings, and opt for cash and the relative safety of the greenback. The rupee has now depreciated by more than 5.3% in 2020, with the bulk of its losses, a 4.1% slide, having occurred in March.

Body:**Reasons for weakening of Indian currency:**

- During the Global Financial Crisis (GFC) 2008, the widespread economic uncertainty triggered by the latest COVID-19 outbreak has forced most investors and businesses across the world to seek to conserve that most crucial asset during times of crisis: cash and more specifically the U.S. dollar.
- In 2008, the dollar strengthened about 22% against the Euro as enterprises, especially in the world's largest economy, hoarded the U.S. currency.
- Since the start of the month, overseas investors have dumped Indian equities and debt on a scale not seen since the taper tantrum of 2013, when news that the U.S. was going to gradually wind down its GFC-triggered quantitative easing spurred an exodus out of emerging market assets.
- As on March 20, foreign institutional investors (FIIs) had sold a net ₹95,485 crore, or more than \$12 billion, of shares and bonds.
- This outflow has coincided with the sharp fall in the equity market's key gauge, the 30-stock S&P BSE Sensex, which has slumped 22% so far in March.
- The rupee's decline in March has been part of a broad trend as most currencies across the globe have weakened against their U.S. counterpart.
- The dollar index, which gauges the greenback's strength against a basket of six currencies, has gained almost 4% so far this month.

- The risk aversion as a result of the pandemic triggered by the global outbreak of COVID-19 has been so intense that it has not spared most perceived safe havens including U.S. Treasuries (government bonds) and significantly even gold.
- The yellow metal too has been sold by investors looking to hold the most liquid and most fungible of all assets — the U.S. dollar.

Measures needed to strengthen the rupee:

- The RBI can **start supplying dollars** in the market to cool down the exchange rate.
- **Talk the market down:** In the current situation there is a tendency for importers to rush in to buy dollars and exporters to hold back remitting their earnings on the expectation that the rupee will depreciate further. This exacerbates the demand-supply matrix for foreign currency and drives down the rupee further.
- The RBI can ensure that export earnings come back to the country on time while importers should be urged not to rush in to buy dollars in advance.
- The government should focus on exports and to the extent possible, especially on the tax credit/refund part, clear the coast for exporters. SMEs (small and medium enterprises) which are dominant in the export market have had tax refund issues and this needs to be sorted out.
- As oil is the major import component, and whose prices are rising, a separate window needs to be opened for selling dollars.
- Hedging processes must be put in place to ensure that the purchases are in order.
- OMCs (oil marketing companies) do take forward contracts to buffer against price changes, but to the extent there are open positions hedging should be made mandatory.
- the RBI would have to monitor the other components of demand for dollars — like it did previously, which was five years back — to ensure that there are limits to the drawal of dollars for other purposes such as travel, investment, and education.
- the channels for external commercial borrowing should be looked at judiciously. While urging companies to explore the market makes sense, it should be noted that un-hedged positions can put on pressure on debt servicing.
- the channel for considering a sovereign bond or any such scheme for getting expatriates to invest in such bonds should be planned in advance — which may not be required if conditions stabilise.
- the capital flows need to be monitored proactively and this is where FPIs (foreign portfolio investments) matter. The strong inflow of FPIs has the power to rein in the rupee.
- More zing for masala bonds: Removal of restrictions on Indian banks' market making in masala bond, including the restriction on underwriting such bonds.
- Steps to cut non-essential imports and increase exports. These include steps to curb the import of non-essential goods and encourage the export of domestic goods, which will help in addressing the current account deficit.
- India still has plenty of measures left to curb like issuing NRI bonds and raising interest rates, if things don't improve then the government can resort to other strict measures to curb rupee slide.

Conclusion:

India still has plenty of measures left to curb like issuing NRI bonds and raising interest rates, if things don't improve then the government can resort to other strict measures to curb rupee slide. The government needs to think of a long-term plan to boost exports, through steps that remove

policy barriers that are impeding the growth of export-oriented sectors (like Textiles, petrochemicals, auto-ancillaries etc).

In view of the emergency situation, FRBM Act can be relaxed by the Government of India to enhance the fiscal stimulus. Do you agree? Discuss. (250 words)

Reference: [Financial Express](#)

Why this question:

The question is amidst the pandemic covid19 and its impact on Indian economy.

Key demand of the question:

One must discuss the need of relaxing the FRBM Act and to what extent such an act is justified.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain the context of the question.

Body:

Fiscal Responsibility and Budgetary Management Act (2003) limits the government borrowings for maintaining Macroeconomic stability.

Discuss the Necessity for the relaxation of provisions of FRBM Act.

Due to Covid-19 pandemic the supply chain is largely effected which may lead to job cut of many employees, results in vicious cycle of Poverty.

Discuss the points to be considered for designing a fiscal package.

Conclusion:

Conclude with positive implications of relaxing the FRBM Act.

Introduction:

The Fiscal Responsibility and Budget Management (FRBM) Act was enacted in 2003 which set targets for the government to reduce fiscal deficits. Looming threats of global recession, melting financial markets, and an impending domestic demand destruction pose difficult questions about possible policy responses in India. There is no doubt that till now, the policy focus has been to avert the health emergency caused by COVID-19 because otherwise, the economic emergency would be inevitable.

Body:

Challenges in easing the fiscal deficit target:

- The government has already utilized the elbow room offered by the FRBM Act under exceptional circumstances in the FY20 and FY21 budgets, with the targeted budget deficits being 0.5% of GDP higher than the FRBM mandated ones.
- This leaves limited conventional fiscal space for any stimulus, but there could be a case for temporarily suspending the FRBM Act, as was done during the global financial crisis of 2008.
- In fact, given the recent trends, the FRBM Act-mandated maximum target of a fiscal deficit of 3.8% of GDP might have already been breached for FY20.

Reasons for need of a fiscal stimulus:

- With further fall in the tax collection by the Central Government, the devolution of funds to states by the Centre would also suffer.
- In view of the lockdowns, there could be little doubt that the GST collection, which constituted 70 per cent of the state's tax collection, would plummet this year.
- The "lockdowns" and closure of businesses announced by various states to arrest the spread of Covid would severely restrict the capacity of states to mobilise resources.
- However, considering the grave situation, fiscal stimulus should not be deterred by FRBM considerations as now, growth concerns outweigh worries about future macro stability risks.
- The states have urged Prime Minister to allow states to borrow more by raising the limit set under the Fiscal Responsibility and Budget Management (FRBM) Act.

Measures needed for fiscal stimulus:

- Earmarking an enhanced budget for healthcare would definitely be the top priority.
- Income support to people whose livelihood has been impacted (these will primarily include daily wage earners in different industries, and services like construction, travel, etc). Direct cash transfer to this group is ideal, but might suffer from proper identification challenges.
- Packages for deeply affected sectors like travel and tourism (9.2% of India's GDP) and MSMEs could have three components—temporary postponement of taxes, cheaper loans, and explicit financial grants.
- Frontloading public spending to counterbalance near-term headwinds
- The government can also consider temporary suspension of long-term capital gains tax to incentivize flows back into the equity market in the short term.
- Funding a fiscal package: Even if the government limits the fiscal stimulus to 0.5% of GDP for FY21, there is likely to be a revenue slippage of 0.8% of GDP each from both tax, and non-tax revenue components in the current environment, making the overall fiscal requirement higher by more than 2% of GDP.
- The monetary response: Central bankers are trying to counter the two channels of transmission of the virus shock—financial stability risk arising out of large market dislocations, and growth risk from estimated disruption in economic activity.

Conclusion:

An early assessment and acknowledgement of the extent of demand destruction (both global and domestic) is the need of the hour. Faced with significant uncertainty over the depth and duration of the negative shock, policymaking should be extremely quick and innovative. The fiscal package should, ideally, be proactive (not waiting for signs of growth slowdown in high frequency data), quickly implementable (for a change, revenue expenditure should get priority over capital expenditure), sizeable (at least 0.5% of GDP), targeted (urban might need more support than rural in initial stages), and reversible.

What could be the economic challenges posed by the COVID-19 pandemic to India?

Discuss what should be the focus areas and necessary actions for an economic recovery package for India and discuss the challenges associated with it. (250 words)

Reference: [Economic Times](#), [The Hindu](#)

Why this question:

The question examines the economic impact of the COVID-19 outbreak.

Key demand of the question:

The article explains the economic impact of the COVID-19 pandemic.

Directive:

Telegram: <https://t.me/insightsIAStips>

Youtube: <https://www.youtube.com/channel/UCpocbcX9GEIwaile4HLjwA>

Facebook: <https://www.facebook.com/insightsonindia>

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain the economic challenges posed by the COVID-19 on the world.

Body:

Pandemics, apart from posing major health risks, also pose economic and social risks. Pandemics have the potential to disrupt economies, and destabilize national security.

The effect of the strong clampdown measures taken by the various governments to arrest the spread of the coronavirus is being felt across the global economy.

The shutting down of industries may lead to loss of jobs and subsequently demand in the economy.

There are fears of a global recession given that the two largest economies of the world, China and the U.S. have been affected by the pandemic. The large and developed economies are expected to not merely slow down, but to contract and experience negative growth.

Present the case of India.

Conclusion:

Conclude with what should be the way forward.

Introduction:

Pandemics, apart from posing major health risks, also pose economic and social risks. Pandemics have the potential to disrupt economies, and destabilize national security. The effect of the strong clampdown measures taken by the various governments to arrest the spread of the coronavirus is being felt across the global economy. India recently set up a task force under the Finance Minister to assess the economic impact of the pandemic and suggest economic recovery measures.

Body:

Economic challenges posed by COVID-19 pandemic to India:

- **Job losses:**

- There are reports that a third of all restaurants could shut down in the formal sector alone and shed more than 20 lakh jobs, in the coming months.
- The automotive sector which was already hit by slowing demand is shutting down its factories due to the pandemic. This puts at risk the incomes of around a million people employed in the automotive sector.
- The unorganized sector, which constitutes a large proportion of the working population in India, would be the most affected, given the loss of livelihood opportunities and lack of social security measures.

- **Drop in demand:**

- Job losses lead to lesser disposable income in the hands of the people and subsequently, consumption drops and overall demand collapses.

- **Financial sector crisis:**

- When businesses close down, they default on their commercial obligations to their financiers and suppliers. This freezes up credit flow in the economy and also affects related sectors.
- **Effect on trade:**
 - Trade constitutes a considerable proportion of the Indian economy. The reduced trade due to stringent clampdown measures would affect the growth in the Indian economy.
 - Given the global nature of the crisis, it is not even possible for India to import and export its way to recovery.

Focus areas and necessary actions for an economic recovery package for India:

- **Safety net for the most affected sections:**
 - About 37% of households depend on casual labour as their major source of income for rural and urban India, and nearly 55% have tenuous regular employment, as per the Periodic Labour Force Survey data for 2017-18.
 - The poor will be the worst affected, including informal workers, workers in the gig economy, or those running small businesses for whom social safety nets are not adequately in place.
- **Direct cash transfer:**
 - As part of the efforts to provide a safety net for the most affected sections, direct cash transfer option should be considered.
 - The destruction of jobs, incomes and consumption can be addressed through a direct cash transfer of 3,000 a month, for six months. This should be provided exclusively to the most vulnerable section of the society.
 - Considering only the bottom half of all Indian households, the direct cash transfer would cost nearly 2.2-lakh crore and reach 60 crore beneficiaries, covering agricultural labourers, farmers, daily wage earners, informal sector workers and others.
 - This would ensure a sustained income stream for the millions who have lost their incomes and provide them a safety net and a sense of confidence.
 - Various existing schemes of the government can be subsumed under the direct cash transfer scheme, to ensure sufficient financial resources to execute the direct cash transfers.
 - The Pradhan Mantri Kisan Samman Nidhi (PM KISAN) programme with a budget of ₹75,000 crore can be subsumed into the direct cash transfer scheme.
- **Right to work:**
 - The Mahatma Gandhi National Rural Employment Guarantee Act (MGNREGA) must be expanded and restructured into a public works programme, to build much-needed hospitals, clinics, rural roads and other infrastructure. This can be achieved by integrating MGNREGA with the Pradhan Mantri Gram Sadak Yojana and the roads and bridges programme.

- The above three programmes together have a budget of nearly ₹1.5 lakh crore. This must be doubled to ₹3 lakh crore and serve as a true 'Right to Work' scheme for every Indian who needs it.
- **Access to food:**
 - The Food Corporation of India has sufficient buffers of rice, wheat and unmilled paddy stocks.
 - The buffer stocks should be used to provide 10kg rice and wheat to every Indian family, free of cost, through the Public Distribution System.
 - The combination, of a basic income of 3,000 rupees a month, a right to work and food grains, will provide a secure safety net for the most vulnerable section of the population.

Challenges associated with economic recovery package:

- There is a need for addressing the liquidity squeeze in the financial system
- Service sectors like airlines, tourism, hospitality, entertainment and logistics have been disrupted due to the clampdown in place.
- India's exports predominantly in textiles and leather which are labour intensive sectors have been disrupted due to the sudden drop in global demand and the restrictions on trade.

Conclusion:

India needs an immediate relief package of 5-lakh crore to 6-lakh crore rupees, targeted across all sections of society and sectors of the economy. Given the inevitable economic crisis, it is prudent to take necessary actions immediately. India needs a comprehensive recovery package that will first cushion the economic shock and then help the economy recover.

Government Budgeting. Investment models.

What do you understand by Budget Transparency? Discuss the advantages associated as well as the ways through which it can be promoted in working of a government. (250 words)

Reference: [Times Of India](https://timesofindia.com)

Why this question:

The question is based on the concept of 'Budget transparency' and the advantages it carries in the effective functioning of the government.

Key demand of the question:

The answer must discuss the concept of 'Budget transparency' and its utility to the government in detail.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly define the what 'Budget transparency' is.

Body:

Budget transparency refers to the extent and ease with which citizens can access information about and provide feedback on government revenues, allocations, and expenditures. Explain the

importance of the concept; Budgets are key documents since they lay out a government's priorities in terms of policies and programs. Opening up budgets and democratizing the budget process gives citizens a say in policy formulation and resource allocation. Highlight the pros and cons associated in implementing the concept. Elaborate on its effect on the functioning of the government. Explain the ways through which budget transparency can be promoted.

Conclusion:

Conclude that budget transparency, while not a goal in itself, is a prerequisite for public participation and accountability. Such information must be disseminated in a timely manner so that citizens can effectively provide feedback that can influence policy formulation and resource reallocation.

Introduction:

Public confidence in the elected representatives/institutions is the foundation of democracy. However, this confidence is undermined by the poor quality of services and non-fulfillment of electoral mandates by the elected representatives. One of the ways in which accountability and transparency in governance can be enhanced by providing ordinary citizens access to information about how public resources are allocated and used by the government. This is the very essence of budget and fiscal transparency.

Body:

Recently, five economic experts from different institutes on Monday flayed the Union budget for "being least transparent" and not acknowledging the economic problem that the country faced.

Advantages associated with Budget transparency:

- Understanding the structure and functioning of finances will enable citizens to hold public functionaries accountable.
- Transparency in budgetary process is essential because it will lead to an improvement in delivery of public services such as education, health etc. at both the union and state levels.
- Budget transparency will enhance public confidence in the government and will act as a deterrent to financial mismanagement and corrupt practices in the country.
- Accountability of the executive will improve if citizens are empowered to access budget information.
- Corruption and financial mismanagement will be tackled efficiently if budgetary decisions are open to analysis and public scrutiny.
- Budget transparency will lead to equitable distribution of public resources.
- Citizens, Civil society organizations, NGOs and different professional groups will get a chance to contribute to budgeting processes as well as policy-making.
- Microeconomic and fiscal stability can be enhanced as the strengths and weaknesses of the budget will be identified in advance.
- Increasing transparency will ensure that investor confidence also increases which in turn will have a good impact on the economy of the country.

Effective and easiest ways to enhance budget and fiscal transparency:

- Clearly defining the roles and responsibilities of different officials/departments involved in the budgetary process.
- Budget literacy/awareness should be enhanced among not only the legislators but also the ordinary citizens.

- Ensuring that useful, comprehensive and reliable budget information is made available to the public.
- Civil society organizations, NGOs and ordinary citizens should be given opportunities to share their perspectives on budget.
- Checks and balance system should be established to assess the budgetary process.

Conclusion:

Budget transparency is of utmost significance so that the public are satisfied that there is guarantee of financial order and the government is working according to its obligations. Incorporating budget and fiscal transparency through efficient governance reforms is absolutely necessary.

Discuss what are electronic transmissions in global trade? Do you think negative list approach on custom duties on them is a better substitute in protecting the competitiveness? Analyse. (250 words)

Reference: [Financial Express](#)

Why this question:

The debate about whether or not to extend the WTO Moratorium on imposing customs duties on electronic transmissions has, to date, narrowly focused on its potential customs revenue implications. Thus the question aims to analyse the approach of the negative list method on custom duties.

Key demand of the question:

The answer must discuss the electronic transmissions in global trade, and the aspects of methods to protect them from competitiveness.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain what electronic transmissions are in global trade.

Body:

Explain the premise first – that import barriers protect domestic industries from foreign competition, and allow them to grow. A similar thought informs India's position against a moratorium on customs duties on electronic transmissions at the World Trade Organization (WTO). Present points for and against the negative list approach on custom duties of these electronic transmissions. Take cues from the article and form an opinion.

Conclusion:

Conclude with what should be the way ahead.

Introduction

Digitizable products are those products that are traded both in physical form as well as 'online' i.e. downloaded from internet. For instance, music, e-book, software etc. The online trade of digitizable products is termed as electronic transmissions. Trade in ET differs from cross-border e-commerce as it excludes those products which are ordered online but delivered physically.

With the advent of Industry 4.0 and the associated technological advancements, the scope of digital trade is expanding much faster than what anyone could have imagined two decades ago. Growing digital trade has been accompanied by a rapidly growing trade in electronic transmissions (ET).

Background of the issue

- In 1998, on the basis of a proposal submitted by the United States, WTO members adopted a Declaration on global electronic commerce, which included a two-year moratorium stating that “Members will continue their current practice of not imposing customs duties on electronic transmissions”.
- Since 1998, this Moratorium has been renewed every two years (except for 2003-2005 when the members failed to reach a decision in Cancun).
- However, because of the difficulties in limiting the scope of ET, the debate on the Moratorium on custom duties has continued without reaching any consensus. Even after twenty years of discussions in the WTO, the understanding of the scope and definition of ET remains limited and the questions that were raised in 1999 remain the same in 2018.
- Among other issues, three important issues which have been continuously debated are:
 - characterization of ET as goods, services, or IP?
 - revenue implications of the Moratorium; and
 - technological feasibility of levying custom duties on ET.

India's stance

- India agreed not to impose customs duties on electronic transmissions in 1998, under WTO's Work Program on e-commerce. This means no duties are applied to products and services transferred electronically. Such multilateralism is designed for flexibility, and the moratorium is reversible.
- If turned into law, moratorium may become irreversible, reducing India's ability to apply an industrial policy lens to the digital economy.
- India had argued that the ecommerce moratorium led to loss of revenue as it gave such transmissions immunity from taxation in the WTO.
- As per an UNCTAD study, India's potential loss of revenue by not taxing electronic transmissions is around \$500 million every year.

Negative List Approach

A negative-list approach, allows flexibility to identify specific products and services not covered by the moratorium.

Advantages for India

- **Services Sector:** India's service industry prospers in an open trade environment, but stagnate in a closed one—90% of the revenue of open IT and IT-enabled industries comes from global markets.
- **Fintech:** India is also a net importer of banking and financial services—industries protected from foreign competition. Their lack of global competitiveness translates to poor domestic performance.
- **OECD** has rebutted the UNCTAD study comprehensively. Infact, it estimates that India will lose 49 times more in terms of GDP, and 51 times more in terms of tax revenues, than what it will gain from tariffs.
- **Increase in digital trade:** India accounts for only around 2% of global trade in value added terms, and digital markets can help increase this.
- **Cheaper Electronic Import:** Digital imports don't necessarily reduce the need for physical imports, rapid digitalization can cause an increase in physical imports of electronic equipment. India's electronics imports will overshadow oil imports within the next decade.

- **Champion Sectors:** The government's Champion Sector initiative, which promotes exports of competitive services like media and entertainment, recognizes this opportunity. Such areas of strength must not be sacrificed at the altar of protectionism.

Disadvantages

- **Revenue Losses:** It is found that the potential per annum tariff revenue loss following a Moratorium will be much more for developing countries as compared to the developed countries, which have very low bound custom duties on the digitizable products.
- **Policy Space:** Broader implications of the Moratorium on developing countries are in terms of losing policy space to develop their digital capabilities as well as their software sectors, which can have important implications for their manufacturing and industrialization processes.
- **No level playing field:** With placing moratorium on duties on ET, developing nations like India will lose level playing field with developed nations to protect their domestic producers as well as protect their infant digital services providers.

Conclusion

Discussions on negative list approach must be done in the upcoming ministerial conference at Nur Sultan, Kazakhstan. This will balance the needs of developing and developed nations. Any further decisions on Moratorium on custom duties on ET therefore need to be taken with caution and clarity about the scope of the Moratorium and categorization of 'digital content'. While GATT gives developing countries the flexibility of imposing custom duties on digital content and maintaining with their negotiated tariffs, GATS can provide them the flexibility of regulating trade in ET according to their domestic laws and regulations. Irrespective of the categorization, it is imperative for developing countries to have policy instruments controlling the trade in ET.

Major crops cropping patterns in various parts of the country, different types of irrigation and irrigation systems storage, transport and marketing of agricultural produce and issues and related constraints; e-technology in the aid of farmers Discuss the probable concerns associated with the new policy that aims to lend legal recognition to shifting cultivation as a form of agroforestry also suggest a way forward. (250 words)

Reference: [Business Standard](#)

Why this question:

The government is reported to be formulating a new policy that would lend legal recognition to shifting cultivation as a form of agroforestry to enable nomadic farmers get bank credit and agriculture-related subsidies.

Key demand of the question:

The answer must present the probable concerns associated with the new policy that aims to lend legal recognition to shifting cultivation as a form of agroforestry while suggesting a way forward.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define what constitutes shifting cultivation.

**Body:**

Have the following aspects explained –

What is Shifting Agriculture? – It involves clearing of forests, burning the stubble and cultivating the land for a few years before moving to another plot, leaving the old patch for regeneration.

Discuss what was NITI Aayog's idea? – The NITI Aayog which had mooted the idea of redefining jhumming land-use as agro-forestry in a 2018 report.

Discuss the concerns associated.

Explain what should be done.

Conclusion:

Conclude with way forward.

Introduction:

Shifting cultivation or jhumming is a widely practiced system of crop cultivation among the indigenous communities of India. The practice, also known as slash-and-burn agriculture, is when farmers clear land by slashing vegetation and burning forests and woodlands to create clear land for agricultural purposes. This provides very easy and very fast method of the preparation of the land for the agriculture. The bush and the weeds can be removed easily. The burning of waste materials provides needed nutrients for the cultivation. It gives a family its food, fodder, fuel, livelihood and is closely linked to their identity.

The government is reported to be formulating a new policy that would lend legal recognition to shifting cultivation as a form of agroforestry to enable nomadic farmers get bank credit and agriculture-related subsidies.

Body:

The **National Institution for Transforming India (NITI) Aayog**, which had mooted the idea of **redefining jhumming land-use as agroforestry in a report in 2018**, has its own logic for doing so. It is based on the contention that shifting farming is essentially a method of putting land to two distinct uses alternately — agriculture, when it is under cultivation, and fallow forestry, when it is left untilled for revival of forest.

While the objective of this move is good, as it is unfair to deny government sops to those engaged in this age-old farm practice, its consequences are likely to be disastrous.

Challenges posed by shifting cultivation:

- This mode of farming, once fairly common in many parts of the world, has gradually given way to settled agriculture to stave off its ill-effects on ecology, biodiversity, habitats and other natural features.
- It also causes loss or deterioration of forest cover leading to soil erosion and degradation of catchments of rivers and other water bodies.
- There can be the heavy erosion of the soil is getting affected and by this, the revers that are in the plain and low lying areas like the Brahmaputra and Barak get flooded in the time of the heavy rainfall.
- By shifting cultivation, there is a loss of 22 percent of the soil that is on the top of the soil and full of fertility. This creates a serious problem in the economic rate of peoples. In this, there is the rendered permanent land in the shifting cultivation.
- In India, this pernicious practice is still in vogue on an estimated 1.73 million hectares, largely in the ecologically fragile hilly terrains in the Northeast. The other states where this primitive

system of agriculture still persists in some pockets are Odisha, Andhra Pradesh, Kerala and Madhya Pradesh.

Concerns associated with the new policy:

▪ **Increasing pressure on land resources:**

- with growing population pressure on land, the time given for renewal of forests — just three to four years — is usually insufficient for that purpose.
- This phase used to be as long as 10 to 40 years in the past. The green cover now rarely comes up to the level where it can be deemed as secondary forest.

▪ **Poorly maintained land records:**

- There is a lack of updated and authentic data on the area under shifting cultivation as well as the total number of households practicing shifting cultivation.
- While different programmes designed to address the management of shifting cultivation have claimed drastic reductions, the Forest Survey of India's (FSI, 2015) reports over the years continue to attribute large scale deforestation and loss of forest cover in NE India to shifting cultivation.

▪ **Inaccessibility of credit:**

- The farmers engaged in jhumming wanted opportunities for higher income from farming and non-farm employment, education and medical facilities and other civic amenities apart from access to government schemes, which they are unduly denied in the absence of land titles (pattas) in their name.
- They also do not get many of the benefits provided under the Forest Rights Act. At present, they are treated neither as farmers nor as forest dwellers.

▪ **Plight of the farmers:**

- The farmers engaged in jhumming (jhumias) are themselves fed up with this kind of nomadic life. They want to move beyond subsistence farming to take up market-linked agriculture.
- A recent study conducted by the Mizoram University's School of Earth Sciences bears this out. As many as 95 per cent of the respondents felt that jhumming was economically unviable.

Way forward:

- A viable policy to curb shifting agriculture, is that if financial assistance is made available for terracing the hill slopes where jhumming is practised now, the jhumias would gladly shift to permanent farming.
- This, indeed, is not a tall order and should be complied with to put an end to the socio-ecological curse that shifting farming has virtually turned into.
- State agencies like agricultural marketing, forest development corporations of concerned states should take steps to formalize, promote and organize marketing of products from shifting cultivation.

- There is an urgent need to update data on the area under shifting cultivation as well as the total population still involved with the practice.
- There is need to blend traditional knowledge on resource use and management with modern scientific approaches.
- Managing transformations in shifting cultivation areas is fundamental to agricultural development in the uplands of northeast (NE) India and an important element of the Act East Policy.

What India is at present facing is not a “supply”, but a “supply chain” problem in its agriculture sector. Analyse the statement amidst hurdles for free movement and trade in agricultural produce owing to lockdown.(250 words)

Reference: [Indian Express](#)

Why this question:

The Author explains that amid lockdown, hurdles for free movement and trade in agricultural produce must be cleared immediately.

Key demand of the question:

One should explain the issue the agriculture sector facing in the country and what needs to be done to save the sector amidst the ill-effects of the lockdown to it.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Briefly highlight the ongoing problems in the agriculture sector.

Body:

To start with, explain first the effect of the lockdown on the agriculture system of the country.

Explain – What India is at present facing is not a “supply”, but a “supply chain” problem, list down the causative factors first – inter-state movement restrictions and arbitrary actions by local authorities to enforce the lockdown etc.

Take hints from the article and explain what needs to be done.

Conclusion:

Conclude with way forward.

Introduction:

The Food Corporation of India’s current wheat and rice stocks are over 3.5 times the required normative buffer reserve. Government godowns are also overflowing with surplus stocks of pulses. However, the situation today, arising from the nationwide lockdown to combat the novel coronavirus has led to the breakdown of supply chain posing a big problem in agricultural sector. This would result in food quality issues, huge wastage of food, reduced remuneration to farmers and agrarian distress.

Body:

Hurdles for free movement and trade in agri produce due to lockdown:

- The supplies are plentiful but the shutting down of hotels, restaurants and catering businesses has led to demand destruction from institutional buyers.
- With abundant availability and demand now largely restricted to direct household consumption, there could be scope for panic buying and hoarding and people going without food.

- Inter-state movement restrictions and arbitrary actions by local authorities to enforce the lockdown — including closing down produce collection centres and warehouses of organized retailers.
- The links in the chain connecting farmers to consumers have broken down, in turn opening up arbitrage opportunities for unscrupulous speculators
- Agriculture is a 'state subject' and a large part of investment as well as regulatory progress is happening at the state level. The lack of coordination between the states at this time of crisis would be a debacle.
- **Limited reach of mandis:** Also, this procurement system has failed to cover the entire country evenly (back of the envelope calculation suggests that on an average, a farmer needs to travel 12 kms to reach the nearest mandi and more than 50 kms in NE India) while according to the recommendations by National Farmers Commission, availability of markets should be within a 5 km radius.
- **Inadequate infrastructure for storage:** The Planning Commission has recently estimated the gap between agri-warehousing supply and demand at 35 mn MT.
- **Lack of cold storage infrastructure:** India's current cold storage capacity at 25 MT is barely sufficient for 10% of fruit and vegetables produced in the country.

Solutions to ease the supply-chain:

- The only way to prevent this is to ensure seamless flow of produce.
- The trucks should not be held up at state borders due to inter-state movement restrictions.
- The lockdown guidelines have clearly defined food among the essential goods whose transport and supply are not to be subjected to any hindrances.
- The prime minister's message of free flow of goods should be percolated to the ground.
- The state food and civil supplies departments must ultimately ensure that the wholesale markets in these cities receive enough produce to feed their consumers.
- **Integrated cold chain solutions:** They could provide customized solutions for cold storage and refrigerated transportation across India for fresh and frozen commodities.
- **Comprehensive agriculture logistics solutions:** Private players that provide integrated post-harvest management solutions have entered the space to fill these gaps. They could also provide collateral management and other value added services (quality testing, agri insurance, bulk procurement and rural retailing) to its clients.
- **Alternate marketplaces:** By providing a way to bypass the long chain of intermediaries by directly connecting buyers and sellers of agricultural produce and allied services, via a web and mobile based information exchange platform.
- **Reducing the information asymmetry:** Riding on the high mobile penetration in rural India private players are working on the problem of information asymmetry for agricultural producers, by making personalized agricultural market information available to the farmers at minimal costs, through a mobile based service.
- **Innovative ICT tools for supply chain management:** A hosted web service for supply chain management, which can be accessed via basic mobile phones and web browsers, which makes it uniquely suitable for in rural markets. It is a configurable service which offers customers the ability to capture and share data in a simple, low-cost way, empowering them to make better logistics decisions.

Conclusion:

These solutions could lead to better supply chain management in Indian agriculture, reducing inefficiencies and increasing farmer realizations, as well as curbing food waste. A coordinated effort at this time of crisis with good policies bolstered by logistics of the private players can help in achieving the goal. Well-functioning markets are the best guarantee against any collapse of exchange entitlements in the ongoing battle against COVID-19.

Infrastructure: Energy, Ports, Roads, Airports, Railways etc.

Despite attempts by the government to cut imports of coal, there has been year on year growth in shipments of the fuel. Discuss the causes and measures needed to switch to renewables in light of India's INDC goals. (250 words)

Reference : [The Hindu](#)

Why this question:

India's thermal coal imports rose 12.6% to nearly 200 million tonnes in 2019, government data reviewed by Reuters showed, reflecting the second straight year of growth in shipments of the fuel despite attempts by the government to cut imports.

Key demand of the question

The question expects us to explain why there has been an increase in the coal imports in India. Further analyse the impacts of increased coal usage on environment. Conclude the answer with measures needed to switch to the Renewable sources of energy in line with India's INDC goals.

Directive word

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer

Introduction

Give a brief overview of India's coal usage scenario.

Body

Explain how important is coal for increasing energy needs of India.

Discuss the various reasons for increased import of coal resources.

Discuss the various implications of increased coal usage on environment and climate change.

Finally, talk about the measures needed to switch to Renewable sources of energy

Conclusion

Conclude with a way forward.

Introduction

Coal accounts for around 70% of the country's power generation. India's thermal coal imports, rose 12.6% to nearly 200 million tons in 2019, as per government data reviewed by Reuters showed, reflecting the second straight year of growth in shipments of the fuel.

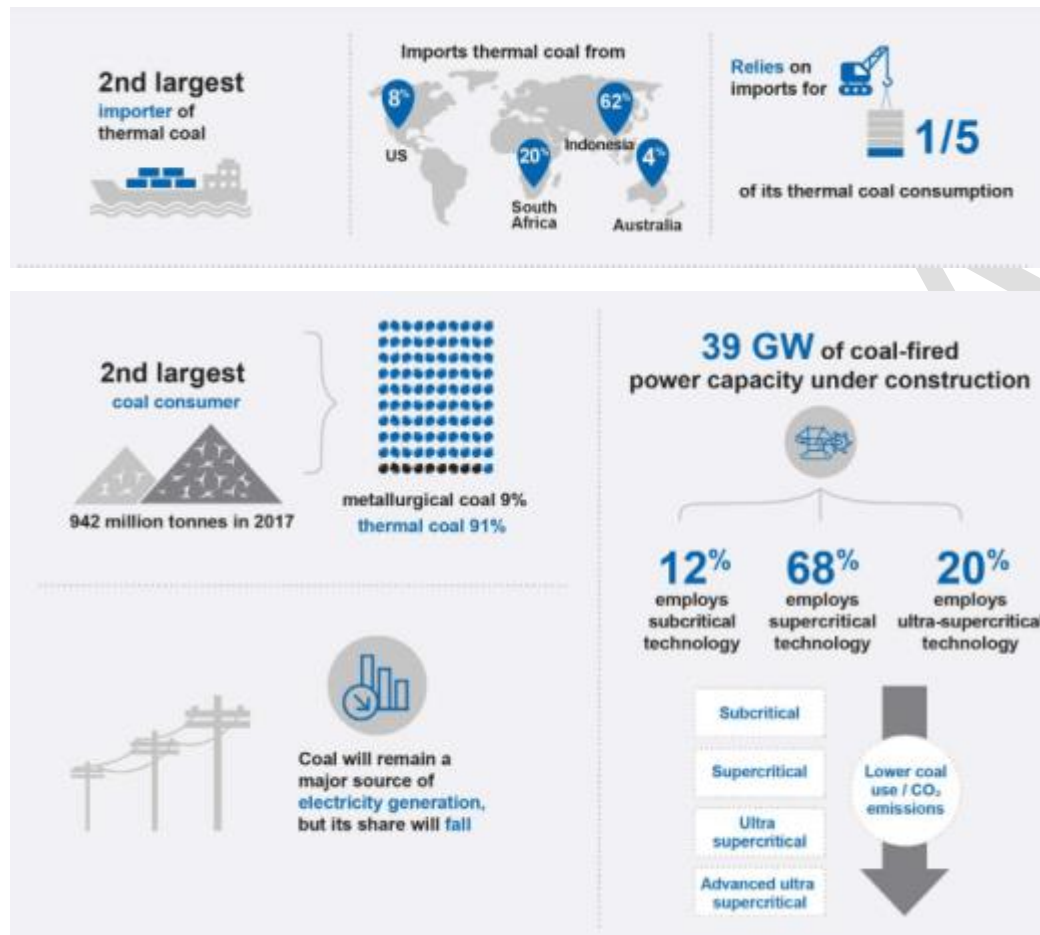

This, combined with the growth of coal-consuming industrial sectors like steel, is why the solid fuel source will continue to be integral to India's economy in the next couple of decades. This is despite the government's ambitious plans to increase the generation of renewable energy to 175GW by 2022.

Body

Coal Usage: Status

- Coal still provides half of India's commercial primary energy and is the dominant fuel for power generation.
- India is the world's second largest importer of thermal coal, and has the potential to be an ongoing source of demand growth.
- Coal India has ambitions to raise domestic coal production to 1 billion tons by 2025–26.

Why switch to renewables?

- **Coal is a Dirty Fuel:** It is a major source of water pollution. Drainage from mining sites, sediment runoff from mining site, erosion from overburden dumps and spoils heaps, leaking from tailing pond heated and heavy metals loaded effluents from coal industries and sewage effluents have environmental impact.
- Blasting and drilling operations, coal fires, vehicular traffic, heavy trucks plying on haul roads, loading and unloading of coal, wind erosion from overburden dumps are air polluting sources.
- Open Case Mining and underground mining changes the vegetation pattern.
- Changes in topography can occur due to clearing of land for opencast mining, erecting infrastructure related to underground mining, dumping of solid wastes in nearby areas, subsidence due to fires.
 - Subsidence may lead to loss of infrastructure and may also lead to a change in the natural drainage pattern of the area.

- Several occupational hazards are associated with coal mining: Pneumoconiosis (by inhaling coal dust), allergies and asthma, noise hazard etc.

Measures to switch to renewables

India has committed to achieve 40 % of India's power capacity to be based on non-fossil fuel sources, by 2030 under the nationally determined contributions. Following measures are being taken:-

▪ Policy Measures

- Government is facilitating developers by allowing Foreign Direct Investment (FDI) of up to 100% through the automatic route.
- Moreover, Inter State Transmission System (ISTS) charges and losses for inter-state sale of solar and wind power shall also be waived for renewable projects commissioned by December 2022.
- The National Wind-Solar Hybrid Policy was issued in May 2018. The main objective of the policy is to provide a framework for promotion of large grid connected wind-solar PV hybrid system for optimal and efficient utilization of wind and solar resources, transmission infrastructure and land.

▪ Solar energy

- Programs such as PM-KUSUM, solar rooftop phase II, 12,000 MW CPSU scheme Phase II, have been introduced in the recent past to increase the share of solar energy usage.
- Solar projects of aggregate capacity **4195 MW have been commissioned** inside various solar parks. Total of **47 solar parks** of aggregate capacity 26,694 MW has been approved in 21 States up to November, 2018.

▪ Wind Energy

- The country currently has the fourth highest wind installed capacity in the world with total installed capacity of 34.98 GW as on October, 2018 against a target of 60 GW by 2022.
- Further, around 9.4 GW capacity is under implementation or have been tendered out.
- The recent assessment conducted by National Institute of Wind Energy (NIWE) indicates a gross wind power potential of 302 GW in the country at 100 meter above ground level.

▪ Small-Hydro power

- A total capacity of 4.5 GW of grid connected small hydro power has been installed in the country as on October 2018 against a target of 5 GW small hydro power by 2022.
- Further, 126 projects of capacity 0.73 GW are under various stages of implementation.

- **Off-grid Renewables :** There is a need for implementing off grid and Decentralized renewables program for meeting energy demand for cooking, lighting, motive power, space heating, hot water generation among others.

Conclusion

India's energy policy currently focuses on bringing affordable electricity to all homes. India's per-capita electricity consumption is only one-third of the world average, and millions of homes still lack an electricity connection. The environment is equally important while climate change mitigation is the primary concern. Despite growing coal consumption, India is on track to meet its Nationally Determined Contribution under the Paris Agreement.

Science and Technology- developments and their applications and effects in everyday life; Achievements of Indians in science & technology; indigenization of technology and developing new technology.

Discuss the need for in- flight Wi-Fi and the benefits and concerns associated.(250 words)

Reference: [Economic Times](#)

Why this question:

The Union Government has permitted airlines operating in India to provide in-flight WiFi services to passengers thus the question.

Key demand of the question:

The answer must discuss the need for in- flight Wi-Fi and the benefits and concerns associated.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain that the Telecom Commission had given its permission to in-flight connectivity of Internet and mobile communications on aircraft in Indian airspace in 2018.

Body:

Explain what you understand by In-flight connectivity of internet Technology. Discuss the technology; its technicalities in short. By this the pilot of an aircraft may permit the access of Internet services by passengers on board an aircraft in flight, through Wi-Fi on board, when laptop, smartphone, tablet, smartwatch, e-reader or a point of sale device is used in flight mode or airplane mode. Broadly, in-flight connectivity systems use two kinds of technologies; discuss them. List down the advantages, challenges and concerns involved.

Conclusion:

Conclude with benefits.

Introduction:

In-flight Wi-Fi connectivity essentially allows those onboard aircraft to access voice, video and data services after the aircraft has attained an altitude of 3,000 meters. The government has permitted airlines operating in India to provide in-flight Wi-Fi services to passengers. Previously, the Telecom Commission had given its green signal to in-flight connectivity of Internet and mobile communications on aircraft in Indian airspace in 2018.

Body:

Working of in- flight connectivity:

- In-flight connectivity systems use two kinds of technologies– **terrestrial and satellite internet services**.
- Once flight mode is activated, the plane's antenna will link to terrestrial Internet services provided by telecom service providers.
- Then, when the aircraft has climbed to 3,000 m, the antenna will switch to satellite-based services.
- This way, there will be no break in Internet services to passengers, and cross-interference between terrestrial and satellite networks will be avoided.

Need for in-flight connectivity:

- The on-board access technology, when combined with AMSS, allows passengers to have telecom connectivity.
- The on-board access technology can be Wi-Fi to access internet, e-mail, internal corporate networks, etc. onboard aircraft.
- The access technology can also be mobile network which will allow voice and text communications.
- Internationally, internet services onboard are provided by all the IFC service providers. However, there is a demand for Mobile Communication on Aircraft (MCA) services also.

Benefits:

- It would enable flyers to avail data and voice services during flights over Indian airspace.
- Airlines will now be equipped to bring dramatic, yet cost effective, enhancements to the passenger experience –with passengers ordering products from their phones and tablets and arranging to have them delivered to their homes, or the hotel on arrival at their destination
- Connectivity to the ground means cabin crews can help passengers to change their onward transit plans to accommodate for changes to their flight, while they are still in the air.
- Globally, more than 30 airlines allow voice calls and internet access during flights. It would enable Indian carriers to compete with their foreign peers.
- Foreign carriers which earlier had to switch off in-service connectivity while flying over Indian Airspace will no longer have to do so.
- Business travelers greatly value these services as they can continue their work commitments without any deterrence.

- Other travelers can be in touch with their near and dear ones even during the flight.

Challenges ahead:

- The high cost of installing equipment may discourage low-cost carriers and even for full-service carriers, the service may come at a premium.
- Airlines will have to bear the initial cost of installing antennae on aircraft. So, the additional cost could find a way into ticket prices.
- Apart from the equipment, airlines will have to bear additional fuel costs, given the extra weight and drag aircraft will face due to the antenna.
- Satellites divide geographical regions into smaller areas to provide broadband connectivity, which is efficient for fixed residents and low speed mobility. Providing internet connectivity to high-speed aircraft requires frequent hand-offs, which increases the level of interference and hampers the quality of service.
- In-flight connectivity provides relatively slow speeds of Internet.
- There are security risks due to possible interference with flight communication systems.
- Expensive service which may increase the flight ticket price
- Technology and laws allow calls to be made from aircraft, but many airlines do not want noisy cabins.

Conclusion:

In-flight Wi-Fi connectivity is subject to factors like the number of concurrent users, satellite coverage and weather conditions. Most airlines discourage voice calls to avoid inconvenience to fellow passengers. Once launched, these factors would be important factors that decide its success. However, IFC is great news, but to woo price-sensitive Indian customers, airlines need to provide affordable tariffs. Since cheaper tariff will be a burden for airlines, they need to find a balanced tariff or provide Wi-Fi as an add-on; they can also consider generating revenue from ads, corporate offerings, e-commerce, premium content, etc.

AI and robotics for public health is a real need and has demonstrated great value in addressing pandemics like Covid-19. Do you agree? Comment. (250 words)

Reference: [Business Standard](#)

Why this question:

The article presents a view that while Robots have been pressed into service for isolated patients the hopes are high that artificial intelligence can help find a counter to Covid- 19.

Key demand of the question:

The answer must discuss the role that AI and robotics can possibly play in addressing public health concerns such as that of Covid-19.

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

Start with any fascinating fact about robotics and AI applications.

Body:

First, bring out the challenges the public health sector is facing amidst such pandemics. Explain that the coronavirus is putting a lot of new tech, including robots and artificial intelligence, on display. Mention facts such as – New technology like infrared thermometers — potentially unreliable devices [known as “thermometer guns”](#) — are becoming increasingly commonplace in China. Robots are being used to disinfect rooms, communicate with isolated people, take vital information, and

deliver medications. AI is being used to study the outbreak's spread and is powering the search for treatments. Suggest the possible utility of the two to the public health sector, discuss concerns and challenges if any. Suggest solutions.

Conclusion:

Conclude by reasserting the significance of such technologies in such grave situations.

Introduction

The emergence of the novel coronavirus has left the world in turmoil. COVID-19, the disease caused by the virus, has reached virtually every corner of the world, with the number of cases exceeding a million and the number of deaths more than 50,000 worldwide. It is a situation that will affect us all in one way or another.

In response to this growing crisis, many of these agencies and entities are turning to AI (Artificial Intelligence) and related technologies like **robotics combined with AI** for support in unique and innovative ways. **Enhancing surveillance, monitoring and detection capabilities** is high on the priority list.

Body

Application of Artificial Intelligence in Pandemics

- **Disease surveillance:** Human activity -especially migration- has been responsible for the spread of the virus around the world.
 - In the near and distant future, technology like this may be used to predict zoonotic infection risk to humans considering variables such as climate change and human activity.
 - The combined analysis of personal, clinical, travel and social data including family history and lifestyle habits obtained from sources like social media would enable more accurate and precise predictions of individual risk profiles and healthcare results.
- **Predicting Outbreaks:** On December 30, an artificial-intelligence company called **BlueDot**, which uses machine learning to monitor outbreaks of infectious diseases around the world, alerted clients—including various governments, hospitals, and businesses—to an unusual bump in pneumonia cases in Wuhan, China.
 - An automated service called **HealthMap** at Boston Children's Hospital also caught those first signs. As did a model run by **Metabiota**, based in San Francisco. That AI could spot an outbreak on the other side of the world is significant, and early warnings save lives.
 - It would be another nine days before the World Health Organization officially flagged what we've all come to know as Covid-19.
- **Early Diagnosis:** AI has a proven track record here. Machine-learning models for examining medical images can catch early signs of disease that human doctors miss, from eye disease to heart conditions to cancer. But these models typically require a lot of data to learn from.
- **Automatic temperature measurement:** Automated camera systems used in conjunction with thermal sensors and vision algorithms on autonomous or remotely operated robots could be used to monitor temperatures of patients in hospitals.
 - **Example:** In the **United States**, a surveillance company announced that its AI-enhanced thermal cameras can detect fevers, while in **Thailand**, **border officers at airports** are already piloting a **biometric screening system using fever-detecting cameras**.
- **Virtual healthcare assistants:** The number of COVID-19 cases has shown that healthcare systems and response measures can be overwhelmed. Canada-based Stallion.

- AI has leveraged its natural language processing capabilities to build a multi-lingual virtual healthcare agent that can answer questions related to COVID-19, provide reliable information and clear guidelines, recommend protection measures, check and monitor symptoms, and advise individuals whether they need hospital screening or self-isolation at their homes.
- **Intelligent drones and robots:** The public deployment of drones and robots has been accelerated due to the strict social distancing measures required to contain the virus' spread.
 - To ensure compliance, some drones are used to track individuals not using facemasks in public, while others are used to broadcast information to larger audiences and also disinfect public spaces.
- **Curative research:** Part of what has troubled the scientific community is the absence of a definitive cure for the virus.
 - AI can lead the charge for the development of antibodies and vaccines for the novel coronavirus, either entirely designed from scratch or through drug repurposing.
 - For instance, using its **AlphaFold** system, **Google's** AI company, **DeepMind**, is creating structure models of proteins that have been linked with the virus in a bid to aid the science world's comprehension of the virus.
 - Although the results have not been experimentally verified, it represents a step in the right direction.

Application of Robotics in Pandemics

- **Disinfecting surfaces:** Large and small autonomous or remote-controlled robots could be developed to locate and constantly sterilize frequently touched surfaces with ultraviolet light.
- **Contract Tracing:** The roboticists say combining existing security systems with facial recognition software could allow authorities to retrace the steps of patients who tested positive for COVID-19 and contact others who might be at risk, which is known as contact tracing.
- **Nasal swabs:** Testing for coronavirus involves inserting a swab fairly deep into a patient's nasal cavity.
 - There are parts of the process that puts humans at risk of contracting the virus, including collecting the sample, handling the sample, transferring the sample to the test location and the test itself.
 - Automated or **robot-assisted nasopharyngeal and oropharyngeal swabbing** may speed up the process, reduce the risk of infection, and free up staff for other tasks.
- **Medicine Delivery:** Autonomous drones and ground robots can be used to deliver medicine to patients who have the coronavirus.
 - In the field hospital in **Wuhan, China**, **CloudMinds robots** were used to deliver food, drink and medicine to patients.
- **Social Robots:** In the time of isolation and quarantine, social robots can help people provide **social stimulation and interactions**, in addition to providing reminders to follow treatment regimens (to the elderly).

Conclusion

The advantage of technology can be leveraged to tackle pandemics, especially those like covid-19 which has overwhelmed the nations of the world. Cooperation and technology sharing for the benefit of mankind can go a long way in combatting the consequences of the disease outbreak. It will also help in the prediction of future outbreaks and be better prepared for such situations.

Discuss whether Indian agriculture sector is ready for UAV/drone technology application? Highlight the challenges and suggest solutions. (250 words)

Reference: [Indian Express](#)

Why this question:

The article presents the prospects of drone technology to the agricultural systems of the world.

Key demand of the question:

The answer must discuss the significance

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain the technological advancements in the field of agriculture in India and in the developed countries.

Body:

Discuss what UAVs/drones are.

Explain first how India can learn from China, Japan in use of UAVs for improved pest management and crop productivity.

Highlight the challenges that Indian farmers are facing.

Explain in what way the Drones as a technology can address many of these challenges.

Conclusion:

Conclude that It would be in the interest of farmers and even the industry if UAV/drone technology can be deployed for agrochemical applications.

Introduction:

Satellite-driven technology, big data analytics, and digital solutions are helping farmers in many countries today make more informed cropping decisions with regard to weather, soil nutrient application, and pest and disease control. The use of drones can have a major impact on our farms by spraying of agrochemical products, and this needs quick government intervention.

Body:

Benefits of using Drone technology in Indian agriculture:

- Increased efficiency and precision of agrochemical applications, in turn, leading to improved pest management and crop productivity as well as a significant reduction in operator exposure during spray operations.
- The field capacity of drone-assisted spraying is about 20 times higher than that of manual spraying.
- The other benefits are lower water consumption (as the material is sprayed in concentrated formulations) and the development of licensed applicators.
- These include community spraying professionals who may provide application services to farmers similar to combine harvester operators, thereby creating new skilled employment potential in rural India.

Challenges faced by Indian agriculture sector:

- fragmented landholdings.
- lack of adequate market access

- rising costs (especially of human labor)
- poor/below par yields in most crops
- low usage of modern technology relative to their counterparts in the US, Europe, Brazil, Argentina or China.

Measures needed:

- The government, both at the Centre and states, must respond in a timely manner through a sound regulatory framework, so as to prevent uncontrolled and inappropriate use.
- The focus should be to minimize the potential risks that come with the unfamiliarity and rapid adoption of an emerging technology.
- The steps in establishing a robust policy framework is to identify the various risks associated with drone application and the processes to deal with them.
- These cover the specifications for the drones/UAVs and the agrochemical formulations being used, the capabilities of the spray operators and training standards, and environmental variables.
- Based on these, a Standard Operating Procedure (SOP) should be put in place for spray operators, drone manufacturers and agrochemical companies to comply with.
- The necessary regulations should take into consideration (1) civil aviation laws (both local and umbrella) and the setting of vehicle specifications, (2) SOPs and piloting requirements for safe use, and (3) product approvals and permissions for spray operations.
- setting up a system for certification or licensing of drone operators to ensure their capability for piloting the UAV machines safely.
- Such certification/licensing should be subject to regular renewals and conducting of refresher courses.
- The authorities should also accredit training facilities to put in place a standardized programme for all agricultural drone operations.
- India can learn from China, Japan in use of UAVs for improved pest management and crop productivity.

Conclusion:

It would be in the interest of farmers and even the industry if UAV/drone technology can be deployed for agrochemical applications. This should be supported by a robust and pragmatic science-based policy framework, with Japan's revised guidance document serving as the most suitable point of reference for drafting our regulations.

What are vaccines? How are they made? Discuss how do they function.(250 words)

Reference: [The Hindu](#)

Why this question:

The question is straightforward and aims to explain the concept of vaccines, how they are made and their functionality.

Key demand of the question:

Explain the making of vaccines and their functions.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly define what vaccines are. Vaccines are one of the most effective tools to prevent diseases.

**Body:**

Provide for a brief overview on vaccines.

Discuss how vaccines are made; explain the multiple ways that are available.

Explain the stages of development of vaccines.

Explain immune system, effect of vaccines over it.

Discuss the scenario of India.

Conclusion:

Conclude by reasserting significance of vaccines.

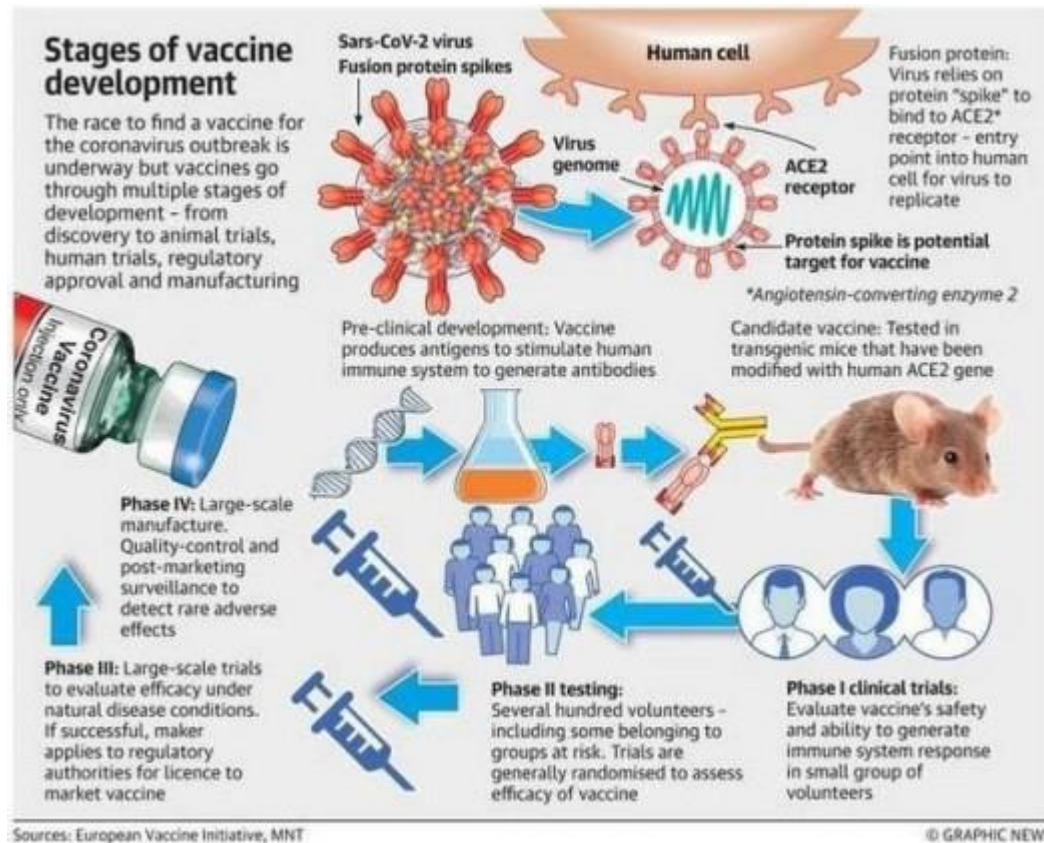

Introduction:

A vaccine is a substance that resembles the disease-causing agent (also called pathogen) but does not cause the disease. It trains the body's immune system to recognize and kill the pathogen, and creates a memory for the future. Vaccines are available to protect us against many life-threatening diseases such as polio, influenza, meningitis, typhoid, tetanus, diphtheria, and certain types of cancers. Vaccines have also been responsible for eradication (or near eradication) of deadly diseases such as smallpox and polio.

Body:

According to WHO, a vaccine helps the body's immune system to recognize and fight pathogens like viruses or bacteria, which then keeps us safe from the diseases they cause. Vaccination is one of the most effective ways to prevent diseases. Vaccines protect against more than 25 debilitating or life-threatening diseases, including measles, polio, tetanus, diphtheria, meningitis, influenza, tetanus, typhoid and cervical cancer. WHO estimates that at least 10 million deaths were prevented between 2010 and 2015 thanks to vaccinations delivered around the world.

Making of Vaccines:

- Vaccines are made using the disease-causing virus or bacteria, but in a form that will not harm your child. Instead, the weakened, killed, or partial virus or bacteria prompts your baby's immune system to develop antibodies, or defenders, against the disease.
- Once it is determined how the virus and bacteria will be modified, vaccines are created through a general three-step process:
- Antigen is generated. Viruses are grown in primary cells (i.e. chicken eggs for the influenza vaccine), or on continuous cell lines (i.e. human cultured cells for hepatitis b vaccine); bacteria is grown in bioreactors (i.e. Hib vaccine).
- Antigen is isolated from the cells used to create it.
- Vaccine is made by adding adjuvant, stabilizers and preservatives. Adjuvants increase immune response of the antigen; stabilizers increase the vaccine's storage life; and preservatives allow for the use of multi-dose vials.

Functioning of Vaccines:

- A vaccine works by training the immune system to recognize and combat pathogens, either viruses or bacteria.
- To do this, certain molecules from the pathogen must be introduced into the body to trigger an immune response.
- These molecules are called antigens, and they are present on all viruses and bacteria.
- By injecting these antigens into the body, the immune system can safely learn to recognize them as hostile invaders, produce antibodies, and remember them for the future.
- If the bacteria or virus reappears, the immune system will recognize the antigens immediately and attack aggressively well before the pathogen can spread and cause sickness.

Conclusion:

According to the World Health Organization, over 40 different candidate vaccines for COVID-19 are in development. These include an inactivated vaccine being developed in China (Sinovac) using purified COVID-19 virus killed with formaldehyde (a chemical). A live attenuated vaccine being developed by Codagenix, a U.S.-based company in partnership with the Serum Institute of India (Pune), uses a genetically engineered COVID-19 virus that replicates very poorly. There are multiple other vaccine candidates under development that use DNA, RNA, viral vector and subunit protein platforms.

Discuss the promises that the National Mission on Quantum Technologies and Applications hold for India in the race of quantum revolution. Also comment on the associated constraints. (250 words)

Reference: [The Hindu](#)

Why this question:

The government, in its [Budget 2020](#), had announced a National Mission on Quantum Technologies & Applications (NM-QTA) with a total budget outlay of Rs 8000 Crore for a period of five years to be implemented by the Department of Science & Technology (DST). Thus the context of the question.

Key demand of the question:

One must explain the prospects of National Mission on Quantum Technologies and Applications for India in the quantum revolution race while bringing out the challenges it may face in it.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain what quantum technologies are, what their applications are.

Body:

Talk about the National Mission on Quantum Technologies and Applications (NM-QTA).

The Mission will be able to address the ever increasing technological requirements of the society, and take into account the international technology trends and road maps of leading countries for the development of next generation technologies.

The areas of focus for the NM-QTA Mission will be in fundamental science, translation, technology development and towards addressing issues concerning national priorities. The mission can help prepare next generation skilled manpower, boost translational research and also encourage entrepreneurship and start-up ecosystem development.

Explain the challenges associated.

Discuss applications and significance.

Conclusion:

Conclude with way forward.

Introduction:

Quantum Technology is based on the principles of quantum theory, which explains the nature of energy and matter on the atomic and subatomic level. It concerns the control and manipulation of quantum systems, with the goal of achieving information processing beyond the limits of the classical world. Quantum principles will be used for engineering solutions to extremely complex problems in computing, communications, sensing, chemistry, cryptography, imaging and mechanics.

The government, in its Budget 2020, had announced a National Mission on Quantum Technologies & Applications (NM-QTA) with a total budget outlay of Rs 8000 Crore for a period of five years to be implemented by the Department of Science & Technology (DST).

Body:

Key features of the scheme:

- The areas of focus for the mission will be in fundamental science, translation, technology development, human and infrastructural resource generation, and start-ups to address national issues.
- The applications under the mission include aerospace engineering, numerical weather prediction, simulations, securing communications and financial transactions, cybersecurity, advanced manufacturing, health, agriculture, and education.
- The mission plans to draw upon the existing strengths within academic institutes across India to support interdisciplinary research projects in key verticals involving quantum technology. It will try to develop key foundational strengths in important core areas.
- It has become imperative both for the government and industries to be prepared to develop these emerging and disruptive technologies to secure communications and financial transactions, remain competitive, drive societal progress, generate employment, foster economic growth, and to improve the overall quality of life, the release stated.

Conventional computers process information in 'bits' or 1s and 0s, following classical physics under which our computers can process a '1' or a '0' at a time. Quantum computers compute in 'qubits' (or quantum bits). They exploit the properties of quantum mechanics, the science that governs how matter behaves on the atomic scale. In this scheme of things, processors can be a 1 and a 0 simultaneously, a state called quantum superposition. Because of quantum superposition, a quantum computer — if it works to plan — can mimic several classical computers working in parallel.

Applications:

▪ **Secure Communication:**

- China recently demonstrated secure quantum communication links between terrestrial stations and satellites.
- This area is significant to satellites, military and cyber security among others as it promises unimaginably fast computing and safe, unhackable satellite communication to its users.

▪ **Research:**

- It can help in solving some of the fundamental questions in physics related to gravity, black hole etc.
- Similarly, the quantum initiative could give a big boost to the Genome India project, a collaborative effort of 20 institutions to enable new efficiencies in life sciences, agriculture and medicine.

▪ **Disaster Management:**

- Tsunamis, drought, earthquakes and floods may become more predictable with quantum applications.
- The collection of data regarding climate change can be streamlined in a better way through quantum technology. This in turn will have a profound impact on agriculture, food technology chains and the limiting of farmland wastage.

▪ **Pharmaceutical industry:**

- India's interest in the pharmaceutical and healthcare industry is huge.
- Quantum computing could reduce the time frame of the discovery of new molecules and related processes to a few days from the present 10-year slog that scientists put in.
- For instance, tracking protein behaviour or even modelling new proteins with the help of quantum computers could be made easier and faster.
- Tackling chronic diseases like cancer, Alzheimer's and heart ailments is a big possibility of the technology.

▪ **Augmenting Industrial revolution 4.0:**

- Quantum computing is an integral part of Industrial revolution 4.0.
- Success in it will help in Strategic initiatives aimed at leveraging other Industrial revolution 4.0 technologies like the Internet-of-Things, machine learning, robotics, and

artificial intelligence across sectors will further help in laying the foundation of the Knowledge economy.

Concerns:

- The challenge lies in harnessing the properties of quantum superposition in a highly controlled manner. The qubits tend to be very fragile and lose their “quantumness” if not controlled properly. Also, a careful choice of materials, design and engineering is required to get them to work.
- On the theoretical front lies the challenge of creating the algorithms and applications for quantum computers.
- These projects will also place new demands on classical control hardware as well as software platforms.
- Further, Information technology-based security infrastructure would never be the same once quantum systems become a reality, given the ultra-fast speed of computing power.
- Warfare and conflict strategists will have new challenges to face.
- In such scenarios India’s current plans may have to be reworked to develop integrated war-theatre strategies factoring in quantum technologies.

Way forward:

- An unprecedented collaboration between physicists (both experimentalists and theorists), computer scientists, material scientists and engineers.
- Government needs to partner institutions and the scientific community to work out details of the mission and roll it out quickly.
- Private funding, both via industry and philanthropy, can play an outsized role even with much smaller amounts.

Conclusion:

With a solid research base and workforce founded on significant and reliable government support, it can lead to the creation of innovative applications by industries, thereby stimulating economic growth and job creation, which will feed back into a growing quantum-based economy. The government’s financial and organizational support will also ensure that both public and private sectors will benefit. It will establish standards to be applied to all research and help stimulate a pipeline to support research and applications well into the future.

What is Laser Surface Micro texturing? Discuss the significance of it.(250 words)

Reference: pib.go.in

Why this question:

International Advanced Centre for Powder Metallurgy & New Materials (ARCI), an autonomous R&D Centre of Department of Science and Technology (DST), has recently developed ultrafast laser surface texturing technology, which can improve the fuel efficiency of internal combustion engines. Thus the context of the question.

Key demand of the question:

Deliberate what laser surface micro texturing technology is and explain how does it help to improve fuel efficiency of internal combustion engines.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Telegram: <https://t.me/insightsIAStips>

Facebook: <https://www.facebook.com/insightsonindia>

Introduction:

Briefly define Laser Surface Micro texturing.

Body:

In this technology, a pulsating laser beam creates micro-dimples or grooves on the surface of materials in a very controlled manner.

The texture surfaces were created on automotive internal combustion engine components, piston rings and cylinder liners using 100 fs pulse duration laser.

The created textures were tested in an engine test ring under different speeds and temperatures of coolant and lubrication oil.

Explain the significance of the technology –

It offers precise control of the size, shape and density of micro-surface texture features and has gained momentum as a way to control friction and wear.

Textures can trap wear debris when operating under dry sliding conditions and sometimes provide effects like enhancing oil supply (lubricant reservoir) which can lower friction coefficients and may enable reduced wear rate.

By using this there was a 16% reduction in the lube oil consumption with the use of texture on the piston rings.

Fabrication of a pattern of micro dimples or grooves on the surface of materials results in a change in surface topography which generates additional hydrodynamic pressure, thereby increasing the load-carrying capacity of the surfaces.

Hence these become useful for trapping wear debris when operating under dry sliding conditions and sometimes provide effects like enhancing oil supply (lubricant reservoir) which can lower friction coefficients and may enable reduced wear rate etc.

Conclusion:

Conclude with way forward.

Introduction:

Laser surface micro-texturing offers precise control of the size, shape and density of micro-surface texture features. In this technology, a pulsating laser beam creates micro-dimples or grooves on the surface of materials in a very controlled manner. The International Advanced Centre for Powder Metallurgy & New Materials (ARCI) has developed ultrafast laser surface texturing technology, which can improve the fuel efficiency of internal combustion engines.

Body:

Laser surface micro-texturing:

- In this technology, a pulsating laser beam creates micro-dimples or grooves on the surface of materials in a very controlled manner.
- Such textures can trap wear debris when operating under dry sliding conditions and sometimes provide effects like enhancing oil supply (lubricant reservoir) which can lower friction coefficients and may enable reduced wear rate.
- The texture surfaces were created on automotive internal combustion engine components, piston rings and cylinder liners using 100 fs pulse duration laser.
- The micro dimples of 10-20 μm diameter and about 5-10 μm deep which have been created with laser beams had a regular pattern.

Properties / advantages of micro-texturing using ultrashort pulse lasers are:

- Machining of extremely small features of down to 10 μm or smaller
- Very high depth resolution (sub-micrometer)
- Works on nearly every material, including very hard materials

- Negligible heat effects: no melt, burrs, or other damage
- Contact and force-free process

Significance:

- The created textures were tested in an engine test rig under different speeds and temperatures of coolant and lubrication oil, and it was observed that there was a 16% reduction in the lube oil consumption with the use of texture on the piston rings.
- The 10-hour lube oil consumption test shows that the blow-by substantially reduced with textured rings.
- Fabrication of a pattern of micro dimples or grooves on the surface of materials results in a change in surface topography which generates additional hydrodynamic pressure, thereby increasing the load-carrying capacity of the surfaces.
- These textures can become useful for trapping wear debris when operating under dry sliding conditions and sometimes provide effects like enhancing oil supply (lubricant reservoir) which can lower friction coefficients and may enable reduced wear rate.

Application areas: There are various applications for the types of textures that can be produced using laser micro-texturing:

- **Decorative textures** – Improving the look of parts by adding high definition / low relief textures or LIPSS / color effects to parts
- **Tribology** – Changing frictional properties, e.g., reducing friction on moving parts (seals, bearings) or creating soft-touch consumer or medical parts
- **Wetting** – Making surfaces super-hydrophobic (water repellent) or super-hydrophilic
- **Optical properties** – Altering the surface to reduce glare, change the absorption of light, or even act as a diffraction grating (using LIPSS).

“The science deficit in our society has raised its ugly head and highlighted the paradox embedded in us”. Do you agree with the statement? Elucidate.(250 words)

Reference: [Hindustan Times](#)

Why this question:

The article talks about the significance of scientific temper in the society and its relevance.

Key demand of the question:

Explain the ill effects of science deficit in our society. Discuss what it has led us to and what needs to be done to overcome it.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly define scientific temper and its importance.

Body:

Explain why there is deficit of scientific temper in our societies.

One can quote the response people are giving amidst the covid-19 scare such as reports of stigmatisation, ostracisation and eviction of not just those suspected of infection, but of airline staff who ferried them, and worse, of medical workers etc. that justify the deficit of scientific thinking and decision making.

Discuss the ill-effects it is making on the society.

Suggest solutions to address the issue.

Conclusion:

Conclude with need to develop scientific temper among all the people of the society.

Introduction:

Scientific temper is a way of thinking and acting which uses a method, including observing physical reality, questioning, testing, hypothesizing, analysing and communicating. It involves the application of logic and the avoidance of bias and preconceived notions in arriving at decisions, and becomes particularly valuable while deciding what is best for the community or the nation. **Article 51A of the Constitution** lists the fundamental duties of citizens, which include development of scientific temper, humanism and spirit of inquiry and reform. It means the Indians must have an open mind to learn new things.

Body:

Recent instances of science deficit in our society:

- The recent events after Janata curfew called in by PM had claims that the cumulative reverberations like it “boosted blood circulation in the body” and “rendered the virus ineffective”.
- Some super-obedient ones, including the Pilibhit district magistrate, led clanging and conch-blowing processions while being dangerously undistanced.
- A story snowballed on social media that the virus had indeed “receded” as per satellite data gathered by NASA, prompting this government to ask social media companies to control the spread of misinformation.
- The minister of state for social justice and empowerment thought it appropriate to lead a tight cluster of people to chant “Go Corona Go”.
- This inspired replication by even larger gatherings in the unlikeliest of places such as “IT-city” Bengaluru’s airport.
- People drank cow urine as a preventive against the virus (even as they held their noses), egged on and applauded by people holding public office.

Science-deficit and paradoxes:

- On the one hand, Indians have embraced modern technologies in daily living, with mobile phones and foetal diagnosis equipment penetrating deep into the rural hinterland. Chandrayaan-2 caught the public imagination. On the other hand, among the same people, there appears to be little recognition of the science that underlies these technologies.
- Solar and lunar eclipses witness countrywide shut-downs, with pregnant women caged in, food thrown away, and science graduates, engineers and even PhDs watching eclipses on TV instead of experiencing, learning from, and teaching about the beauty of the real spectacle.
- Claiming cow urine to be a treatment for Covid-19 is part and parcel of a deep-rooted deficit of scientific temper even in our educated populace.

Dangers posed by the science-deficit:

- Reports of stigmatization, ostracisation and eviction of not just those suspected of infection, but of airline staff who ferried them, and worse, of medical workers, are trickling in daily.
- Coming right after the public applause for medical doctors, this is a sad reflection on our values. But it also shows a basic lack of understanding of how flu-like infections work.

**Reasons behind the science-deficit:**

- Our early science education is hugely culpable.
- It values information load over understanding, has sidelined learning-by-doing, and built a culture of unquestioning obedience.
- There is also a lack of clarity as to why we are teaching science and not just how. Science is thought of as a subject and not as a way of life.
- Science research in laboratories is driven a bit by curiosity, but mostly for personal livelihood and glory. There is no demand to subscribe to the scientific method as a way of life.
- Scientists are typically quite disengaged from early science education, and appear to be content to skim the cream that willy-nilly floats to the top, with no regard to the scientifically illiterate sea below.
- Finally, surprisingly few scientists engage with lay audiences, mass media or the government.
- And the State, while not demanding that public engagement be an imperative in our taxpayer-funded science institutions, is not even, for example, enforcing the Cable Television Networks law which prohibits content that encourages superstition or blind belief.

Measures needed to inculcate scientific temper:

- In such a situation of social and cultural malaise, a major role of Scientific Temper is to revive confidence and hope and to dispel fatalistic outlook.
- The campaign to promote Scientific Temper must inculcate values like equality and dignity of all human beings, distributive justice, dignity of labour, and social accountability of one's actions.
- Although big science (space probes, cosmic ray physics, etc.,) has served India well, the nation must also look at areas that are less eyeball-grabbing, such as water resources, agriculture and the environment, he said, requesting anonymity because he is not allowed to talk to the press.
- science and scientists must have a position of pride in society which can influence many young students to move into scientific fields.
- A nationwide science policy which should be able to anticipate problem areas, devise course correction.
- Better funding of Science and Technology initiatives which would help in development of the society.
- All these are essential for bringing about social, economic and cultural transformation of our country.

Conclusion:

Scientific temper needs to be promoted across all sections of the society systematically, using tools like National Knowledge Network. Public and political understanding of science should be based on evidence and debate with open mind.

Awareness in the fields of IT, Space, Computers, robotics, nano-technology, bio-technology and issues relating to intellectual property rights.

As commercialization and privatization transform humankind's activity in outer space, India needs imperative and drastic reforms in its space sector. Discuss. (250 words)

Reference: [Indian Express](#)

Why this question:

At author talks about the changing dynamics of outer space and the transformation of commercialization and privatization that it has witnessed in the recent years and how at the same time India needs to ace-up.

Key demand of the question:

The answer must present an analysis of the changing dynamics of the space as an avenue of commercialization and where India stands today and what needs to be done in the coming future.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain the aspects of Space and the space race the world countries are contesting.

Body:

Highlight first the growing role of the private sector and the effort by nations in Space research, development and exploration. Discuss the aspects of privatization and commercialization of space. Take hints from the article and discuss where does India stand? What are the challenges before it and how should it overcome them. Suggest the leap forward that India is yet to take and must focus on the reforms and radical changes in its approach to Space.

Conclusion:

Conclude by reasserting the significance of Space as an avenue for commercialization and future for many.

Introduction:

Space programmes have for long been viewed as either strategic or symbols of national prestige for big countries that are prepared to invest significant resources in the pursuit of a credible presence in outer space. India, however, is quite some distance away from adapting to the unfolding changes in the global space business. In its early years, India's space programme that was constrained by lack of resources found innovative ways of getting ahead in space.

Body:

Commercialization and privatization is transforming humankind's activity in outer space:

- Japan is scheduled to launch the UAE Mars probe this year.
- India's own ISRO is also working with the UAE on its Mars mission.
- The first Emirati Astronaut, Hazza al-Mansouri spent more than a week in the US-Russian space station.
- Luxembourg has a similar strategy. It too entered the space sector only in the middle of the last decade. It is also driven by the need for economic diversification.
- Military uses of space and prestige projects like Moon-landing have emerged, major private sector entities already in the aviation industry like Boeing and Lockheed won space contracts in the US.

- As the digital revolution in the 21st century transformed the world economy, the commercial space sector has begun to grow in leaps and bounds. The global space business is now estimated to be around \$ 400 billion and is expected easily rise to at least trillion dollars by 2040.
- The entry of private sector has begun to drive down the cost-per-launch through innovations such as reusable rockets.
- SpaceX plans to launch hundreds of satellites into the low-earth orbit to provide internet services. Amazon has plans to build a network of more than 3,000 satellites in the low-earth orbit.
- SpaceX and Amazon have plans to develop space tourism and build human settlements on the Moon and on Mars.
- It is not just big companies that are aiming for the Moon. Last year, a private company in Israel sent a lunar lander to the Moon.
- Although the lander crashed, much like India's Vikram, the private sector has begun to do things that were once the monopoly of national agencies.

Potential advantages of rising Space industry for India:

- Adding an edge to India's foreign policy as our space capabilities can be a part of our initiatives to foster new relationships,
- Avoiding the outflow of tax-payer's money to foreign hands from where we procure turnkey products and services,
- Creating more opportunities for foreign direct investments (FDI), as well as new jobs for highly-skilled labour market,
- Empowering India's defence system by equipping it with space technology, and allowing armed forces to procure defence products and services indigenously, and
- Reversing the brain-drain from India.

Challenges for private space entities in India:

- **Monopoly:** In India 'Space' means Indian Space Research Organization. Globally the technology is highly protected because of its dual use capability. Even if it was not, it would be prohibitively expensive. Although ISRO encourages private sector participation in the national space programme, its model is still very 20th century — in terms of governmental domination.
- **Funding:** A major challenge in setting up a space business in India is funding. Space industry is capital intensive and upstream activities come with a long gestation period.
- **Investor's Dilemma:** The lack of clarity among the investors and lack of the ecosystem required for significant contribution is a challenge for the investors.
- **Lack of Regulation:** India is a party to the **Outer Space Treaty**, where one of the fundamental requirements laid upon states is the supervision of space activities within its borders, the country did not have any formally legislated laws. This is a potential roadblock for commercialization.
- **Growth Challenges:** Scaling up, international marketing and funding are challenges.
- **Lack of Support:** The Indian ecosystem has neither incubation support nor pointers to seek support of leaders such as ISRO for space start-ups.
- **Political and bureaucratic hurdles** limit private space operations in India.
- Low in-house capacity of ISRO restricts them to very few launches in a year. Privatization can offload 30-40% of the work and help them work more efficiently.

Way forward:

- India should have **national space activities legislation** which takes on board all stakeholders.
- A **public-private partnership (PPP) model** can be looked into to realise ISRO's workhorse Polar Satellite Launch Vehicle (PSLV), with a joint venture between ISRO and the private sector.
- In the UK, space ventures are treated as a complement to big organizations and not a competitor. This should be encouraged in India too.
- A **supportive international partner and likeminded local partners** helps to set up a space business.
- The idea should be to let the private industry build their own facilities after gaining enough expertise.
- ISRO has built a space technology park spread over 25 acres in Bengaluru where the entire range of facilities have been set up for use by the industry.
- It needs a regulatory environment that encourages a more dynamic role for the private sector and promotes innovation. It will be a pity if India squanders the many advantages of its early start in space by delaying the much-needed reform and reorganization of its space sector.

Conclusion:

The private sector already supplies majority of the sub-systems in satellite manufacturing. This can be further scaled up into other activities with proper regulation and partnership of the ISRO and private sector. The country must deregulate the space sector to encourage private enterprise if we are to compete in the new space economy.

What are the threats and challenges modeled by the use of crypto currencies as a substitute to the customary currencies? Explain. (250 words)

Reference: [Live Mint](#)

Why this question:

In April 2018, the Reserve Bank of India (RBI) had barred regulated entities such as banks from dealing in bitcoins and other virtual currencies. The Supreme Court has now lifted the restriction.

Key demand of the question:

The answer must discuss about crypto currencies: merits and demerits with special focus on the challenges that they pose as a substitute to the regular currency.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly explain what crypto currencies are.

Body:

Cryptocurrencies are internet-based mediums of exchange. They are digital currencies that can be exchanged between parties without the need of a third entity, like a bank.

Discuss the risks associated with Cryptocurrencies, explain that Cryptocurrencies are vulnerable to cyber hacking and data privacy breaches and increase the risk of money laundering. They do not have any fundamental value as they are not legal tender, and are not backed by governments, central banks or a pool of assets.

They are a poor medium of exchange also because their valuation tends to be excessively volatile and susceptible to manipulation. They are seen as instruments of speculation and transactions that are below the radar of regulators and law enforcement agencies etc.

Discuss the worries of RBI associated with Cryptocurrencies.

Conclusion:

Conclude with the possible future of such technology.

Introduction:

A cryptocurrency is a digital or virtual currency that uses cryptography for security. Cryptocurrencies use decentralized technology to let users make secure payments and store money without the need to use their name or go through a bank. They run on a distributed public ledger called blockchain, which is a record of all transactions updated and held by currency holders. The most common cryptocurrencies are Bitcoin, Ethereum, Ripple, and Litecoin.

Body:

Cryptocurrency is a disrupter to traditional notions of currency:

- The government is wary that regulation will provide legitimacy to “what is currently ambiguous,” and may lead to further rise in its valuation and end up contributing “to the investment bubble”.
- A currency that is not based on any real economic activity, unlike a sovereign currency whose value is based on the relative value of a tradeable basket of goods and services, cannot prima facie inspire much comfort.
- Bitcoin’s value, astronomical even now at about \$8,300 but much below January 2018’s stratospheric levels, is based on demand for a fixed supply of Bitcoins in the future it cannot exceed 21 million in number, of which 18 million has already been mined.
- The security offered by encryption of cryptocurrency may be breached by hackers who are always lurking for any point of weakness. This may end up costing investors huge amounts of money because prices are attached to the currencies.
- Cryptocurrency exists only in essence such that there are no physical coins and notes. As a result, there is, therefore, no central place where the currency can be deposited for safe keeping.
- Lack of regulation of cryptocurrency means it is not under any control or supervision. This attracts more investors thereby increasing their chances of investing in this technology.
- Cryptos are feared not just for their sheer speculative propensities, but also for their capacity to undermine sovereign currencies (the latter is an exaggerated apprehension).
- Virtual currency is being traded anonymously over the Internet and used for a host of anti-national and illegal activities, from terror funding to illicit trade of arms and drugs and so on.
- The online use of this currency, was without any border restrictions or geographical constraints, resulting in danger to the integrity and sovereignty of the nation.
- However, it does not make sense to go overboard and criminalise merely adventurous crypto speculators. There are no official or other data available that point towards misuse of cryptocurrencies for illegal ends

However, there are a **few advantages of cryptocurrencies:**

- One of the reasons why cryptocurrencies have gained global appeal is because of their secure nature. Cryptocurrencies are encoded into a database.
- Cryptocurrency trading draws its legitimacy from the unanimity of the participants in its network. It has gained global approval by most leaders as a legal medium of payment.
- No transaction fees are usually charged for transactions involving cryptocurrency.
- Cryptocurrency does away with the need for a regulator.
- By making everything public, cryptocurrency negates the need for a middleman.

- According to bitcoin.org, no individual or organisation can manipulate Bitcoins because it is cryptographically secure and do not contain customers' personal information.

Measures needed:

- Governments the world over have banned cryptocurrencies as a medium of exchange, and India is no exception.
- Yet in India, an estimated 30 lakh Bitcoins are reportedly in circulation. From a value of a little over ₹60,000 at the start of 2017, the Bitcoin now commands a value of nearly ₹6 lakh, with a global market cap of \$10.2 trillion. Cryptos are recognised in the US as an asset class.
- Firms like Paypal, Uber, Visa and Mastercard have all signed up as part of the consortium to control it. Each has invested \$10 million.
- Criminalising possession of cryptocurrencies will impact such investments.
- Bankers and investors now consider the cryptocurrency market at par with derivatives. The NYSE plans Bitcoin futures through a platform called **Bakkt**.

Conclusion:

Underlying the crypto movement is a libertarian belief: Cryptos are an alternative asset to fiat currencies; controlled by none, they cannot be manipulated by governments with vested interests. Legalising the cryptomarket can help beneficiaries emerge from the shadows and make productive investments in an economy witnessing a digital transformation. Crypto conduct calls for regulation, but not outright criminalization.

Discuss the ethical and social concerns involved in Cord blood banking. (250 words)

Reference: [The Hindu](#)

Why this question:

Poona Citizen Doctor Forum (PCDF), a body that aims to rebuild trust among citizens and doctors, and promote ethical rational medical practice, has come forward to bust the aggressively promoted concept of cord blood banking.

Key demand of the question:

The answer must discuss the ethical and social concerns involved in Cord blood banking.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly define what cord blood banking is.

Body:

Cord blood (short for umbilical cord blood) is the blood that remains in the umbilical cord and placenta post-delivery. It contains special cells called hematopoietic stem cells that can be used to treat some types of diseases.

Discuss what the issues are with cord blood banking.

Over the past decade, stem cell banking has been aggressively marketed even as its use is still in experimental stages. But these companies charge enormous fees from parents to preserve cells.

Bring out the ethical concerns involved in detail.

Conclusion:

Suggest ways to address the ethical concerns involved and assert upon the need to have policies and frameworks to regulate them.

Introduction

Cord blood (short for umbilical cord blood) is the blood that remains in the umbilical cord and placenta post-delivery. At or near term, there is a maternal–fetal transfer of cells to boost the immune systems of both the mother and baby in preparation for labor. This makes cord blood at the time of delivery a rich source of stem cells and other cells of the immune system.

- Cord blood banking is the process of collecting the cord blood and extracting and cryogenically freezing its stem cells and other cells of the immune system for potential future medical use.
- Cord blood banking is more often referred to as **stem cell banking**.

Body

Social Issues and concerns with stem cell banking

- **Effectiveness: Cord Blood** is recommended as a source of hematopoietic stem cell (derived from bone marrow, peripheral blood, or umbilical cord blood) transplantation for hematological cancers and disorders where its use is recommended. For all other conditions, the use of cord blood as a source of stem cells is not yet established, as per ICMR.
- **Nexus between Doctors and Stem Cell Companies:** Activists say stem cell banking companies start approaching their prospective customers much before the delivery and offer competitive packages.
- **Expensive:** Private clinics charge exorbitant prices for storage, under the pretext that Cord blood cells supposedly helps the body re-generate tissues and systems and it's use as a regenerative medicine. Also, due to huge income inequality, many would find it hard to afford.
- **Not a biological insurance:** Although commercial cord blood banks often bill their services as “biological insurance” against future diseases, the blood doesn't often get used.
 - One study says the chance that a child will use their cord blood over their lifetime is between 1 in 400 and 1 in 200,000.
 - Current research says the stored blood may only be useful for 15 years.
- **Research is in infancy:** More work needs to be done to utilise the cord blood cells for treatment of diseases like Alzheimer's, Parkinson's etc. The stored blood can't always be used, even if the person develops a disease later on, because if the disease was caused by a genetic mutation, it would also be in the stem cells.

Ethical issues involved

- **Commercialization:** Luring unsuspecting parents into stem cell banking with profit as motive.
- Leveraging the **emotive** factor of child birth for expensive stem cell storage which may not be used or be effective.
- **Unethical nexus** between Doctors and Private stem cell banks, which extract data of the expecting parents.
- **Data privacy** of the to-be parents are revealed without consent
- **Ownership** of the deposit made is still controversial
- **Data Sharing:** Medical History of the family is often collected in the process. The sharing of this information is not regulated and may be sold to insurance companies for profit.
- **Public banks vs Private banks:** There is generally agreement or consensus in the guidelines that public storage for allogeneic transplants is preferable and that private storage should be discouraged.
- **Future prospects:** As the process is expensive, affordability is low. In future, if medical advancements are made, the benefit is accrued to a few wealthy individuals. This may create humanitarian issues.

Conclusion

The American Congress of Obstetricians and Gynecologists and the American Academy of Pediatrics and Indian Council of Medical Research ICMR don't recommend routine cord blood storage. The groups say private banks should only be used when there's a sibling with a medical condition who could benefit from the stem cells. Families are encouraged to donate stem cells to a public bank to help others.

Researchers are also exploring how cord blood has the ability to cross the blood–brain barrier and differentiate into neurons and other brain cells, which may be instrumental in treating conditions that have been untreatable up to this point. However, it is still in the experimental phase.

A law in this regard can help in regulating the area of work and address the ethical issues.

“Blockchain technology solutions are facilitating newer ways of doing business with remarkable efficiency”, Elucidate. (250 words)

Reference: [Financial Express](#)

Why this question:

The article brings out newer insights of the utility of Blockchain technology and in what way it is making the businesses of today more and more effective and efficient.

Key demand of the question:

The answer must discuss the significance of the applications of Blockchain technology to Businesses of today's world.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Define what Blockchain technology is.

Body:

Explain that Blockchain solutions are transforming the way companies and individuals do business, locally and globally, by simplifying transactions and increasing their efficiency.

Discuss that Blockchain works by establishing a peer-to-peer network where each participant maintains a database—a ledger—of all the network's transactions. Compiled into “blocks”, transactions are then linked together using cryptographic hashes forming a “chain”. The cryptographically-connected blocks create an underlying data layer that provides a common, unified view of information for parties who can access the data. This gives organizations a new way of establishing trusted business networks.

List down the advantages and applications.

Highlight the possible challenges involved.

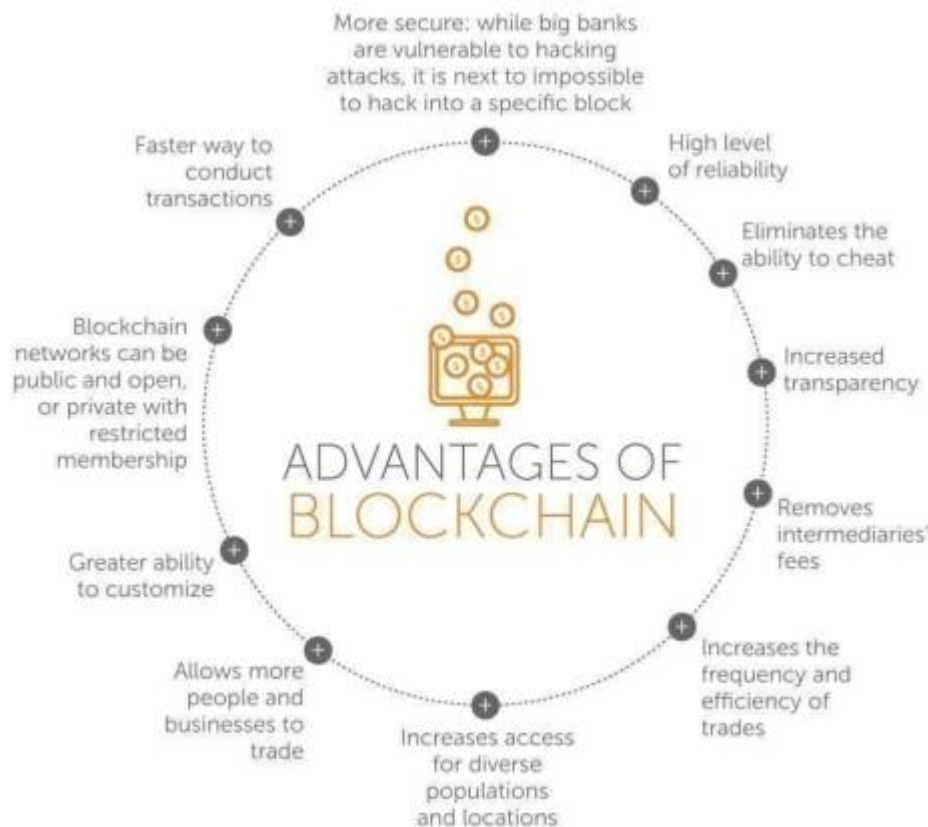

Conclusion:

Conclude by reasserting the significance of such technology.

Introduction:

Blockchains are a new data structure that is secure, cryptography-based, and distributed across a network. The technology supports cryptocurrencies such as Bitcoin, and the transfer of any data or digital asset. Anything recorded on them cannot be deleted, and is instantly uploaded to all users on that blockchain. Blockchain is being researched across the banking and financial services industries.

Body:

Prospects:

- Bitcoin is just one of the applications for the technology, whose use is being tested across industries.
- Healthcare, banking, education, agriculture, electricity distribution and land records are sectors that could benefit.
- Blockchain-powered smart contracts, where every piece of information is recorded can enhance ease of doing business.
- It will augment the credibility, accuracy and efficiency of a contract while reducing the risk of frauds, substantially.
- Blockchain could play a crucial part in health insurance claims management by reducing the risk of insurance claim frauds.
- The technology can also be used to prevent the sale of spurious drugs in the country by tracking every step of the supply chain network.
- Artificial Intelligence and Internet of Things (IoT) can gain immensely from blockchain applications.
- In an IoT world, thousands of devices would need to rapidly and seamlessly transact with each other in real time.
- The adoption of blockchain by India's banks could help avert frauds such as the one at Punjab National Bank as the technology updates information across all users simultaneously.
- It could be used to further strengthen our national institutions, including the judiciary and the Election Commission.
- Critical citizen information like land records, census data, birth and death records, business licenses, criminal records, intellectual property registry, electoral rolls could all be maintained as blockchain-powered, tamper-proof public ledgers.

Challenges:

- Blockchain technology is expensive to initially put it in place.
- The massive usage of energy for the functioning of blockchain.
- Safeguarding the privacy of individuals and companies as blockchains are usually open ledgers for everyone to see.
- Knowledge of the benefits of distributed ledger technology is still limited.
- If automated risk management, smart contracts, and similar tools are deployed across a network, cascades of rapid and hard-to-control obligations and liquidity flows could propagate across a network.
- This interdependence will likely call for creative organizational thinking to address the need for governance and strong risk management

Way Forward:

- Blockchain, with all its possibilities, needs a serious look at its vulnerabilities and commerciality.
- Before introducing blockchain into the public sector data-handling system, we need a robust and informative data repository.
- Linking **IndiaChain** with Aadhar, thus creating a secure personal identity for all Indians.
- Proper regulations for the use of blockchain technology in the country.
- Identifying and resolving key issues and challenges in implementing this technology, the prime amongst those being data privacy.
- India should effectively channel its technical human capital surplus to position itself as one of the pioneers during this upcoming wave of innovation.

“Artificial intelligence is rising to change every industry, but we have to understand its limits”. In the backdrop of the statement, discuss the benefits and disputes related with AI in Indian context. (250 words)

Reference: [Live Mint](https://www.livemint.com)

Why this question:

The article deals with the myths and realities associated with artificial intelligence, thus the context of the question.

Key demand of the question:

The answer must discuss the possible advantages and limitations that AI comes with and what way our country should tackle it.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define AI and its contributions in general.

Body:

Explain that Artificial intelligence (AI) is competent to have a revolutionary impact on businesses and consumers globally.

List down the advantages of AI in detail.

Discuss the concerns associated with AI such as – job losses, robot bosses, human errors, high cost, ethical issues etc.

Conclusion:

Conclude with what needs to be done.

**Introduction:**

Artificial intelligence (AI) is the branch of computer science concerned with making computers behave like humans. AI refers to the ability of machines to perform cognitive tasks like thinking, perceiving, learning, problem solving and decision

Artificial Intelligence (AI) brings in a host of real-world applications which had earlier merely been a subject of science fiction novels or movies. The breakthroughs such as the Weather Company's to be launched, **the GRAF model** capable of predicting a thunderstorm virtually anywhere on the planet every hour and other such applications are useful. AI has made inroads to automation and decision support systems to complement or augment human abilities.

Body:**AI is being widely used today as shown below**

- AI enhances the ability of computer systems to learn from their experiences over time, makes them capable of reasoning, perceiving relationships and analogies, helps solve problems, as well as respond in natural languages and adapt to new conditions.
- AI allows machines to sense and comprehend their surroundings and act according to their own intelligence or learning.
- **Governance:**
 - As India is poised for reforms in governance, AI can actually help with process optimization and cost savings for the government, in addition to solving some strategic problems or assisting in decision making.
- **Economy:**
 - Economic growth is vital for development, and the next generation of economic growth is anticipated to be fueled by technologies relating to big data, block chain, quantum computing and AI. These game changing technologies will spur innovation, create value for the investors, generate specialized job domains and as a result, propel economic growth.
 - Issues such as tax evasion, money laundering etc can be easily addressed using AI.
 - 68% of Indian business decision-makers believe AI will help their business in various ways such as boosting productivity, generating growth and addressing societal issues
 - India has one of the world's largest automotive industries, with a significant production and consumption base. AI applications have vast scope in the automotive sector, ranging from enhancing fuel efficiency to passenger safety to the concept of self-driving vehicles.
- **Healthcare:**
 - Healthcare sector in India is burgeoning with innovation and demand, having business models unique to the Indian requirements and spending power.
 - AI can augment the potential of government and private sector to deliver healthcare services and products with improved drug safety, better diagnosis and analysis of clinical reports for preventive and accurate treatment.
- **Defence:**
 - More advanced applications of AI extend to the domains of foreign, defence and security policies. Deep learning in AI can unravel futuristic functions by augmenting decision making ability of the humans with access to the information derived from large data sets.
- **Security:**

- AI has many peace time applications as well. It can be used to train soldiers and pilots, simulate war-game, synthesize information from surveillance systems and address critical problems in optimizing logistics, fleet management and maintenance
- Vision and Voice systems to interpret and comprehend visual inputs such as images, clinical diagnosis and facial recognition or voice inputs to recognize the source of the sound.
- Law enforcement or internal security requirements for detecting and recognizing individuals or criminals, with multitudes of data streaming from police databases or the network of surveillance cameras.
- Banking and financial services for fraud detection using advanced algorithms to identify patterns in transactions and consumer behaviours which are risk prone.
- AI is also helping insurance providers arrive at better risk assessment.
- Countries such as India can benefit a lot from the use of AI by focusing on sectors such agriculture, manufacturing, infrastructure etc.

Concerns and Risks:

- Lack of broad based expertise in research and application of AI.
- Absence of enabling data ecosystems –access to intelligent data.
- Data usage without consent, data selection bias and the resulting discrimination of AI models.
- High resource cost and low awareness for adoption of AI.
- Privacy and security, including a lack of formal regulations around anonymisation of data.
- Absence of collaborative approach to adoption and application of AI.
- Challenges remain in respect of applying stringent and narrowly focused patent laws to AI applications
- Indian technical universities are not doing enough to strengthen the AI ecosystem unlike their global counterparts.

Way forward:

- AI research in India is still in its infancy and requires largescale concerted and collaborative interventions.
- Skilling and reskilling of workforce forms an integral part of adopting AI.
- Adoption of decentralized teaching mechanisms, working in collaboration with the private sector and educational institutions.
- Adoption of AI across the value chain viz. startups, private sector, PSUs and government entities, will truly unlock the potential by creating a virtuous cycle of supply and demand.
- Data is one of the primary drivers of AI solutions, and thus appropriate handling of data, ensuring privacy and security is of prime importance.
- Establishing data protection frameworks and adoption of international standards.
- In order for India to ride the AI innovation wave, a robust intellectual property framework is required.

Conclusion:

“The greatest enemy of knowledge is not ignorance; it is the illusion of knowledge” was what **Stephen Hawking** said. The transformative capability of AI in India is huge, and must be rooted in an egalitarian ethical basis. Any institutional framework for AI should have a multidisciplinary and multi-stakeholder approach, and have an explicit focus on the ethical basis.

Conservation, environmental pollution and degradation, environmental impact assessment

Discuss the causes and concerns over red snow in Antarctica. (250 words)

Reference: [Indian Express](#)

Why this question:

The article captures the formation of Red snow in the Antarctica and the concerns posed by it.

Key demand of the question:

The answer must discuss in detail the causes and concerns posed by the 'Red snow' in the Antarctica.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain "Red snow"; it is a phenomenon that has been known since ancient times.

Body:

Explain the basic features of it; It is the algae that give the snow its red tinge. This alga species, *Chlamydomonas Chlamydomonas nivalis*, exists in snow in the polar and glacial regions, and carries a red pigment to keep itself warm. Discuss briefly the history and the discovery of red snow. Explain the causative factors responsible for the formation of the Red snow. Discuss the impact of it on the climate of the world and more so specifically upon the Antarctica. Elaborate on why it is a cause of concern.

Conclusion:

Conclude with solutions to address the issue and way forward.

Introduction:

"Red snow" or "watermelon" is a phenomenon that has been known since ancient times. Now, it raises concerns about climate change. For a few weeks now, snow around Ukraine's Vernadsky Research Base, located off the coast of Antarctica's northernmost peninsula has turned red. The snow is red because of a red-pigmented, microscopic algae called **Chlamydomonas nivalis chlamydomonas**, which thrives in freezing water as the ice melts.

Body:

Causes:

- Earlier this month, Antarctica experienced record high temperatures, causing the southernmost continent's ice caps to melt at an unprecedented rate.
- As a result, Eagle Island, a small island off Antarctica's northwest tip, experienced peak melt; brown rock appeared from beneath the ice and several ponds of melt water accumulated at the center.
- And with these unprecedented temperatures, the algae that normally thrive in freezing water and lie dormant across the continent's snow and ice are now in full bloom and cover the Antarctic Peninsula with blood-red, flower-like spores.
- The alga species, **Chlamydomonas nivalis chlamydomonas**, exists in snow in the polar and glacial regions, and carries a red pigment to keep itself warm.
- As per a report of 2016 in New York Times, algae found around the Ukrainian research base grow well in freezing temperatures and liquid water.
- During the summer times these typically green algae produces a natural sunscreen. This sunscreen colors the snow in shades of red and pink.

- It doesn't turn red until the weather warms up.
- The cell's carotenoids—the same pigment that gives pumpkins and carrots their orange hue—absorb heat and protect the algae from ultraviolet light, almost like sunscreen.

Concerns:

- The red snow causes the surrounding ice to melt faster, a 2017 study from Alaska Pacific University said.
- The more the algae packed together, the redder the snow.
- And the darker the tinge, the more the heat absorbed by the snow. Subsequently, the glaciers and ice sheets will melt with global warming faster.
- While the melt is good for the microbes that need the liquid water to survive and thrive, it's bad for glaciers that are already melting from a myriad of other causes, the study said.
- These algae change the snow's albedo — which refers to the amount of light or radiation the snow surface is able to reflect back.
- Changes in albedo lead to more melting. In the melting of snow in the Arctic, the key drivers have been snow and ice albedo, according to a 2016 study in the journal Nature.

Conclusion:

As human interventions are increasing, climate and ecosystems are changing and having adverse effects. Some extreme algal blooms have appeared in the oceans of the world. These have different features and mostly have adverse effects hampering the climatic conditions. The melting of the snow and glaciers is not a good indication as it affects the heat balance of the earth in turn triggering the butterfly effect.

*Extra information: In **Spain's Tossa de Mar**, for example, **sea foam** invaded the coastal town's beaches after a large storm brought strong winds and waves. Along the **coast of the East China Sea and Taiwan's Matsu Islands**, **toxic bioluminescent algae** called **dinoflagellates** light up the ocean surface with a bright blue glow. And a **rust-colored kind of alga**, **Karenia brevis**, blooms along the **Florida coast** and releases a toxin that targets fishes' central nervous system.*

Recent activities in Climate change and geopolitics meet to yield locust swarms that could disturb the productivity of Indian crops. Examine. (250 words)

Reference: [Live mint](#)

Why this question:

Reuters suggest that while locust swarms continue to plague African countries, for now, the outbreak has tapered down in India with swarms headed back towards Sindh and Baluchistan. Thus the question.

Key demand of the question:

The answer must discuss the issues and concerns posed by the spread of locust swarms and the interlinkages with climate change and the changing geopolitics.

Directive:

Examine – When asked to 'Examine', we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Briefly explain what the problem of locust swarms is.

Body:

Explain first the impact of changing climate and geopolitics. Discuss the issues of locust swarms; explain how it has been impacting the productivity of crops in general. Present the case of it in India. Take cues from the article and explain the need to recognise the issue and address it.

Conclusion:

Conclude by suggesting way forward.

Introduction:

Locusts are a group of short-horned grasshoppers that multiply in numbers as they migrate long distances in destructive swarms (up to 150km in one day). In recent weeks, locust swarms have attacked crops in more than a dozen countries in Asia and Africa.

Body:

Locusts:

- They are a collection of certain species of short-horned grasshoppers in the family Acrididae that have a swarming phase.
- These insects are usually solitary, but under certain circumstances they become more abundant and change their behaviour and habits, becoming gregarious.
- No taxonomic distinction is made between locust and grasshopper species; the basis for the definition is whether a species forms swarms under intermittently suitable conditions.
- These grasshoppers are innocuous, their numbers are low, and they do not pose a major economic threat to agriculture.
- However, under suitable conditions of drought followed by rapid vegetation growth, serotonin in their brains triggers a dramatic set of changes: they start to breed abundantly, becoming gregarious and nomadic (loosely described as migratory) when their populations become dense enough.
- They form bands of wingless nymphs which later become swarms of winged adults. Both the bands and the swarms move around and rapidly strip fields and cause damage to crops.
- The adults are powerful fliers; they can travel great distances, consuming most of the green vegetation wherever the swarm settles

Relationship between locusts and climate change:

- During quiet periods—known as recessions—desert locusts are usually restricted to the semi-arid and arid deserts of Africa, the Near East and South-West Asia that receive less than 200 mm of rain annually.
- In normal conditions, locust numbers decrease either by natural mortality or through migration.
- However, the last five years have been hotter than any other since the industrial revolution and since 2009.
- Studies have linked a hotter climate to more damaging locust swarms, leaving Africa disproportionately affected—20 of the fastest warming countries globally are in Africa.
- Wet weather also favours multiplication of locusts. Widespread, above average rain that pounded the Horn of Africa from October to December 2019 were up to 400 per cent above normal rainfall amount.
- These abnormal rains were caused by the Indian Ocean dipole, a phenomenon accentuated by climate change.

Measures to control locusts:

- Controlling desert locust swarms primarily uses organophosphate chemicals by vehicle-mounted and aerial sprayers, and to a lesser extent by knapsack and hand-held sprayers.
- Extensive research is ongoing regarding biological control and other means of non-chemical control with the current focus on pathogens and insect growth regulators. Control by natural predators and parasites so far is limited since locusts can quickly move away from most natural enemies.
- While people and birds often eat locusts, this is not enough to significantly reduce population levels over large areas.

Way forward to deal with climate change:

- While climate change is a global phenomenon, Africa stands out for its vulnerability which is driven primarily by the prevailing low levels of socioeconomic development. Persons living in poverty face compounding vulnerabilities to climate change impacts because they lack the resources to quickly recover from its effects.
- In this case, desert locusts are ravaging crops in the field before harvesting, wiping out livestock and wildlife feed, and with them savings, assets and livelihoods.
- Deployment of climate action solutions such as decentralizing solar dryers to agro-value chain actors can ensure that they can earn up to 30 times more by being able to preserve their harvest and sell during the offseason or gives them flexibility to compensate for unpredictable events such as these locust swarms.
- It can also create enterprise opportunities for auxiliary value chains of fabricating these solar dryers. Interventions like this are critical to increase climate resilience for some of the most vulnerable communities across the continent.

What is Black Carbon? Explain the impact of recently witnessed black carbon spikes in the Himalayan glaciers. (250 words)

Reference: [The Hindu](#)

Why this question:

According to a research done by the Wadia Institute of Himalayan Geology, the concentration of black carbon on Gangotri glacier has almost doubled in the past few years primarily because of agricultural burning and forest fires.

Key demand of the question:

The question is based on the concept of Black carbon and the impact of black carbon spikes that were recently witnessed in the Himalayan glaciers.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Define what Black carbon is. Black carbon is a kind of an aerosol. An aerosol is a suspension of fine solid particles or liquid droplets in the air.

Body:

Discuss about Black carbon, its basic features. Among aerosols (such as brown carbon, sulphates), Black Carbon (BC) has been recognized as the second most important anthropogenic agent for climate change and the primary marker to understand the adverse effects caused by air pollution. It gets emitted from gas and diesel engines, coal-fired power plants, and other sources that burn fossil fuel. It comprises a significant portion of particulate matter or PM, which is an air pollutant. Discuss

the impact of the recent black carbon spikes in the Himalayan glaciers. Explain what needs to be done.

Conclusion:

The Black Carbon (BC) aerosols contribute significantly towards global warming due to its light-absorbing nature. Their presence in the eco-sensitive zone, such as the Himalayan glacier valleys, is a matter of serious concern and needs to be meticulously monitored.

Introduction:

Black carbon is a potent climate-warming component of particulate matter formed by the incomplete combustion of fossil fuels, wood and other fuels. Black carbon is a short-lived climate pollutant with a lifetime of only days to weeks after release in the atmosphere. During this short period of time, black carbon can have significant direct and indirect impacts on the climate, glacial regions, agriculture and human health.

Black carbon concentrations near the Gangotri glacier rose 400 times in summer due to forest fires and stubble burning from agricultural waste, and triggered glacial melt, says a study by scientists at the Wadia Institute of Himalayan Geology (WIHG).

Body:

Black Carbon is produced both naturally and by human activities as a result of the incomplete combustion of fossil fuels, biofuels, and biomass. Primary sources include emissions from diesel engines, cook stoves, wood burning and forest fires. **India is the second largest emitter of black carbon in the world**, with emissions expected to increase dramatically in the coming decades, says an April 2019 study in the journal Atmospheric Research, with the Indo Gangetic plains said to be the largest contributor.

Key findings:

- Black carbon concentrations near the Gangotri glacier rose 400 times in summer due to forest fires and stubble burning from agricultural waste, and triggered glacial melt.
- The monthly mean concentration of EBC (equivalent black carbon) was found to be minimum in August and maximum in the month of May. The observed seasonal mean concentrations of EBC indicated a pristine glacial source and an absence of EBC sources in the locality.
- The concentration varied from a minimum of 0.01µg/cubic metre in winter to 4.62µg/cubic metre during summer.
- Being a pristine zone far from sources of pollution, the measurements are critical to establishing a baseline for pollution loads and estimating the contribution of various sources to pollution.

The impact of black carbon spikes in the Himalayan glaciers:

- The fine particles absorb light and about a million times more energy than carbon dioxide.
- It is said to be the second largest contributor to climate change after CO₂. But unlike CO₂, which can stay in the atmosphere for years together, black carbon is short-lived and remains in the atmosphere only for days to weeks before it descends as rain or snow.
- Black carbon absorbs solar energy and warms the atmosphere. When it falls to earth with precipitation, it darkens the surface of snow and ice, reducing their albedo (the reflecting power of a surface), warming the snow, and hastening melting.
- India is the second largest emitter of black carbon in the world, with emissions expected to increase dramatically in the coming decades, says an April 2019 study in the journal Atmospheric Research, with the Indo Gangetic plains said to be the largest contributor.

Impact of Human health:

- Concentration of black carbon particles was highest in the placentas of women who are most exposed to airborne pollutants in their daily life.
- Inhalation of these particles by the mother gets translocated from the mothers' lungs to the placenta, resulting in life-long changes to the development of the baby along with permanently damaging the lung tissues.
- The link between exposure to dirty air and increased cases of miscarriages, premature births, and low birth weights which in turn increases the chances for diabetes, asthma, stroke, heart disease and a lot of other conditions, has been established in this study.

Impacts on vegetation and ecosystems:

- Black carbon can affect the health of ecosystems in several ways: by depositing on plant leaves and increasing their temperature, dimming sunlight that reaches the earth, and modifying rainfall patterns.
- Changing rain patterns can have far-reaching consequences for both ecosystems and human livelihoods, for example by disrupting monsoons, which are critical for agriculture in large parts of Asia and Africa.

Way forward:

- **HOUSEHOLD ENERGY**
 - Replace traditional cooking to clean burning modern fuel cookstoves
 - Replace traditional cooking and heating with clean-burning biomass stoves

- Eliminate kerosene lamps
- Replace lump coal with coal briquettes for cooking and heating
- Replace wood stove and burners with pellet stoves and boilers
- **INDUSTRIAL PRODUCTION**
 - Modernize traditional brick kilns to vertical shaft brick kilns
 - Modernize coke ovens to recovery ovens
- Use diesel particular filters for road and off-road vehicles
- **TRANSPORT**
 - Fast transition to Euro VI/6 vehicles and soot-free buses and trucks
 - Eliminate high-emitting diesel vehicles
- **AGRICULTURE**
 - Ban open-field burning of agricultural waste
- **FOSSIL FUELS**
 - Capture and improve oil flaring and gas production
- **WASTE MANAGEMENT**
 - Ban open burning of municipal waste

Discuss the rising threat and impact of coral bleaching on coral reefs of the World. (250 words)

Reference: [Indian Express](#), [UN.ORG](#)

Why this question:

The article presents a picture of rising threat and impact of coral bleaching on coral reefs of the World. Scientists have warned that **the Great Barrier Reef** will face a critical period of heat stress over the coming weeks; following the most widespread coral bleaching the natural world has ever endured.

Key demand of the question:

The answer must discuss the effect of coral bleaching on the coral reefs of the world.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly define what corals are, what coral bleaching is.

Body:

Coral reefs are important hotspots of biodiversity in the ocean. Corals are animals in the same class (Cnidarian) as jellyfish and anemones. They consist of individual polyps that get together and build reefs. Discuss the significance of coral reefs first. Explain then the threats that they are possibly facing. Discuss the factors responsible for Coral Bleaching. Highlight the consequences of it on the ecology of coral reefs around the world. Suggest what needs to be done to overcome the challenge.

Conclusion:

Conclude with way forward.

Introduction

A coral reef is an underwater ecosystem characterized by reef-building corals. Reefs are formed of colonies of coral polyps held together by calcium carbonate. Most coral reefs are built

from stony corals, whose polyps cluster in groups. Most reefs grow best in warm, shallow, clear, sunny water.

They occupy less than **0.1% of the world's ocean** area, yet they provide a home for at least **25%** of all marine species. Hence they are also known as “**rainforests of the ocean**”.

Coral Bleaching: When corals are stressed by changes in conditions such as temperature, light, or nutrients, they expel the symbiotic algae living in their tissues, causing them to turn **completely white**.

Body

Coral Bleaching

Rising threat of bleaching to Coral Reefs

Coral reef bleaching is caused by various anthropogenic and natural variations in the reef environment including sea temperature, solar irradiance, sedimentation, xenobiotics, subaerial exposure, inorganic nutrients, freshwater dilution, and epizootics. Coral bleaching events have been increasing in both frequency and extent worldwide in the past 20 years. Global climate change may play a role in the increase in coral bleaching events, and could cause the destruction of major reef tracts and the extinction of many coral species.

Natural Causes

- **Climate Change**
 - **Rising Sea surface temperature:** The main cause of coral bleaching is heat stress resulting from high sea temperatures. Temperature increases of only one degree Celsius for only four weeks can trigger bleaching events.

- If these temperatures persist for longer periods (eight weeks or more) corals begin to die.
- **El-Nino:** Frequency of storms such as those associated with **El Niño Southern Oscillation** events has resulted in the devastation of very large areas of coral. In fact, 16% of the world's corals were affected by the 1997-1998 El-Nino event.
- **Increased solar irradiance:** Bleaching during the summer months, during seasonal temperature and irradiance maxima often occurs disproportionately in shallow-living corals and on the exposed summits of colonies. Solar radiation has been suspected to play a role in coral bleaching. Both photosynthetically active radiation (PAR, 400-700nm) and ultraviolet radiation (UVR, 280-400nm) have been implicated in bleaching.
- **Freshwater inundation:** Strong cyclones and storms causes heavy precipitation and strongly dilutes the ocean water near the shore. This can disrupt Saline content (ppm) of the shallow water coral and induces bleaching.
- **Subaerial exposure:** Sudden exposure of reef flat corals to the atmosphere during events such as extreme low tides, ENSO-related sea level drops or tectonic uplift can potentially induce bleaching. The consequent exposure to high or low temperatures, increased solar radiation, desiccation, and sea water dilution by heavy rains could all play a role in zooxanthellae loss, but could also very well lead to coral death.
- **Cold-Stress Event:** In January 2010, cold water temperatures in the Florida Keys caused a coral bleaching event that resulted in some coral death.
- **Epizootics:** Pathogen induced bleaching is different from other sorts of bleaching. Most coral diseases cause patchy or whole colony death and sloughing of soft tissues, resulting in a white skeleton (not to be confused with bleached corals). A few pathogens have been identified the cause translucent white tissues, a protozoan.

Anthropogenic activities

- **Increasing Green House Gas Emissions**
- **CO2 Emissions:** Rising Emission intensity from fossil fuels, coal and factories are heating up the planet and increasing carbon fertilization in oceans. Harmful Algal Blooms leads to turbidity of water, thereby causing bleaching.
- **Pollutant Runoff:** **Pollutants** from river water and industrial affluent leads to bleaching.
- **Poor Quality water:** This can occur due to toxic sediment that comes along with the water that joins the sea. Corals cannot withstand toxicity and thus expel the algae.

Impact of Coral Bleaching on Coral Reefs

Corals begin to starve once they bleach. While some corals are able to feed themselves, most corals struggle to survive without their zooxanthellae. If conditions return to normal, corals can regain their zooxanthellae, return to their normal colour and survive. However, this stress is likely to cause decreased coral growth and reproduction, and increased susceptibility to disease.

- **Great Barrier Reef:** Over 2016 and 2017, Great Barrier Reef suffered back-to-back bleaching, leaving half of the shallow water corals dead. **One-third of the 3,863** reefs that make up the Great Barrier Reef went through a catastrophic die-off.
- **Biodiversity of Ocean Ecosystem** These sessile organisms also provide refuge and shelter for many mobile animals. The entire biodiversity sustaining on the coral reef will be affected.

- **Fish Species:** 25% of fish species spend some part of their life cycle in reefs, despite the fact that they cover less than 1% of ocean floor.
- **Carbon sink:** In addition, sessile algae and the coral–algal symbiosis determine carbon fixation and its pathways into organic and inorganic forms. These are the basis for the energy that supports the ecosystem and deposits the calcium carbonate skeletons that create the reef.
- **Loss of livelihoods:** Countries in Southeast Asia such as Indonesia, Thailand and Philippines would bear the brunt of the damage, as it will reduce the fish stock rapidly.
- **Economic Impact:** Both fishing and tourism will be hit hard. Many communities in Queensland had to look for alternate livelihoods due to coral bleaching and loss of ocean ecosystem.
- **Barrier to storm:** Coral reefs act as key barrier to guard against incoming storms and mitigate the damage done by surging seas.

Conclusion

If a global warming trend impacts on shallow tropical and subtropical seas, we may expect an increase in the frequency, severity and scale of coral reef bleaching. Coral mortality could exceed 95% regionally with species extirpation and extinctions. A conservative temperature increase of 1-2 degrees C would cause regions between 20-30 degrees N to experience sustained warming that falls within the lethal limits of most reef-building coral species. In conjunction with sea temperature rise would be a sea level rise, and it has been suggested that sea level rise would suppress coral growth or kill many corals through drowning or lower light levels.

Even if significant sea warming and elevated irradiance levels do not occur, coral reef degradation from anthropogenic pollution and overexploitation will still continue, a result of unrelenting human population growth.

“Water and climate change”, explain how the two are inextricably linked? Illustrate with examples. (250 words)

Reference: [WorldWaterDay.org](https://www.worldwaterday.org)

Why this question:

March 22 (Sunday) was World Water Day. Thus the context of the question.

Key demand of the question:

The question aims to discuss the inextricable linkages between water and climate change, one must explain it using suitable illustrations.

Directive:

Illustrate – A similar instruction to ‘explain’ whereby you are asked to show the workings of something, making use of definite examples and statistics if appropriate to add weight to your explanation.

Structure of the answer:

Introduction:

Briefly highlight the significance of water in general to the entire world.

Body:

Climate delay is almost as dangerous as climate denial. Every country in the world must work more quickly. Extreme weather events are making water scarcer, more unpredictable, more polluted or all three. Humans need water to survive, as do all the systems we rely on: sanitation, healthcare, education, business and industry.

Explain then, how Water can help fight climate change.

Discuss how and why Climate policy makers must put water at the heart of action plans.

Present the case of health outbreak and discuss how water plays a key role in it.

Conclusion:

Conclude with way forward.

Introduction:

Climate change impacts the world's water in complex ways. Climate change manifests itself primarily through changes in the water cycle. As climate changes, droughts, floods, melting glaciers, sea-level rise and storms intensify or alter, often with severe consequences. Climate change impacts have direct consequences for water security and conflict.

Body:

The 2020 edition of the World Water Development Report (WWDR 2020) entitled 'Water and Climate Change' aims at helping the water community to tackle the challenges of climate change and informing the climate change community about the opportunities that improved water management offers in terms of adaptation and mitigation.

Interlink between climate change and water:

- The ever increasing dependence on ground water and its continuous excessive exploitation is reducing the ground water level and adversely affecting the quality of drinking water supply, which is a complex challenge.
- Drying of water sources, rapid depletion of ground water table, recurrence of drought and deteriorating water management in different states are presenting different types of challenges.
- Repairs of closed bore pumps, water supply pipelines are not being done on time due to which there is a special crisis in the area.
- Due to the pressure of industrialization and urbanization, the sources of water have been destroyed. This worrying aspect was consistently ignored by various governments.

- Fluoride, nitrate, pesticides, etc. were found to be present in more than acceptable limits in the ground water of most cities and about 19,000 villages. Water quality is challenging in this regard.
- Studies sponsored by the World Bank and UNICEF show that not only is drinking water inadequate in rural India but its imbalance is widespread across the country.
- Waterborne diseases are the biggest health challenge in India. According to official statistics published in the National Health Profile of India-2018, about one quarter or four cases reported in India are due to communicable diseases and one in every five deaths is due to waterborne diseases.
- Water crisis has become a major problem in 30 countries of the world and in the next decade about two-thirds of the global population will face extreme water shortage. In real terms water crisis has become a major challenge in India.

Measures needed:

- **Water efficiency:**
 - Incentivize the wider adoption of sprinkler and drip irrigation by diverting resources otherwise used to subsidize power and surface irrigation.
 - Special emphasis should be laid on desilting of water bodies, including river, lakes, ponds and reservoirs.
- **Recycle of waste water:**
 - With the country generating 140 bcm of wastewater annually, a pilot scheme to irrigate 10 lakh ha with treated waste water by 2020 may initially be taken up.
 - Industries should be encouraged to meet a major share of their demand through recycled water. Besides, programmes for smart water meters and tradable permits for use of recycled water may be launched.
- **Water harvesting**
 - **Watershed development:**
 - The MoWR may develop specific strategies to tap water through watershed development (check dams) in rain-fed areas, expand micro irrigation coverage to 80 lakh ha, and link ground water development to aquifer mapping.
 - The timeline for watershed development projects needs to be shortened from seven to four years with special efforts by state governments. Funds available under MGNREGA and state plans may be used for watershed development projects.
 - **Rainwater harvesting:**
 - Model Building Bye Laws, 2016 circulated by Ministry of Urban Development includes the provision of rain water harvesting.
 - Barring the states/UTs of Manipur, Sikkim, Mizoram and Lakshadweep, all states have incorporated the provision in their respective Building Bye Laws.
- **Groundwater management:**
 - As on date, development of groundwater, i.e., utilization of groundwater resources vis-à-vis replenishable quantity, is 62 per cent. There is a need to develop recharging zones

at identified places to make groundwater resources sustainable using check dam, farm ponds, tanks and injection wells.

- Special focus should be placed on the quality of rural drinking water supply in arsenic and fluoride affected areas by tapping multiple sources through conjunctive use of surface water, ground water and rain water harvesting. All new, piped water supply schemes should have mandatory provisions on operation and maintenance involving local communities and stakeholders.

Way forward:

- To mitigate conflicts and achieve equitable distribution of water, an integrated river basin management approach needs to be adopted. The setting up of river basin organisations for major basins may be expedited.
- NITI Aayog has developed a concept note on Revitalization of Rivers, which may be implemented on a pilot basis before being expanded across major states.
- To ensure Aviral and Nirmal Dhara in the Ganga, the river should be managed as a single system.
- There is need for a scheme on medium term measures for flood management. This should include completion of incomplete works in the states of Assam, Bihar, Uttar Pradesh, Uttarakhand and West Bengal.
- A water regulatory framework should be established for water resources in all states.
- An action plan should be drawn up to improve water use efficiency (with 2017 as the base year) by 20 per cent in all sectors by 2022.
- The composite water management index developed by NITI Aayog may be used as a potent tool to assess and further improve the efficiency of water resources management.

What is Earth Hour? Why is Earth Hour the event held in late March? Elaborate on its significance. (250 words)

Reference: [News On Air](#)

Why this question:

Earth Hour 2020 was held on March 28, from 8:30 pm to 9:30 pm. Thus the question.

Key demand of the question:

Explain what Earth hour is and its significance in detail.

Directive:

Elaborate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly define Earth hour.

Body:

Discuss the following aspects in your answer:

What is Earth Hour? Earth Hour is a global grassroots movement uniting people to take action on environmental issues and protect the planet.

Organized by: World Wide Fund for Nature (WWF).

Background: Earth Hour was started as a lights out event in Sydney, Australia in 2007.

When does Earth Hour take place? The annual Earth Hour lights out event is held worldwide toward the end of March to encourage individuals, households, communities and businesses to turn off their non-essential lights for one hour as a symbol for their commitment to the planet. Why is Earth Hour the event held in late March? The second-to-last and last weekend of March is around the time of the

Spring and Autumn equinoxes in the northern and southern hemispheres respectively, which allows for near coincidental sunset times in both hemispheres, thereby ensuring the greatest visual impact for a global 'lights out' event.

Earth Hour logo: Earlier it was 60 (60 symbolizes 60 minutes). But since 2011 it is 60+. Here + represents the commitment to go beyond the earth hour (i.e. switching off non – essential lights in day to day life).

Conclusion:

Conclude with importance.

Introduction:

Earth Hour is an annual event organized by the World Wildlife Fund that promotes conservation and sustainable energy, dating back to 2007. During this time, civilians are encouraged to switch off their lights for one hour to help reduce the effect of global warming and raise awareness for climate change and wildlife conservation. Every year, Earth Hour is observed on the last Saturday of March at 8:30 pm. And while previously it brought the public out onto the roads to mark the hour, this year the famous environmental initiative went digital as many countries are in lockdown.

Body:

Reasons for holding it in late march:

- It is held every year on the last Saturday of March.
- It encourages people from more than 180 countries to switch off the lights from 8.30 pm to 9.30 pm as per their local time.
- The idea is to refrain from the use of non-essential lighting to save energy in a symbolic call for environmental protection.
- Earth Hour has become a catalyst for positive environmental impact, driving major legislative changes by harnessing the power of the people and collective action.

Significance of Earth hour:

- Global warming and climate change have dominated the scientific discourse in the past more than one decade. With ever rising population of the world, the climate change has put the humankind at a great risk along with other species.
- Global warming, rising levels of pollution due to ever increasing industrialization, declining forest cover and rising sea levels are some of the dangers that drastically affect the workings of life on the earth.
- Though the largest polluters are big industries, the WWF tries to make the masses more and more aware about the impending dangers of adverse climate so that they could put pressure on the respective governments to frame environment-friendly policies and laws.
- With Earth Hour, the WWF aims to engage people across the globe to adopt more sustainable lifestyle. Turning off lights for an hour is just an annual reminder that if the world does not mend its ways, it will be heading to a dark age, literally.

Impacts of Earth hour:

- It helped create a 3.5 million hectare marine-protected area in Argentina.
- Ban all plastics in the Galapagos in 2014.
- Plant 17 million trees in Kazakhstan, light up homes with solar power in India and the Philippines.
- Push new legislation for the protection of seas and forests in Russia.

Conclusion:

It was famously started as a lights-off event in Sydney, Australia in 2007. Since then it has grown to engage more than 7000 cities and towns worldwide. Today, Earth Hour engages a massive mainstream community on a broad range of environmental issues. The one-hour event continues to remain the key driver of the now larger movement.

The recently witnessed low AQI across the country proves that pollution is mostly anthropomorphic (man-made) in nature. Comment.(250 words)

Reference: [The Hindu](#)

Why this question:

The nationwide lockdown in place has led to reduced air pollution in over 90 cities in India. Thus the question.

Key demand of the question:

Explain the way Air pollution across the cities has come down, discuss the need to have focused measures to replicate such a situation using technology that can ensure good AQI.

Directive:

Comment– here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

Briefly talk about the worrying air pollution conditions in the country in the past.

Body:

To start with, talk about the air pollution causes.

Discuss PM2.5- its impact, and other harmful gases that are polluting air.

The biggest impact of particulate air pollution on public health is understood to be from long-term exposure to PM2.5, which increases the age-specific mortality risk, particularly from cardiovascular causes. Exposure to high concentrations of PM to even short term episodes can also intensify lung and heart conditions. Children, the elderly and those with predisposed respiratory and cardiovascular diseases, are known to be more susceptible to the health impacts from air pollution.

Discuss the effect on Air pollution levels amidst the COVID-19 control.

Suggest what measures should be taken in future.

Conclusion:

The low AQI prove that pollution is mostly anthropomorphic (man-made) in nature. Though the lockdown is not the ideal way to bring down air pollution, it proves that it can be done. Pollution can be reduced by using technology and low-emission alternatives.

Introduction:

India is currently under the biggest lockdown with around 130 crore people asked to stay home in view of the COVID-19 outbreak. With a nationwide lockdown in place, over 90 cities, including Delhi, recorded minimal air pollution in the last few days. The government has urged people to avoid unnecessary travel, significantly reducing the traffic movement across the country. Lockdown has reduced vehicular traffic across the country, leading to a drop in PM2.5, NOx levels.

Body:

Air Quality Index across country:

- According to the Centre-run System of Air Quality and Weather Forecasting and Research (SAFAR), the measures against COVID-19 have led to a drop in PM2.5 (fine particulate pollutant) by 30% in Delhi and by 15% in Ahmedabad and Pune, respectively.
- The level of Nitrogen Oxide (NOx) pollution, which can increase the risk of respiratory conditions, has also reduced. NOx pollution is mainly caused due to a high motor vehicle traffic.
- In Pune, NOx pollution has reduced by 43%, in Mumbai, by 38% and in Ahmedabad, by 50%.
- According to SAFAR, in March, pollution is in the “moderate” category (Air Quality Index range: 100-200) while currently, it is in the “satisfactory” (AQI 50-100) or “good” (AQI 0-50) category.
- According to the data of the Central Pollution Control Board (CPCB), the air quality in the national capital is presently in the “good” category. In Kanpur, which has high pollution levels, it is in the “satisfactory” category.
- Moreover, 92 other cities with CPCB monitoring centres have recorded minimal air pollution, with the air quality in the range of “good” to “satisfactory”.
- As many as 39 cities have recorded “good” air quality and 51 cities have recorded “satisfactory” air quality in the last few days, the CPCB data showed.

Reasons for good air quality index:

- It is the lockdown impact.
- Local factors like shutting down of industries and construction and traffic have contributed in improving the air quality.

- The world's largest lockdown means all factories, markets, shops, and places of worship are now closed, most public transport suspended and construction work halted, as India asks its citizens to stay home and practice social distancing.
- Rain is also helping, but the curbs on local emissions are playing a significant role.
- Carbon monoxide mainly from cars had been reduced by nearly 50% compared with last year.
- Emissions of the planet-heating gas CO₂ have also fallen sharply.

Measures needed:

- Increase public awareness of air pollution. Educate and inform people about what they can do to reduce air pollution. Put out public health messages on the metro, buses, billboards, and radio to help change public behaviour.
- Raise and enforce emission standards. India is still on Bharat III and IV emission standards for our vehicles and fuels. This is 10-15 years behind the West, where vehicles spew one-tenth of our emissions or less.
- Improve public transportation and traffic management. Expand the fleet of CNG buses. Implement BRT the right way. Build, repair, and reclaim the sidewalks for pedestrians – not for parking and vending – so people can walk more often, including to nearby bus stops and metro stations.
- Discourage vehicle use: Driving is not a right but a privilege; it has a social cost. Impose – as many countries do – an annual vehicle use fee. Penalize ownership of multiple cars in a household.
- Penalize big and non-compliant polluters. Like Beijing, ban the sale and registration of all new private diesel vehicles in Delhi. Provide 24x7 power across the NCR to minimize genset use; ban diesel gensets and promote CNG gensets. Spot-check fuel pumps for adulteration. Move coal-fired brick/pottery kilns out of the NCR.
- Reduce road and construction dust. The problem of dust plagues the entire Indo-Gangetic plain. It can be mitigated by changing how our urban surface infrastructure is built.
- Reduce domestic sources of pollution, improve waste management. According to the 2011 census, over ten percent of Delhi's households still use biomass for cooking. Remove the address proof requirement for LPG. Make LPG more affordable.

Conclusion:

Environmentalists believe that the reduced pollution levels should act as a wake-up call for the government. This has been a fantastic wake-up call and I think we had a reality check and we need to figure out a new normal. This is an opportunity, a chance to find a new sustainable life.

Disaster and disaster management.

Explain what constitutes a notified disaster. Discuss how the State Disaster Relief Fund is used by the government to handle such situations.(250 words)

Reference: [Indian Express](#)

Why this question:

The article explains in what way declaring COVID-19 a 'notified disaster' help tackle the situation.

Key demand of the question:

The answer must bring out the significance of what a notified disaster is and in what way the SDRF is used in such instances.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly define what a notified disaster is.

Body:

Discuss the following dimensions –

Who notifies a disaster? What defines a notified disaster?

A “notified disaster”, would enable it to provide assistance and spend more funds to fight the pandemic.

The MHA has “notified” the coronavirus incidence as a disaster. Natural disasters like floods are also similarly notified, but this is the first time for a pandemic, and officials could not recall when the provision was last invoked at national level for all states.

Discuss how the State Disaster Relief Fund is used by the government to handle such situations.

Conclusion:

Conclude with significance of such a move amidst such pandemics.

Introduction:

According to the **Disaster Management Act**, a disaster is defined as the following, “a catastrophe, mishap, calamity or grave occurrence in any area, arising from natural or man-made causes, or by accident or negligence which results in substantial loss of life or human suffering or damage to, and destruction of, property, or damage to, or degradation of, environment, and is of such a nature or magnitude as to be beyond the coping capacity of the community of the affected area”.

The Ministry of Home Affairs decided to treat COVID-19 as a **notified disaster** for the purpose of providing assistance under the State Disaster Response Fund (SDRF).

Body:

State Disaster Response fund (SDRF):

- The SDRF is constituted under the **Disaster Management Act, 2005** and is the **primary fund available with state governments for responses to notified disasters**.
- The Central government contributes 75 per cent towards the SDRF allocation for general category states and UTs, and over 90 per cent for special category states/UTs, which includes northeastern states, Sikkim, Himachal Pradesh and Uttarakhand).
- For SDRF, the Centre releases funds in two equal installments as per the **recommendation of the Finance Commission**.
- On the other hand, the **National Disaster Response Fund**, which is also constituted under the Disaster Management Act, 2005 supplements the SDRF of a state, in case of a disaster of severe nature, provided adequate funds are not available in the SDRF.
- The disasters covered under the SDRF include cyclones, droughts, tsunamis, hailstorms, landslides, avalanches and pest attacks among others.

Current Utilization of SDRF funds during such situations:

- In 2018, in view of the devastation caused by the Kerala floods, political leaders in Kerala demanded that the floods be declared a “national calamity”.
- As of now, there is no executive or legal provision to declare a national calamity.

- According to the MHA's notification, the items and norms of assistance under SDRF include a compensation of Rs 4 lakh per deceased, including those involved in relief work and for COVID-19 positive people requiring hospitalisation, the costs will be in accordance to rates fixed by the state governments.
- The Centre said that cost of hospitalization for managing COVID-19 patients would be at the rates fixed by the state governments.
- The state government can use SDRF fund for providing temporary accommodation, food, clothing and medical care for people affected and sheltered in quarantine camps, other than home quarantine, or for cluster containment operations.
- The cost of consumables for sample collection would be taken from the funds which can be used to support for checking, screening and contact tracing.
- Further, funds can also be withdrawn for setting up additional testing laboratories within the government set up.
- Further SDRF money can also be used for procuring thermal scanners and ventilation and other necessary equipment.

Conclusion:

The move would enable the states to spend a larger chunk of funds from the State Disaster Response Fund to fight the pandemic.

Do you agree that scientific advances are reducing technical barriers that earlier limited the potential of biological weapons? Discuss with suitable examples.(250 words)

Reference: [News On Air](#)

Why this question:

March 26 marked the 45th anniversary of the entry into force of the Biological Weapons Convention. The anniversary comes as the world is grappling with the Coronavirus pandemic. Thus the question.

Key demand of the question:

Explain the interrelationship between the growing technological advancement with that on the potential promotion of biological weapons.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly discuss what constitute Biological weapons.

Body:

Talk about the scientific advancements the world countries are making.

Then move onto discuss – The Biological Weapons Convention (BWC), which is a legally binding treaty that outlaws biological arms.

Discuss the nuances of biological weapons; the concerns associated and what needs to be done.

Conclusion:

Conclude that all countries should reaffirm their unequivocal rejection of the use of disease as a weapon with due international cooperation.

Introduction:

Biological weapon, also called **germ weapon**, any of a number of disease-producing agents—such as bacteria, viruses, rickettsiae, fungi, toxins, or other biological agents—that may be utilized as weapons against humans, animals, or plants. Biological weapons, like chemical weapons, radiological weapons, and nuclear weapons, are commonly referred to as weapons of mass destruction,

although the term is not truly appropriate in the case of biological armaments. Lethal biological weapons may be capable of causing mass deaths, but they are incapable of mass destruction of infrastructure, buildings, or equipment.

Body:

The UN chief, in his message on the 45th anniversary of the Biological Weapons Convention's entry into force, said that all countries should reaffirm their unequivocal rejection of the use of disease as a weapon.

The Biological Weapons Convention (BWC)

- It is the first multilateral disarmament treaty banning the development, production and stockpiling of an entire category of weapons of mass destruction, was opened for signature on 10 April 1972.
- The BWC entered into force on 26 March 1975.
- The BWC bans:
 - The development, stockpiling, acquisition, retention, and production of:
 - Biological agents and toxins “of types and in quantities that have no justification for prophylactic, protective or other peaceful purposes;”
 - Weapons, equipment, and delivery vehicles “designed to use such agents or toxins for hostile purposes or in armed conflict.”
- The transfer of or assistance with acquiring the agents, toxins, weapons, equipment, and delivery vehicles described above.

Scientific advances have led to Bioterrorism. It is a form of terrorism where there is the intentional release of biological agents (bacteria, viruses, or other germs). This is also referred to as germ warfare.

Impact of Bioterrorism:

- In effect, biological warfare is using non-human life to disrupt — or end — human life. Because living organisms can be unpredictable and incredibly resilient, biological weapons are difficult to control, potentially devastating on a global scale, and prohibited globally under numerous treaties.
- The threat of bioterrorism is increasing as a result of the rise of technical capabilities, the rapid expansion of the global biotechnology industry, and the growth of loosely sophisticated networks of transnational terrorist groups that have expressed interest in bioterrorism.

Challenges posed by bioweapons:

- The technology associated with the manufacture of biological weapons is relatively inexpensive, and because it is similar to that used in vaccine production facilities, it is easy to obtain.
- The microbial agents needed for most biological weapons are widely available.
- It is difficult to gauge the extent of biological weapons development in other nations since production facilities require little space and are not easy to identify.
- For instance, the acquisition and dissemination of even the most highly restricted organism, Variola major, is not an implausible scenario.

- There is growing concern that biological weapon designs or materials from this program might find their way to other nations or terrorist groups.
- Finally, the series of revelations following the Gulf War regarding the true capacity and scope of Iraq's biological weapons program has been alarming.
- In addition to creating many tons of pathogens and toxins, including B. anthracis and C. botulinum toxin, Iraq also admitted that it had loaded bombs and missiles with biological agents

Preparation to Respond to Biological Weapon Use:

- Existing prevention strategies are insufficient to guarantee that biological weapons will not be used. Furthermore, it is clear that biological weapons are proliferating.
- **Awareness and education:**
 - ID professionals are called on every day to diagnose and treat patients with fever, pneumonia, rash, and flulike symptoms; therefore, it is the ID professional who would be among the clinicians most likely to recognize the diseases caused by biological weapons.
 - Professional educational and training curricula should be enhanced so that ID professionals are better capable of recognizing the diseases that would follow use of a biological weapon such as anthrax, plague, or smallpox.
- **Laboratory diagnosis:**
 - Should the recognition of an unusual disease or pattern of illnesses prompt consideration of possible biological weapon use, members of the ID community will be called on to advise upon the most rapid procedures for diagnostic confirmation of disease.
 - In anticipation of this, ID experts should become familiar with the processes by which either the hospital laboratory or the local or state health department, in consultation with the Centers for Disease Control and Prevention (CDC) as necessary, will perform diagnostic studies to implicate or exclude biological weapons use.
- **Systems for distributing therapeutics:**
 - Should a biological weapon use be confirmed, treatment and intervention strategies for the ill and for the exposed but not yet ill will be critical. Depending on the disease, antibiotics, and/or vaccines or other therapies, as well as quarantine, could be lifesaving.
- **Scientific research:**
 - The ID community already does research that seeks new strategies for diagnosis, prevention, or treatment for infectious disease.
 - Commensurate with this, the ID community might elect to encourage and reward basic science research efforts that seek to produce novel diagnostic technologies, preventive, or therapeutic interventions for the diseases caused by biological weapons.

Challenges to internal security through communication networks, role of media and social networking sites in internal security challenges, basics of cyber security; money-laundering and its prevention.

Are Internet shutdowns healthy for India? Critically analyse and also comment on the recent trends associated and the laws governing it. (250 words)

Reference: [Indian Express](#)

Why this question:

Data on internet shutdowns in India which is available in public domain and compiled by Software Freedom Law Centre (SFLC). Thus the question.

Key demand of the question:

The answer must discuss about the study and its key findings; trends in internet shutdowns in India and comment upon the laws governing it.

Directive:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgment.

Structure of the answer:

Introduction:

Briefly start with the key findings of the report. The number of preventive internet shutdowns enforced by the central and the state governments in India saw a major spike between 2017 and 2019, and as many as 95 of these lasted for more than 24 hours.

Body:

First discuss the recent internet shutdowns played out in many parts of the country like – Kashmir, north-east etc. Then explain that in today's world, there are high social and economic costs for repeated and prolonged suspension of Internet connectivity. Explain the difference between Preventive and Reactive internet shutdown. Discuss rules regarding internet shutdown; Indian Telegraph Act of 1885. Highlight the Misuse of Section 144 of CrPC.

Conclusion:

Conclude by suggesting way forward.

Introduction:

The Software Freedom Law Center (SFLC), the global tracker for Internet shutdowns, was inundated with messages of shutdowns across the country — a frequently recurring phenomenon in India over the past several years. Recently as protests over a controversial citizenship law rage across India, authorities resorted to shutting down the internet in cities where demonstrators flooded the streets. **A country that is now seen as the internet shutdown capital of the world.** There were at least 147 instances over these three years for which there is no data on the duration of the shutdowns as there is lack of any form of communication on these blockades.

Body:

Recent internet shutdowns in India:

- **The Union Territory of Jammu and Kashmir, where the internet had remained suspended until March 4 for 213 days,** has seen since 2012 at least 60 instances of connectivity being snapped for more than 24 hours without any official order.

- **133 days:** An internet shutdown in Indian-administered Kashmir which lasted from 8 July to 19 November in 2016
- **99 days:** Authorities shut off the internet in India's West Bengal state from 18 June to 25 September in 2017
- Most internet shutdowns in India are ordered under **article 144 of the Indian Penal Code**, which empowers local authorities to issue prohibitory orders to deal with situations of potential unrest. (Software Freedom Law Center)
- The current sweeping shutdowns come after access to the Internet was cut off as a preventive measure in several states last month ahead of the Supreme Court's Ayodhya verdict, when there were apprehensions of tension and violence
- The Internet was suspended around the death anniversary of the slain Hizbul Mujahideen commander Burhan Wani, and on Independence Day 2017, Republic Day 2016, and Eid 2015.

Laws that govern internet shutdown:

- The Information Technology Act, 2000, the Criminal Procedure Code (CrPC), 1973 and the Telegraph Act, 1885 are the three laws that deal with suspension of Internet services.
- But before 2017, Internet suspension orders were issued under **section 144 of the CrPC**.
- A colonial era law, Section 144 gives a magistrate the powers to enforce a general shutdown of the area, if he or she believes that there could be violence in the area, arising from a certain tension between two or more groups of people.
- In 2017, the central government notified the **Temporary Suspension of Telecom Services (Public Emergency or Public Service) Rules under the Telegraph Act** to govern suspension of Internet. These Rules derive their powers from Section 5(2) of the Indian Telegraph Act, which talks about interception of messages in the "interests of the sovereignty and integrity of India".
- Despite the 2017 rules, the government has often used the broad powers under Section 144.
- Supreme Court recently delivered the verdict on a clutch of petitions challenging the Union government's decision to impose restrictions on the erstwhile state of Jammu and Kashmir after the August 5 revocation of provisions of Article 370.

- The Supreme Court said that all restrictive orders under Section 144 of CrPC and suspension of internet services in Jammu and Kashmir have to be reviewed by the administration within a week.

Issues and concerns involved:

- Shutdown is a violation of fundamental rights of Freedom of speech and expression.
- Internet shutdowns can erode democratic institutions and values. For example, if citizens are using the internet to mobilize themselves, then shutting down the internet is not different from suppressing dissent.
- Does a democratic government have the right to shut down the internet? Is a basic question regarding internet shutdown. After the Gujarat government suspended internet services for almost a week during the Patidar protest in 2015, the matter was taken to the courts.
- Internet shutdowns are not particularly effective—people always find other ways to communicate, and studies have shown that such censorship in times of political unrest actually leads to more violent uprisings as the information void fuels uncertainty and causes panic.
- The Internet is pretty much a basic human right, even if not legally defined as such, for most parts of the world — without access to the virtual world, a very large number of vital human activities simply stop.
- In countries that have “medium” Internet penetration — 49% to 79% of the population — a shutdown could dent daily economic activity by \$6.6 million per 10 million people, according to an analysis by Deloitte, quoted in The New York Times article.
- Between July 2015 to June 2016, Internet shutdowns caused global losses of more than \$2.4 billion, according to an analysis by The Brookings Institution quoted in the same article.
- Over the past five years, some 16,000 hours of Internet shutdowns cost the economy a little over \$3 billion, according to estimates in a report by the Indian Council for Research on International Economic Relations (ICRIER).
- Cutting off communication in itself is an enormous public safety risk. Citizens are left without access to information about emergency services like the volunteer-built solutions like chennairains.org.
- Because internet shutdowns affect every section of society - especially those who need it the most. And these restrictions, targeting the 'common people', are becoming increasingly 'common'.

Way forward:

- Perhaps the solution can be found in renegotiating our law enforcement approaches in keeping with the changing times and technologies.
- Police and government agencies could increase their presence online so that they can actively fight back against rumour-mongering.
- Empowering local law enforcement so they can tackle tensions without shutting the Internet down.
- The solution to internet misuse is to build stronger laws for data privacy and protection. Stopping access to internet services altogether is definitely not the solution.
- Social media can be the solution, not just the problem: Particularly in the Kaveri River water dispute, the Bangalore police used texts, Twitter, and Facebook to send out information on emergency contacts to reassure people.

On a resolution on **“The promotion, protection and enjoyment of human rights on the Internet”**, the UN Human Rights Council, guided by the Charter of the UN, said it was **“deeply**

concerned by all human rights violations and abuses committed against persons for exercising their human rights and fundamental freedoms on the Internet, and by the impunity for these violations and abuses”, and “also by measures aiming to or that intentionally prevent or disrupt access to or dissemination of information online, in violation of international human rights law”.

Conclusion:

Shutdowns, which are a negative expression of the idea of digital sovereignty, are not just for undemocratic societies any more. An internet shutdown compromises our democratic freedoms and should only be allowed in the rarest cases, rather than as a first response. Also an independent body could be a substitute for legislation which impose shutdown arbitrarily and that it also be empowered to review the necessity of shutdowns in the first place.

Curbing hate speech and fake news has emerged as a critical challenge for governments globally. But this is not just a technological issue; it is also a societal problem. Discuss. (250 words)

Reference : [Hindustan Times](#)

Why this question:

Online forums are often looked at in a vacuum, but they are merely a reflection of society. In India, polarising content and hateful material on the Internet has proliferated in the recent past. Opinions that an individual would earlier hold back for fear of societal backlash have now found their safe spaces online. The Internet harbours a variety of extreme statements.

Key demand of the question:

One has to discuss the various reasons for degradation of the lake ecosystems in India and provide the measures for safeguarding the same.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Explain the concept of fake news and hate speeches.

Body:

Give an account of how the fake news and hate speeches have manifested into various societal issues across the globe.

In 2019, a terrorist opened fire in two mosques that killed at least 49 worshippers and wounded dozens of others in Christchurch, New Zealand. The attack was live-streamed on Facebook by the perpetrator.

Discuss the challenges posed by hate speeches and fake news using social media?

Polarization of the society

Increased communal violence

Targeting of the minorities

Ghettoization etc.

Talk about how the Governments across the globe have started taking measures and implications of such stringent measures. Also, mention how Indian Cyber laws are toothless in tackling such cyber hate crimes.

Discuss the feasible measures to overcome these menaces.

Conclusion:

Conclude with a way forward.

Introduction

Fake news is a deliberate lie or a half-truth circulated with the intention to mislead or cause harm to a section of people. It is a type of yellow journalism that consists of deliberate misinformation or hoaxes spread via the traditional print, broadcasting news media, or via Internet-based social media.

Hate speech is an incitement to hatred against a particular group of persons marginalized by their religious belief, sexual orientation, gender, and so on. The Law Commission, in its **267th report** on hate speech, said such utterances have the potential to provoke individuals and society to commit acts of terrorism, genocide, and ethnic cleansing.

Both hate speech and fake news have overlapping areas and are a major threat to peaceful order of the society. Social Media aided by technological advancements has become a major vector of the two phenomenon.

Body

In the age of the internet (WhatsApp, Facebook, Twitter,) it is a serious problem as rumors, morphed images, click-baits, motivated stories, unverified information, planted stories for various interests spread easily among 35 crore internet users in India.

Why Hate Speech and Fake News are critical challenges for governments?

- **Internal Security:** The Muzaffarnagar riots of 2013 was triggered by a fake video that incited communal passions. In the West, hate speech combined with fake news on minorities has induced an anti-immigration sentiment (eg : France, Italy, Greece)
- **User homophily and Bubble phenomenon:** Users with matching political views exchange one-sided information and opinions that suit their own convictions, reinforcing them even further, even if those were based on false information. Eg : Twitter prompts users to follow those who express similar views or posts.
- **Igniting extremist sentiments:** Fake news' perpetuates, previously locally found, extremist ideas and groups together dangerously like minded people e.g. – Neo-Nazis in Germany, Separatists in Kashmir.
- **Mob lynching:** Rumors of child lifting in Jharkhand led to mob lynching on innocent victims.
- **Violence:** An atmosphere of violence and chaos is created directly or indirectly. The Christchurch Terror attack on a mosque by an extremist was a result of Islamophobia (a direct result of hate speech).
- **Misinformation and disinformation** due to hate speech and fake news have led to riots as seen in the Delhi Riots case 2020.

Hate Speech and Fake News: A Societal Problem

- **Targeted propaganda:** Democracy has been reduced to an advertisement campaign. The business conglomerates owned or tied up with political parties influence the views of the people by targeting their audience. Algorithmic filtering have created the cycle of enforcing and reinforcing belief systems and ensuring that we don't open our minds to diverse opinions.
- **Election Manipulation:** The issue of fake news has turned out to be a global menace. It has its role in deciding result of elections (Example: USA) to polarization of societies to communal riots to even crumbling the economies. Tolerance and harmony are victims of the new social media age.
- **Non-Utilitarian:** The anonymity that the internet lends was supposed to aid freedom of speech and, thereby, help democracy thrive. But, political elites have managed to design a grim nexus

between anonymity, capital, and technology to influence public opinion, promote political agendas, and disseminate fake and misleading news and information.

- **Tools for disharmony: Fake news** can divide people based on many fault lines, especially in a diverse country like India. It increases Ghettoization.
- **Deep Fake**, a new entrant to the arena is even vicious than spreading misinformation. It is used to combine and superimpose existing images and videos onto source images or videos using a machine learning technique known as generative adversarial network.

Measures to overcome the menace

- The world's biggest social media companies, including Facebook, Google, Twitter and ByteDance, are exploring an **industry-wide alliance** to curb fake news on their platforms in India.
 - The proposed alliance — to be named the **Information Trust Alliance (ITA)** — will be a grouping of digital platforms and publishers, fact checkers, civil society and academia that will aim to control the spread of harmful content, including fake news and hate speech.
 - **Facebook** has announced that it currently has over 500 full-time employees and at least 3,500 external contractors who focus on election work, on top of the 30,000 people across the company focused on safety and security issues.
- Coordinated attempts to amplify and spread misleading and false information sometimes seem to emanate from major political parties and activists who support them. **Election Commission of India** must tie up with tech companies to identify the creator of such news.
- **Educating the end-users** to be more discerning consumers of news by informing them of verification tools so that they can ascertain the accuracy of a news item before sharing it.
- **Press Council of India**, a regulatory body, can warn, admonish or censure the newspaper, the news agency, the editor or the journalist or disapprove the conduct of the editor or the journalist if it finds that a newspaper or a news agency has violated journalistic ethics.
- A better and more effective approach to limit the influence of hoaxes on WhatsApp and other platforms is to increase **media literacy**.
- The government should bring out a policy framework on the possible harm due to the internet messaging platforms to engage at a deeper level.
- Government of India could partner with local news groups to further educate citizens on how to identify real news from fake news.
- Imposing hefty fines, like in Germany the Social media companies face fines of up to €50m if they persistently fail to remove illegal content from their sites.

Conclusion

Government should **have a mechanism for immediately issuing of notice** against sites/people/agencies involved in spreading fake news. Secondly, Social media websites should be made **accountable** of such activities so that it becomes their responsibility to have better control over the spread of fake news. Finally, ordinary consumers of news can play a big role by, first, waking up to the reality that all they read on WhatsApp and Twitter is not the gospel truth, and then, by refusing to pass on what they cannot independently verify with other sources.

What is a cyber-threat? Discuss numerous challenges associated with cyber threats along with steps taken by the government to prevent it. (250 words)

Why this question:

The question is amidst the rising incidences of Cybercrime that the world community is facing.

Key demand of the question:

The question is straightforward and must discuss the challenges associated with cyber threats along with steps taken by the government to prevent it.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain cyber threat with its various forms.

Body:

A cyber or cybersecurity threat is a malicious act that seeks to damage data, steal data, or disrupt digital life in general. It also refers to the possibility of a successful cyber-attack that aims to gain unauthorized access, damage, disrupt, or steal an information technology asset, computer network, intellectual property or any other form of sensitive data.

Discuss various challenges associated with cyber threats in the country.

Analyze the various steps taken by the government and suggest way forward.

Conclusion:

Conclude by suggesting the way ahead.

Introduction:

A cyber or cybersecurity threat is a malicious act that seeks to damage data, steal data, or disrupt digital life in general. Cyber threats include computer viruses, data breaches, Denial of Service (DoS) attacks and other attack vectors. Cyber threats also refer to the possibility of a successful cyber-attack that aims to gain unauthorized access, damage, disrupt, or steal an information technology asset, computer network, intellectual property or any other form of sensitive data. Cyber threats can come from within an organization by trusted users or from remote locations by unknown parties.

Body:

India's preparedness and challenges faced:

- The attacks can be more tangible causing damage to physical or digital infrastructure.
 - This includes a country's water system or electric grid.
 - Cyber tentacles can spread to political parties, universities and private businesses and Citizens.
 - Potentially worrisome cyber incidents include interference in political affairs, leaks and espionage and the compromising of critical national infrastructure.
- A 2017 study conducted by Symantec found that India ranked fourth in online security breaches, accounting for over 5 per cent of global threat detections. In the beginning of 2017, the newly launched Bharat Interface for Money application (BHIM app) reportedly faced spam threats.
- The real danger to India lies in targeted cyber-attacks coming from adversarial nation states.

- Countries like China can bring immense assets to bear in carrying out sophisticated cyber-attacks. The success of Stuxnet, which damaged the Iranian centrifuge facility at Natanz is an example.
- Cyber warfare is characterized by an absence of clarity.
 - India can never be certain about the capability of the other side and also the chances of success if we launch a cyber-counterstrike.
- There is a push towards greater digital dependence with demonetization a cashless system is being propagated. Aadhaar and the wider platforms such Digital India and Smart Cities will push things further along. India is the world's second largest digital nation with more than 350 million Indians are online and millions more will be getting connected in the years to come.
- India is not even a signatory to some of the basic international frameworks on Cybersecurity like the Convention of Cybercrime of the Council of Europe which not only European nations but Japan, US, South Africa have become signatories to, except India.
- Indian laws are not in tandem with the ever-changing global cyberspace.
 - The laws are old and hence need to be more dynamic in nature to deal with issues like cyber-espionage, data theft and so on.
 - The Information Technology Act, 2000 (IT Act 2000) is the sole law that deals with cyberspace in India and was passed way back in 2000.
 - Also, the Cyber Law of India has been subject to amendments on various occasions but hasn't served the changing dynamics and the growing threats and manifestations of cyberwar.

Measures needed:

- **A Defence Cyber Agency** could be the first step the government plans to for critical infrastructure and military networks that are increasingly becoming dependent on the Internet, thus increasing vulnerabilities.
- The Defence Cyber Agency will work in coordination with the National Cyber Security Advisor. It will have more than 1,000 experts who will be distributed into a number of formations of the Army, Navy and IAF. According to reports, the new Defence Cyber Agency will have both offensive and defensive capacity.
- Equally important is **cyber propaganda**. During the Doklam conflict, China tried its best to unleash cyber propaganda on India and indulged in complex psy-ops
- **Critical cyber infrastructure** needs to be defended and the establishment of **the National Critical Information Infrastructure Protection Centre(NCIIPC)** is a good step in this direction
- Individual ministries and private companies must also put procedures in place to honestly report breaches. It is only then that the NCIIPC can provide the requisite tools to secure these networks. This partnership must be transparent and not mired in the usual secrecy of intelligence organizations.
- The **upgrading of the Defence Cyber Agency to a Cyber Command** must be implemented at the soonest.
- A robust ecosystem must be built to secure India from acts of state and non-state actors, including protocol for grievance redressal in international forums.
- Better capabilities must be built to detect and deflect attacks.

- The **computer emergency response team (CERT)** must be strengthened and aligned with military and foreign affairs operations.
- Building a joint task force between the government and key technology players will be crucial.
- The government should push for the creation of a **global charter of digital human rights**.
- A **national gold standard** should be created, which ensures that Indian hardware and software companies adhere to the highest safety protocols
- Impart cybercrime investigation training and technological know-how to the various law enforcement agencies.
- **Cyber awareness** must be spread and there should be multi-stakeholder approach- technological inputs, legal inputs, strengthening law enforcements, systems and then dealing with transborder crime involves lot of international cooperation.

Conclusion:

Most of the Indian banking industry and financial institutions have embraced IT to its full optimization. Reports suggest that cyber-attacks are understandably directed toward economic and financial institutions. With innovative, technology led programmes such as AADHAAR, MyGov, GeM, Digital Locker the new India is the land of technological prowess and transformation. Government and the private sector jointly have to give cyber security some priority in their security and risk management plan.

Discuss the role of social media in influencing political opinions and social attitudes in the country.(250 words)

Reference: [Research Gate](#)

Why this question:

The question is straightforward and aims to analyse the role of social media in influencing political opinions and social attitudes in the country.

Key demand of the question:

One has to explain the role played by social media in affecting the political opinions and social attitudes in the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

First explain what constitutes social media.

Body:

Social Media [has rapidly grown in importance](#) as a forum for political activism in its different forms. Social media platforms, such as Twitter, Facebook and YouTube provide new ways to stimulate citizen engagement in political life, where elections and electoral campaigns have a central role. Present the positives and negatives such as Social media has reshaped [structures and methods](#) of contemporary political communication by influencing the [way politicians interact with citizens and each other](#). However, the role of this phenomenon in increasing political engagement and electoral participation is neither clear nor simple.

Discuss its overall impact.

Conclusion:

Conclude with solutions.

Introduction:

Social media plays an integral role in our lives today and has a huge bearing on society and individuals. Social media has revolutionized the way people communicate and socialize on the web. There is a positive effect on business, politics, socialization as well as some negative effects such as cyberbullying, privacy, and fake news. After legislature, executive, Judiciary, Media and Common Man, the sixth pillar of the democracy is touted to be 'Social Media'. All these pillars have the capacity to change the status-quo and undone wrongdoing.

Body:

Role of social media in influencing political opinions and social attitudes

Given the tremendous growth of social media, in particular Twitter and Facebook, social media are increasingly used in political context recently—both by citizens and political institutions.

News Around the Clock: One of the ways that social media has transformed politics is the sheer speed at which news, poll results and rumors are shared. Whereas in the pre-internet days, people had to wait for the next newspaper or TV news show to get the latest information, online news is a 24/7 phenomenon. While you can access news on many websites at any hour, most people spend more time on sites such as Facebook and Twitter than they do on serious news or political websites.

The Impact of Polls: Political polls are an important part of every campaign. They are often confusing, because you can often find multiple polls with contradictory results posted on the very same day. As with other types of political news, the internet has greatly increased the number of poll results we see each day. Social media has accelerated this even more. Not only do social media sites report the results of polls, you can actually participate in Facebook polls. E.g.: The recent US presidential campaign in 2016 has shown that social media technologies have become increasingly important for political communication and persuasion

Direct Interaction with Politicians: One of the positive effects that social media has on politics is the opportunity for voters to interact more easily with candidates and elected officials. Traditionally, if you wanted to meet a politician or candidate, you'd have to attend a live event. Not everyone is able to do this. With modern technology, it's now possible to attend virtual events where you can participate in live streaming events and interact with politicians and candidates.

Demographics and Targeting: Targeting is used throughout the advertising industry to make sure that ads and messages reach the right audience. Politicians do this as well. In the age of social media, politicians and people running for office are able to target their campaigns. If a candidate wants to address the concerns of women, college students, retired people, Latinos or any other group of voters, they can now tailor their messages. Just as advertisers on Facebook are able to use analytics and targeted advertising, so can candidates and politicians. Thus, if you notice that political messages seem to be talking to you personally, this is no accident.

Rumors, Fake News and Conspiracies: Political campaigns are now influenced by every story, whether true or not, that gets spread around social media. It's getting more and more difficult to separate actual news from fake news online. Social media makes this distinction especially confusing. The constant stream of memes, links and rumors about political leaders and candidates is a mixture of truth, lies, satire and speculation.

The Power of Confirmation Bias: One of the hidden forces that operates on social media is confirmation bias. This is especially powerful when it comes to controversial topics, including politics. If you're like most people, the majority of your friends and followers on social media

probably share your outlook. This means that the vast majority of tweets, Facebook posts, pins or other content you read on these sites tend to express the same point of view, one that you already hold.

Social Media and the Future of Politics: Because social media is relatively new, we're just starting to see its impact on society. There are sure to be many political changes that come about due to social media. There are now proposals for internet voting, which could lead to more people participating in elections. This could make social media even more influential, as people could literally vote moments after reading the latest comments or links they found on Facebook or Twitter.

Pros:

- The hashtag activism empowers people to speak up injustice without fear. Some recent examples are #not in my name, #MeToo.
- Social media provide solidarity and sense of companionship to those unable to reach government or raise their voice.
- It has long been observed that when people discuss the news, they're more likely to be involved in their community, whether by volunteering or reaching out to elected officials. There is growing evidence that this is also true for social media — especially among young people.
- Social media platforms are driving people not just to learn about issues but to take action. For e.g.: During the 2016 US election alone, the voter registration efforts on Facebook led more than 2 million people to register to vote.

Cons:

- Online abuse, hate speech and harassment is perpetuating with anonymity. Policing the content at a global scale is an open research problem since it is hard for machines to understand the cultural nuances of political intimidation.
- The unbridled exercise of power on online platform is out of government regulation.
- It has become a medium to influence youth by the terror outfits
- The spreading of fake news which hampers peace and tranquility of a nation is rapid and complete.
- One of the most common criticisms of social media is that it creates echo chambers where people only see viewpoints they agree with — further driving us apart.
- While foreign meddling, misinformation, echo chambers and hate speech get the headlines, it is also worrisome that how social media can distort policymakers' perception of public opinion.
- The 2016 US presidential election brought to the fore the risks of foreign meddling, "fake news" and political polarization. The effect of social media on politics has never been so crucial to examine.
- If politicians mistake the views of a few with the views of many, that can make for bad public policy. Vulnerable populations could end up ignored, and fringe groups could appear mainstream.

Conclusion:

The use of social media for political activities influences peoples' political efficacy, political knowledge, and political participation. Social media must be submitted to the same rules that are established for other media such as clear accountability and transparency. This would probably require new international laws. Moreover, the big companies should continue looking for ways to prevent the abuse of their media.

Media is labeled as the fourth pillar of democracy. In this context, discuss the significance of media ethics in contemporary times. (250 words)

Reference: [The Hindu](#)

Why this question:

The question is about the significance of media ethics in contemporary times.

Key demand of the question:

One must explain in what way Media is the fourth pillar of Democracy and discuss the significance of media ethics in contemporary times.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Highlight the growing importance of media in a democracy. Explain that Legislature, Executive, Judiciary and Media are pillars of a democracy. Corruption in any one of these pillars can lead to unstable, flawed or dummy democracy. Media has gained importance in the 21st century due to technological revolution, Human Development, and increasing interconnectedness of the world.

Body:

Highlight some ethical issues currently faced by the media towards jeopardizing democracy. Explain that such processes naturally place media's role in democracy under scrutiny of ethical principles and standards in its functioning due to following reasons – Manipulation of Information, Furthering vested interest, conflict with law, Issues of transparency, accountability and independence etc.

Present recent examples to justify your answer better.

Conclusion:

Conclude by highlighting the need of media ethics and suggest some measures for its implementation.

Introduction:

Media acts as a watchdog of public interest in a democracy. It plays an important role in a democracy and serves as an agency of the people to inform them of the events of national and international significance. Media is considered as "Fourth Pillar" in democratic countries along with Legislature, Executive, and Judiciary. Its importance in influencing readers can be gauged by the role it played during the freedom struggle, politically educating millions of Indians who joined the leaders in their fight against the British imperialism.

Body:

Importance of Media in today's India:

- Journalism is a profession that serves. By virtue, thereof it enjoys the privilege to 'question' others.
- The fundamental objective of journalism is to serve the people with news, views, comments and information on matters of public interest in a fair, accurate, unbiased and decent manner and language.
- The press is an indispensable pillar of democracy. It purveys public opinion and shapes it. Parliamentary democracy can flourish only under the watchful eyes of the media. Media not only reports but acts as a bridge between the state and the public.

- With the advent of private TV channels, the media seems to have taken over the reins of human life and society in every walk of life.
- The media today does not remain satisfied as the Fourth Estate, it has assumed the foremost importance in society and governance. While playing the role of informer, the media also takes the shape of a motivator and a leader.
- Such is the influence of media that it can make or unmake any individual, institution or any thought. So all pervasive and all-powerful is today its impact on the society. With so much power and strength, the media cannot lose sight of its privileges, duties and obligations.

Significance of Media ethics in contemporary times:

- The issues of paid news, media trial, non-issues being presented as real news while the real issues are sidelined, the **news is being doctored and fact distortion for profits and political favour, fake news, yellow journalism** are important concerns which are influencing public and impacting national security. For instance, fear mongering through media has led to mob lynchings, attacks on the migrant population.
- The **absence of objective journalism** leads to the false presentation of truth in a society which affects the perception and opinions of people. As observed in the case of Cambridge Analytica case, the biased news coverage on social media platform affected the Presidential elections in the U.S.
- **The chase for sensationalism and higher TRP rates** as observed in the coverage of 26/11 terrorist attacks in India risked the internal security of the nation. The sensationalism-driven reporting compromised the identities of rape victims and survivors despite SC guidelines.
- **Trial by media** does not follow the due process of law and can reduce the public trust in institutions of governance like the judiciary.
- **Paid news and fake news** can manipulate public perception and can instigate hatred, violence, and disharmony among the various community within society.
- With the **advent of social media, technological changes, the reach of media has grown profoundly**. Its reach and role in impacting public opinion have made it even more important to ensure its objectivity, non-partisanship calls for the enforcement of journalistic ethics.

Conclusion:

It is therefore important that for the media to carry out their important role effectively and efficiently, the media should operate within a well-defined code of ethics while maintaining their freedom and editorial independence. Since irresponsible journalism invites restriction, robbing off the media its freedom, professional conduct and ethical practice are vital to safeguarding freedom of the media and ensuring that public trust invested in the media is sustained.

In the light of the spread of misinformation regarding COVID-19 on social media networks, analyze the apprehensions associated with the spread of fake news in the present context. Propose suitable measures to tackle it.(250 words)

Reference: [The Hindu](#)

Why this question:

Misinformation linked to supposed cures for COVID-19 and misleading claims have proliferated on social media networks. Thus the question.

Key demand of the question:

One must analyze the apprehensions associated with the spread of fake news in the present context.

Directive:

analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Define what fake news is.

Body:

Explain Fake News pandemic:

In the light of the pandemic, the social media platforms have witnessed:

Misleading claims on supposed cures and posts related to ‘treatments’ that are not proven.

Medicine sales pitches or claims of techniques to prevent exposure and infection that are either not proven and/or filled with a lot of misleading information.

Conspiracy theories about the outbreak.

Instructions for individuals to stock up on supplies and food.

The misinformation about the pandemic has been deadly. False reports have appeared in numerous countries.

Discuss the concerns involved – issue of panic buying, claims can cause confusion among the public etc.

Conclusion:

Conclude with suitable measures to tackle the issue.

Introduction:

Fake news is a deliberate lie or a half-truth circulated with the intention to mislead or cause harm to a section of people. It is a type of yellow journalism that consists of deliberate misinformation or hoaxes spread via the traditional print, broadcasting news media, or via Internet-based social media.

The novel coronavirus, however, has opened up an entirely different problem: the life-endangering consequences of supposed cures, misleading claims, snake-oil sales pitches and conspiracy theories about the outbreak.

Body:

In the age of the internet (WhatsApp, Facebook, Twitter,) it is a serious problem as rumors, morphed images, click-baits, motivated stories, unverified information, planted stories for various interests spread easily among 35 crore internet users in India

Apprehensions associated with the spread of fake news in the present context:

- A study on COVID-19 misinformation that was published earlier this month.
- Using controlled tests with more than 1,600 participants, the study found that false claims were shared in part simply because people failed to think about whether the content was reliable.
- In a second test, when people were reminded to consider the accuracy of what they are going to share, their level of truth awareness more than doubled.
- That approach—known as “accuracy nudge intervention”—from social media companies could limit the spread of misinformation, the report concluded.
- In Iran, a fake remedy of ingesting methanol has reportedly led to 300 deaths, and left many more sick.
- Posts related to ‘treatments’ that are not proven, techniques to prevent exposure and infection that are either not proven and/or filled with a lot of misleading information, and instruction for individuals to stock up on supplies and food

- Two types of danger are posed by inaccurate information on the virus: that it “could incite fear or panic,” and “the potential for individuals to do harmful things in hope of ‘curing the illness’ or ‘preventing’ the illness.”

Suitable measures needed:

- The world’s biggest social media companies, including Facebook, Google, Twitter and ByteDance, are exploring an **industry-wide alliance** to curb fake news on their platforms in India.
 - The proposed alliance — to be named the **Information Trust Alliance (ITA)** — will be a grouping of digital platforms and publishers, fact checkers, civil society and academia that will aim to control the spread of harmful content, including fake news and hate speech.
 - **Facebook** has announced that it currently has over 500 full-time employees and at least 3,500 external contractors who focus on election work, on top of the 30,000 people across the company focused on safety and security issues.
- Facebook has placed authoritative coronavirus information at the top of news feeds and intensified its efforts to remove harmful content, including through the use of third-party fact checkers.
- a public health crisis is an easier arena than politics to set policies and to take a harder line on questionable content.
- AFP and other media companies, including Reuters and the Associated Press, work with Facebook’s fact checking program, under which content rated false is downgraded in news feeds so that fewer people see it
- **Educating the end-users** to be more discerning consumers of news by informing them of verification tools so that they can ascertain the accuracy of a news item before sharing it.
- **Press Council of India**, a regulatory body, can warn, admonish or censure the newspaper, the news agency, the editor or the journalist or disapprove the conduct of the editor or the journalist if it finds that a newspaper or a news agency has violated journalistic ethics.
- A better and more effective approach to limit the influence of hoaxes on WhatsApp and other platforms is to increase **media literacy**.
- The government should bring out a policy framework on the possible harm due to the internet messaging platforms to engage at a deeper level.
- Government of India could partner with local news groups to further educate citizens on how to identify real news from fake news.
- Imposing hefty fines, like in Germany the Social media companies face fines of up to €50m if they persistently fail to remove illegal content from their sites.

Conclusion

Government should **have a mechanism for immediately issuing of notice** against sites/people/agencies involved in spreading fake news. Secondly, Social media websites should be made **accountable** of such activities so that it becomes their responsibility to have better control over the spread of fake news. Finally, ordinary consumers of news can play a big role by, first,

waking up to the reality that all they read on WhatsApp and Twitter is not the gospel truth, and then, by refusing to pass on what they cannot independently verify with other sources.

APRIL 2020

Indian Economy and issues relating to planning, mobilization of resources, growth, development and employment.

With limited fiscal space and amidst the uncalled financial distress, the onus for economic revival rests with the RBI. Do you agree? Examine.(250 words)

Reference: [The Hindu](#)

Why this question:

The question is amidst the financial downturn that India is going to face in its near future owing to the distress caused by the corona outbreak.

Key demand of the question:

Explain in what way India's financial distress was exacerbated by the pandemic. With limited fiscal space, the onus for economic revival rests with the RBI.

Directive:

Examine – When asked to 'Examine', we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Briefly explain the context of the question.

Body:

First, present the factors that have caused the financial crisis – The constantly evolving Covid-19 pandemic have cast a long shadow on the global economy, which was already jolted by the US-China trade war.

Comment on the fears of a possible global recession; massive supply-chain related disruptions across a range of industries from containment efforts in China and other economies; amplification of demand-side shocks due to uncertainties as well as lockdowns and other containment measures domestically; and propagation of financial shocks and the US dollar credit crunch etc.

Discuss the role that RBI needs to play to handle the situation.

Conclusion:

Conclude by suggesting measures to address the issue.

Introduction:

The constantly evolving Covid-19 pandemic has cast a long shadow on the global economy, which was already jolted by the US-China trade war. India's financial distress was exacerbated by the pandemic. This global shock comes at a particularly inopportune time for India, as the economy was already on a very concerning downward trajectory since the turn of FY 2018-19.

Body:

With the fears of a global recession on the horizon, Covid-19 appears to have dealt the global economy a triple-whammy:

- Massive supply-chain related disruptions across a range of industries from containment efforts in China and other economies.
- Amplification of demand-side shocks due to uncertainties as well as lockdowns and other containment measures domestically.
- Propagation of financial shocks and the US dollar credit crunch.

India's financial situation currently:

Chart 1

The roots of India's economic drag in recent years:

- Aftermath of the drastic demonetization experiment, which led to significant collateral damage.
- The effects of the rollout of the GST.
- Both these supply-side measures may have been well-intended, they have certainly contributed to marked economic disruptions.
- This has led to a deeply entrenched slowdown in the informal sector.
- This has, in turn, been exacerbated by acute banking sector problems, with banks being saddled by non-performing assets (NPAs) partly driven by “crony capitalism” stemming from the close nexus between banks and large “politically connected” businesses, giving rise to dubious lending practices and bad loans.
- Added to these banking woes has been a generalized credit crunch in the financial system due to stresses in the non-bank financial sector, especially following the collapse of Infrastructure Leasing & Finance Services (IL&FS).
- India's inability to exploit investor interest in looking beyond China (as Vietnam has, for instance), is a failure of the country's flagship “Make in India” initiative which seems to be becoming an excuse to revert to a degree of protectionism rather than of enhancing export competitiveness per se.

Impacts of COVID-19 on Indian Economy:

- The immediate economic and market impacts of the coronavirus have been on India's financial markets as well as the rupee, which hit a new low vis-à-vis the US dollar in March due to global risk-off sentiment
- For firms laden with dollar-denominated debts, a continuous weakening of the rupee is likely to intensify their struggles to repay their obligations.
- Beyond the financial shocks, India has to urgently find a way to cushion the demand-side shocks induced by potential lockdowns and other ongoing containment measures.
- a prolonged lockdown in the near future is likely to be economically costly, with the brunt of the pain falling disproportionately on those in the informal sector.

**Fiscal measures needed:**

- India will have to undertake more aggressive counter-cyclical fiscal measures at some stage to buffer against acute negative shocks arising from the spread of Covid-19.
- an appropriate fiscal response is imperative to uplift the economy and especially assist the most vulnerable, a massive fiscal expansion of the type envisaged by many other countries is likely to exceed the fiscal targets set by the FRBM.
- This would imply that the government has to either invoke the escape clause or ignore the rule temporarily with the hope of returning to a path of fiscal consolidation once the Covid-19 storm has been weathered.

Monetary measures by RBI:

- The Central bank has also taken some steps to ease the dollar credit crunch via long-term repo operations (LTRO).
- It offered a \$2-billion swap for six months to ease the pressure on the rupee.
- RBI took measures although it has not been part of the coordinated action by central banks in taking even more aggressive measures to counter the heightened volatility and adverse economic fallout from the coronavirus.

Conclusion:

Even if the RBI rolls out more aggressive measures, the broader concern that still remains is the inadequate monetary policy transmission that limits the effectiveness of any monetary stimulus in India, especially in the context of an impaired financial sector. Thus, the government must refocus its priorities towards dealing with economic stabilization and upliftment rather than pursue the more controversial aspects of its social and political agenda.

In what way can the vision and goals of the newly emerged start-ups be made more realistic during uncertain times in the country? Elucidate.(250 words)

Reference: [Live Mint](#)

Why this question:

The question is amidst the woes start-ups across the country are facing owing to the effects of pandemic.

Key demand of the question:

Explain how the vision and goals of the newly emerged start-ups be made more realistic during uncertain times in the country and that can help start-ups pass the storm.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:**Introduction:**

A start-up is a company or project initiated by an entrepreneur to seek, effectively develop, and validate a scalable business model.

Body:

Briefly discuss the issues and challenges the start-ups across the country are facing from supply constraints to funding.

Explain with specific examples such as – The outbreak has created new challenges across sectors, with start-ups, particularly those in the health space, bearing the brunt of the disruption caused by the 21-day lockdown.

Suggest measures to address the above challenges.

Conclusion:

Conclude that proper strategy, increase in customer interaction etc. help startups to turn adverse situations into their favor and make them realize their goals better than before.

Introduction:

The full impact of covid-19 on the world and our economy is impossible to be gauged. It is one of the most severe global crisis faced by the world in last 100 years. Some startups in areas like edutech, online gaming, collaboration, food delivery or healthcare will see growth during this period, others will face difficult choices in the weeks and months ahead. Startups, particularly those in an early stage, operate with a high level of uncertainty during the normal course of business.

Body:

Indian Startup Ecosystem:

- India is home to the world's third largest startup ecosystem, having added over 1,300 tech startups in 2019.
- India now hosts 24 unicorns—a term to describe startups valued at \$1 billion—the third-highest number of unicorns in a single country in the world.
- The volume of investments in startups also grew.
- Startups created 60,000 direct jobs in 2019 alone.
- The start-up landscape in the country is becoming the epitome of innovation, with companies bringing out solutions that are aimed at solving locally relevant issues.
- Startups can act as vehicles for socio-economic development and transformation.
- India has immense potential both in terms of technological innovation and implementation of business models.
- In light of the current economic environment, IPOs from India into the US could emerge over the next 12 to 18 months

Measures for an emerging Indian startup ecosystem in such times of crisis:

- **Focus on safety and engagement:**
 - Many of our startups have been working from home for several weeks now.
 - Some have seen increase in productivity, while others have seen a drop of 15-20%.
 - The mantra here is to enable the teams with the right tools, develop daily rhythms to ensure seamless operations, set daily or weekly goals and, most importantly, communicate, communicate and communicate.
 - Engaging the employees, often and with empathy, is critical.
 - Set up a regular cadence of team video calls and check in often on how team members are doing—both personally and professionally.
- **Plan for a range of 'worst-case' scenarios:**
 - Map out all possible scenarios, come up with a strategy for each one and figure out how you can extend your runway in the most likely scenarios.
 - Think about what you can cut, from marketing costs through to leases.

- The last area you should consider reducing is staff costs, because these are the people helping you build your dream.
- If you must address talent, talk with your team about a combination of options—pay cuts or deferrals, alternate working days, furloughs and reassigning roles—before reducing headcount. And if you must cut pay, lead from the front.
- Start with your own, then trim executive pay before others.
- **Focus on customer engagement:**
 - Take this time to get even closer to your customers.
 - Think of innovative ways in which you can connect with your users: gamification, online forums, or even asking customers to co-create new product lines.
 - If your brand can give back to the community in some way, do that, too. It's a great time to show empathy and to demonstrate to customers that you care.
 - If you are a B2B company, take this time to understand what your customers' priorities are. Consider changing your narrative to align with those needs.
- **Double down on your product:**
 - This is a good opportunity to build the “must-have” you have been waiting to add to your product, or think about how to engage new audiences.
 - By staying close to the market, you may find new opportunities.
 - Companies with an offline component are accelerating their digital transformation. Logistics may be mired right now, but that will be resolved soon.
 - Covid-19 is a wake-up call for consumer companies without an e-commerce strategy.

Conclusion:

The current crisis is not like any financial downturn we have seen in recent history. But tough times can bring out the best in startup, its leadership team and your organization, bringing teams closer together and driving clarity in a startup's mission and vision.

Can Health sector be a way out of the middle-income trap for India in the coming future? Discuss the possibilities and give your opinion.(250 words)

Reference: [Economic Times](#)

Why this question:

The question propounds upon the prospects of the Indian health sector in the coming future.

Key demand of the question:

Explain the prospects of Indian health sector/industry post corona pandemic and if it can be a way out for its middle-income trap.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain the importance of India's health sector.

**Body:**

First explain in what way India is amongst one of the most capable countries that are handling/containing the situation very well.

Explain the potential that India has in terms of Health industry.

Post-pandemic, India may thus support the world with health infrastructure as its centerpiece.

Hint at the on-going efforts of India to fight the pandemic.

Conclusion:

With a health-centered investment agenda, India can supply doctors, nurses, paramedics, technicians and other medical professionals to the world. It can also supply valuable data and analytics. Even with the country busy fighting the coronavirus, planners need to start thinking of tomorrow's battles.

Introduction

Even before the coronavirus, India was at a crossroads. At roughly \$2,000 a year, per capita income in 2018 was half of what the country needed to become an upper-middle-income economy. Catching up with advanced nations posed a more daunting challenge.

The debate was whether India should become a manufacturing hub to the world and take over China or prioritizing the domestic economy, expanding its rather narrow base of mass consumption. The answer in the **post-pandemic world** may support the second strategy, **with health infrastructure** as its centerpiece.

Body**India's potential in healthcare**

- According to the Indian Brand Equity Foundation (IBEF), India is the **third-largest exporter** of pharmaceutical products in terms of volume. Around 80% of the market is composed of **generic low-cost drugs** which seem to be the major driver of this industry.
- The **medical devices sector** is the smallest but one of the fastest-growing sectors in the country like the health insurance marketplace. Recently, the government has been positive on clearing regulatory hurdles related to the import-export of medical devices, and has set a few standards around clinical trials.
- India is a popular destination for **medical tourists**, given the relatively low costs and high quality of its private hospitals. International students / patients in India should expect to rely on private hospitals for advanced medical care.
- **Alternate medicine:** India also is a top destination for medical tourists seeking alternative treatments, such as Ayurveda medicine and naturopathies therapies. Homeopathy, Unani are also being popularized in recent times.
- **Medical Education:** Medical education infrastructures in the country have shown rapid growth over the past few years.
 - The country has 529 medical colleges, 313 Dental Colleges for BDS & 253 Dental Colleges for MDS.
 - The total number of admissions for academic year 2019-20 in Medical Colleges is approx. 70,000 including Government & Private Medical colleges.
 - The Dental Colleges saw an admission of 26,960 in BDS and 6,288 in MDS in the academic year 2018-19.

Can healthcare be India's way out of Middle Income trap?

Yes

- India's pharmaceuticals is robust and export of Hydro-chloroquine to many nations during the covid-19 crisis is a testament to this.
- The estimated Foreign Tourist Arrivals (FTAs) in the country on Medical purpose during the years 2015, 2016 and 2017 are **34 lakh, 4.27 lakh and 4.95 lakh** respectively. It offers a diverse portfolio of niche tourism products – cruises, adventure, medical, wellness, sports, MICE, eco-tourism, film, rural and religious tourism. India has been recognized as a destination for spiritual tourism for domestic and international tourists.
- Current financial year (2020), India is expected to rank amongst the top 3 healthcare markets in terms of incremental growth.
- The present year, the healthcare information technology market is expected to grow 1.5 times from current US\$1 billion.
- By 2022, the diagnostics market is expected to grow at a CAGR of 20.4% to reach US\$32 billion from US\$5 billion in 2012.
- Current financial year, the Indian telemedicine market is expected to grow at a Compound Annual Growth Rate (CAGR) of 20% to reach US\$32 million from US\$15 million.

No : Shortcomings of India's healthcare sector

- **Overstretched health infrastructure:** A single state-run hospital for every 55,591 people on average and a single hospital bed for every 1,844 people.
- **Shortfall of Doctors:** India needs about 10 times more doctors to meet the norms prescribed by the World Health Organization, a shortfall of at least 500,000 doctors.
- **Regional Disparity:** India's health performance, an index that includes access to primary care, maternal mortality rates and child health, runs the spectrum, with some states outperforming others by almost 2.5 times, according to the government-run think tank NITI Aayog.
- **Health care spending:** India spent an average of **\$62.72 per person** on health care in 2016, according to WHO, compared to China's \$398.33. India is yet to increase public expenditure on health to 2.5% of GDP as per the National Health Policy 2017 as against 1.2% GDP now.
- The **Global Burden of Disease study of 2016** (GBD 2016), published in the medical journal Lancet in 2018, put India at number 145 among 195 countries (including sub-Saharan Africa), in the Healthcare Access and Quality (HAQ) Index.
- The World Health Organisation (WHO) data shows India's Out of Pocket **OOP expenditure stood at 65% in 2016**, the last year for which the comparative data is available.

Way Forward

- One way to solve this problem is to address the infrastructure issue, by standardising diagnostic procedures, building rural clinics, and developing streamlined health IT systems, and improving efficiency.
- The need for skilled medical graduates continues to grow, especially in rural areas which fail to attract new graduates because of financial reasons.
- India needs to be becoming a major international hub for the global healthcare industry. It is already home to the world's largest medical tourism zone. The hubs would stimulate private investment in new developments from domestic and international players, Research & Development in medical field, advanced technology zone including Global University for Healthcare sector and its focus on becoming a global medical tourism hub.

- The hub of a diverse healthcare economy that includes the life sciences and a digital health cluster that leverages the strong private investment/venture capital landscape, major academic medical centers, institutions of higher learning and a highly skilled and educated workforce to meet the shortage of healthcare workers in India.

Conclusion

There should be a strong commitment from both the public and private sectors. Players from both sides must work together and investing to continue building an ecosystem that fuels innovation in the life sciences and digital health industries. The healthcare innovations and unprecedented public-private support could boost the healthcare economy in India and overcome the middle income status.

Explain in what way using dollar swap line with other countries can help the Indian economy in uncertain times. (250 words)

Reference: [Indian Express](#)

Why this question:

India is working with the United States to secure a dollar swap line that would help in better management of its external account and provide extra cushion in the event of an abrupt outflow of funds, according to banking industry and government sources. Thus the question.

Key demand of the question:

Explain the utility and benefits of using a dollar swap line in the current conditions of the pandemic.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly explain what a dollar swap line is.

Body:

To start with explain that while India is largely expected to tide over any challenge posed by continued outflows of funds from the markets, a swap line with the US Federal Reserve provides additional comfort to the forex markets. Discuss how a swap facility works. Explain how a currency swap agreement acts as a tool for quantitative easing of the Indian economy.

Conclusion:

Conclude with importance of it.

Introduction:

Dollar swap is a kind of currency swap wherein between the two countries, there is an agreement to exchange currencies with predetermined terms and conditions. India is working with the United States (US) to secure a dollar swap line. It would help in providing an additional comfort in an event of any abrupt outflow of funds. India already has a currency swap facility with other central banks like Japan, SAARC nations, UAE etc. Currently, India, China, Russia, Saudi Arabia and South Africa do not have a currency swap line with the US.

Body:

Working of Currency swap lines:

- In a swap arrangement, based on the market exchange rate at the time of the transaction,
- The US Fed provides dollars to a foreign central bank, and
- The bank provides the equivalent funds in its currency to the Fed.

- The parties agree to swap back their currencies at a specified date in the future, at the same exchange rate as in the first transaction.
- These swap operations carry no exchange rate or other market risks, as transaction terms are set in advance.

Current need for currency swap line:

- Forex reserves/assets are assets held on reserve by a central bank in foreign currencies. These may include foreign currencies, bonds, treasury bills and other government securities. These are held to ensure that a central bank has enough funds if its national currency weakens/ devalues rapidly.
- As concerns on the economic effects of COVID-19 hit investor sentiment, Foreign institutional investors (FIIs) have been large sellers of Indian equity and debt markets in March and April so far leading to outflow of funds from the country.
- To stabilize the rupee which recently fell below the 76 level against the dollar, India liquidated its forex assets.
- India's foreign currency assets had declined by around \$7.50 billion in two weeks to \$ 439.66 billion as on March 27.
- According to Reserve Bank of India (RBI) data, 63.7 per cent of India's foreign currency assets — or \$256.17 billion — is invested in overseas securities, mainly in the US treasury.
- While India is expected to comfortably tide over any challenge posed by continued outflows of funds from the markets, given the adequacy of foreign exchange reserves, a swap line with the US Fed provides an additional comfort to the forex markets.

Advantages of dollar swap line:

- A swap line with the US Federal Reserve would help in better management of the external account of India.
- It would also provide extra cushion in the event of an abrupt outflow of funds from the forex markets.
- So far, foreign institutional investors (FIIs) have been large sellers in the Indian equity and debt markets in March and April 2020.
- There is apprehension that the economic impact of COVID-19 will last for a significant length of time.
- So, the government and the Reserve Bank of India (RBI) cannot lower their guard on the management of the economy and external account.

Conclusion:

These swap operations carry no exchange rate or other market risks as transaction terms are set in advance. Central banks and Governments engage in currency swaps with foreign counterparts to meet short term foreign exchange liquidity requirements or to ensure adequate foreign currency to avoid Balance of Payments (BOP) crisis till longer arrangements can be made.

Explain in the backdrop of the COVID-19 pandemic, how dependence on a more liberalized economic model has proved to be counter-productive and disastrous for the country. (250 words)

Reference: [The Hindu](#)

Why this question:

The authors of this article argue that the COVID-19 pandemic reveals how dependence on a more liberalized economic model has proved to be counter-productive and disastrous in the current scenario. Thus the question.

Key demand of the question:

One must evaluate the challenges related to the liberalized economic model amidst the COVID-19 pandemic.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly set the background of the question's context.

Body:

To start with, explain the change in the industrial model in the past – in the late 1980s, transnational corporations started shifting their production base to developing countries, especially Asia, in search of cheap labour and raw materials. Developed countries supported the move as it helped them shift the polluting and labour-intensive industries to other countries, while still retaining the ownership. Thus, the world witnessed the development of global supply chains in many products. Discuss the current case; explain the fallacies brought out by the COVID-19 situation. Take hints from the article to form your answer content. Present the case of India.

Conclusion:

Conclude that the current pandemic should lead the countries to rethink and reevaluate the economic efficiency theory propounded by the LPG principle. There should be the emphasis on an industrial policy that helps maintain core capacity in essential products.

Introduction:

India's LPG reforms in 1991-92 marked the beginning of the end of the 'License Raj' in India. The Budget also announced the reduction of import duties and paved the way for foreign-manufactured goods to flow into India. Though many developing countries participated in the global production, the substantial value addition in developing countries happened in a few production hubs, of which China emerged to be a major one.

Body:

Economic liberalization and its impacts on the governments' capacity to deal with the crisis:

▪ **Undermining the manufacturing capabilities of health products in India through imports:**

- The short-sighted liberalization policy measures, with the objective of enhancing profitability of the private sector, allowed the import of raw materials from the cheapest sources and resulted in the debasing of the API industry, especially in essential medicine.
- According to a report of the Confederation of Indian Industry (CII), nearly 70% of India's API import is from China.
- The disruption in the supply of API due to the COVID-19 outbreak has impacted the production of not only medicines required for COVID-19 patients, but also of other essential medicines in India.

▪ **Import dependency:**

- Dependence on imports affects the ability of Indian diagnostic companies to provide an affordable test for all those who want to test for COVID-19. Now the country is not able to get required quantities of test kits, PPE and parts of ventilators through importation.
 - The dependence on Reagents, an important chemical component for testing, is limiting the capacity of the government from expanding testing because the cost of each test is ₹4,500.
 - There are only a few domestic manufacturers who can produce PPE and medical devices like ventilators.
- **Loss of jobs and poor working conditions:**
- Through liberalization developing countries were asked to ease their labour protection laws to facilitate global production and supply chains popularly known as global value chains.
 - As a result, people were forced to work in precarious working conditions without any social security net.
 - This created an unorganized army of labourers and is preventing many developing country governments from effectively offering relief.
 - The resultant loss of manufacturing base has affected the ability of many governments, including of developed countries, to put up an effective response to the crisis.
 - The U.K. Prime Minister asked the country's manufacturers to produce ventilators in order to provide care for critical COVID-19 patients.
 - Spain nationalized all its private hospitals.
 - In an indirect show of power, Chinese billionaire Jack Ma sent a flight containing 5.4 million face masks, kits for 1.08 million detection tests, 40,000 sets of protective clothing and 60,000 protective face shields to the U.S exposing USA's import dependency.
- **Lack of credible information about the private sector:**
- For instance, as part of the removal of 'License Raj', the government stopped asking for information from the manufacturer to file the quantity of production of various medicines.
 - As a result, it has taken weeks now and a series of meetings for the government to gather information about stocks and the production capacity of pharmaceutical companies.
 - Similarly, there were difficulties in finding out India's production capacity of PPE, medical devices and diagnostics.
 - The only government data available in the public domain is with regard to the production of vaccines.

Way forward for the private sector companies in today's crisis:

- In the Covid-19 response, the private sector in the country — for-profit and not-for-profit segments — has to play an even more important role, as it is the dominant provider of health services.
- The National Sample Survey Office's 71st round data shows that private hospitals, clinics and nursing homes provide over 70% of health care.
- Data on the nearly 10 million treatments received under the Ayushman Bharat Pradhan Mantri Jan Arogya Yojana (AB PM-JAY) corroborate this finding.
- According to the World Health Organization, a critical lesson from the 2014-16 West African Ebola crisis is that both the public and private sectors need to work in tandem in responding to large-scale epidemics. So, the private sector-led economic growth model deserves a rethinking so that there is better coordination between the government and the private sector to deal with such a crisis.

Analyse the impact of Corona virus pandemic on the Indian Pharma sector.(250 words)

Reference: [Economic Times](#)

Why this question:

The article brings to us a detailed narration of the effects of ongoing pandemic on the Indian Pharmaceutical Industry.

Key demand of the question:

One must discuss the challenges and opportunities pertaining to India's pharmaceutical industry.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Briefly state the ongoing crisis across the country owing to the pandemic onset.

Body:

The question is pretty much straightforward and there isn't much to deliberate. Bring out the impact of the pandemic on the pharma industry – explain first the stress it puts on the resources of the industry, then move onto explain the avenue that it provides to Indian pharma sector to establish its global footprint.

Conclusion:

Conclude amidst all negativities it brings the Pharma Industry a chance to become a remarkable industry in the world.

Introduction:

India is the largest provider of generic drugs globally. Indian pharmaceutical sector industry supplies over 50 per cent of global demand for various vaccines. The novel coronavirus pandemic in China, with its epicentre in Wuhan, capital of Hubei province, threatens to starve India's pharma industry of key inputs. India is massively dependent on imports of active pharmaceutical ingredients (API), the bulk drugs that give medicines their therapeutic value, largely from 30-40 units in Hubei.

Body:

Indian Pharmaceutical industry:

- The Indian pharma industry has been a world leader in generics both globally and in domestic markets contributing significantly to the global demand for generics in terms of volume.
- Made-in-India drugs supplied to the developed economies such as the US, EU and Japan are known for their safety and quality.

Threats posed by Coronavirus on Indian Pharma industry:

Telegram: <https://t.me/insightsIAStips>

Youtube: <https://www.youtube.com/channel/UCpocbcX9GEIwaile4HLjwA>

Facebook: <https://www.facebook.com/insightsonindia>

▪ **Competition in drug manufacturing:**

- In recent years, India has seen increasing competition from China, which it has been able to leverage due to its inherent cost advantage, manufacturing intermediates and APIs at a cost much lower than those in India.
- This has resulted in a gradual increase in API imports from China to India and this in turn has led to killing of domestic manufacturing capacity for certain key APIs and their advanced intermediates.

BULK DRUG IMPORTS FOR MEDICINES

| Year | Total | From China |
|---------|-------|------------|
| 2014-15 | 2.77 | 1.78 (64%) |
| 2015-16 | 2.97 | 1.94 (65%) |
| 2016-17 | 2.74 | 1.83 (67%) |
| 2017-18 | 2.99 | 2.06 (69%) |
| 2018-19 | 3.56 | 2.41 (68%) |

All figures in \$billion; figures in parentheses (rounded off) are percentage of China imports in total

Source: Lok Sabha questions

• **Risks from India pharma's China linkages**

- India's large import dependence on China (nearly 70% by value) has become a significant threat to India's healthcare manufacturing and global supply chain.
- While Indian pharma players over a time period have steadily migrated up the value chain to focus on value-added formulations with higher margins, but this over dependence on China has increased the threat to the nation's health security as some of these critical APIs are crucial to mitigate India's growing disease burden.

• **Supply chain disruption for India pharma:**

- Any disruption in supply chain of APIs can result in significant shortages in the supply of essential drugs in India.
- Some of the critical APIs for high-burden disease categories such as cardiovascular diseases, diabetes and tuberculosis are listed in the National List of Essential Medicines (NLEM).

- **Major earning cuts ahead for pharma firms:**

- Edelweiss Securities says the novel coronavirus, or COVID-19, pandemic has caused severe supply-side disruptions in various sectors, earnings will be cut by 10-15%.
- Pharma as a sector has emerged as a strong contender to drive the next leg of rally, whenever it comes. In anticipation, pharma stocks have seen a huge run up in the last 10 days.
- This is not just true for India, but globally too pharma companies have performed well.
- While in the short term, most companies will bounce back from the last 5 year of underperformance, this time around, the leader will be different.

The Department of pharmaceuticals has charted out a plan to boost domestic local manufacturing of Active Pharmaceutical ingredients(API) in order to reduce its import dependence on China. The plan includes:

- Development of clusters.
- Incentives to promote indigenous manufacturing.
- Strengthen regulatory mechanism.
- Higher fee structure to reduce import.
- Single window clearance for setting up manufacturing plant.

Other measures needed:

- India's strong innovation capabilities aided partnerships would help in overcoming these problems.
- Developing our R&D sector to reduce dependency on foreign countries for raw materials
- The introduction of pharmaceutical product patents and the mandatory implementation of good manufacturing practices is the need of the hour.
- It is necessary for the Indian pharmaceutical industry to become globally competitive through world-class manufacturing capabilities, with improved quality and a higher efficiency of production, and there is a need to stress on the up-gradation of R&D capabilities.
- Training and development of human resources for the pharmaceutical industry and drug research and development should be done accordingly;
- There is also a need to promote **public-private partnership** for the development of the pharmaceuticals industry; promote environmentally sustainable development of the pharmaceutical industry; and enable the availability, accessibility, and affordability of drugs.
- Improvement in industrial practices to provide better training and support services for employees to perform their job functions.
- A drugs price index would surely make sense.
- Using multilateral organization like WTO against the illegal trade practices.
- Funding for the pharma companies might be a way to move forward.
- IPR Think Tank formed by the Government to draft stronger national IP policies.

Way forward:

- In 2015, the 'Katoch committee' put out a set of recommendations on reviving API production, which include reviving PSUs for manufacturing critical drugs such as penicillin and paracetamol.

- The setting up of mega parks with common effluent treatment plants, testing facilities and captive power plants has been mooted.
- On the financial side, the panel has suggested setting up a professionally managed equity fund for producing APIs and duty exemptions for capital goods imports.
- These facilities can have developed to world class standards, restoring the recent damage to India's reputation on the quality front.

The government's ban on Foreign Direct Investments (FDI) through the automatic route from land border sharing neighboring countries though well-intended may come with unintended consequences. Analyse. (250 words)

Reference: [The Hindu](#)

Why this question:

The spokesperson of the Chinese Embassy has said that, India's recent policy to curb opportunistic takeovers of domestic companies goes against the [World Trade Organisation \(WTO\)](#) principles.

Key demand of the question:

Explain the effect of the government's ban on Foreign Direct Investments (FDI) through the automatic route from land border sharing neighboring countries, also discuss the associated consequences.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Briefly state the context of the question.

Body:

To start with, discuss the changes in the Foreign Direct Investment (FDI) policy. Under the revised FDI policy, prior government approval is mandatory for FDI from countries which share a land border with India. The new policy states that when an entity of a country, which shares land border with India or where the beneficial owner of an investment into India is situated in or is a citizen of any such country, can invest only under the Government route. India shares land borders with Pakistan, Afghanistan, China, Nepal, Bhutan, Bangladesh and Myanmar. Discuss the possible advantages and disadvantages associated with the policy.

Conclusion:

Conclude with way forward.

Introduction:

A Foreign Direct Investment (FDI) is an investment in by foreign investors in the foreign based company. Mainly there are two types of FDI, one is Green Field Investment (a fresh company is established in a foreign country) and the other is Portfolio Investment (shares of a foreign company are purchased or ownership acquired in a foreign company). FDI under the automatic route does not require prior approval either by the government of India or by the Reserve Bank of India. Investors only require to notify and file documents in the concerned RBI office.

In a decision fraught with geopolitical and economic ramifications, the Indian government amended its foreign direct investment (FDI) policy to put a blanket ban on investments through the automatic route by entities from countries that share a border with India.

Body:

The move is seen as an attempt to ward off the threat of "opportunistic" Chinese takeover of Indian companies, whose valuations have been badly hit by the coronavirus pandemic. The curbs,

which were **already in force for investments from Pakistan and Bangladesh**, will extend to entities where Chinese citizens have “beneficial ownership” to ensure that the restrictions are not circumvented by routing investments via Hong Kong, Singapore or other countries.

Rationale behind restriction on Automatic route of FDI inflow:

- The Indian government’s move, cleared by the Union Cabinet, comes days after it emerged that the People’s Bank of China has increased its stake in HDFC Bank, the country’s largest private lender, to over 1%.
- But while the PBOC investment came through the portfolio investment route, the FDI move is more strategic and is aimed at blocking any attempt to restrict entities from across the border to acquire a significant beneficial interest.
- Stock market regulator SEBI is separately keeping tabs on investments from China and some other countries.
- The latest move by the department for promotion of industry and internal trade, the agency responsible for FDI policy, will not just impact new investments but also equity infusion in existing companies in India, where Chinese entities have equity stakes.
- Most FDI flows into India are under the automatic route, which means companies only need to inform authorities after the investment is made.
- The latest move signals a growing worry within government that China might seek to acquire Indian companies by exploiting their financial vulnerability.
- The stunning move is in stark contrast to the restraint the Indian government has exercised in not joining the global chorus of indignation over China’s attempt to conceal the outbreak of the pandemic in Wuhan — a lapse that has been widely adjudged to have been a major contributor to the enormity of the public health emergency that has already claimed over 1.5 lakh lives globally and crippled economies and markets.

Significance of restricting Investments:

- Sources said the government had explored the option of putting a general ban on foreign investment through the automatic route, but decided against it due to wariness of being seen as having turned protectionist and insular.
- Putting FDI from all countries under the approval route would have also slowed down inflows, which are critical at this time.
- With the threat of Chinese capital moving in appearing serious, the authorities decided to be specific in a turn away from the cautiousness that has defined New Delhi’s approach towards Beijing.
- Sources said that during the deliberations one school of thought had favoured a more nuanced approach, arguing that greenfield investments should be let in, but the leadership decided to go the whole hog.

Concerns raised against the move:

- The additional barriers set by Indian side for investors from specific countries violate WTO’s principle of non-discrimination, and go against the general trend of liberalisation and facilitation of trade and investment.
- The Chinese embassy not only cited its investments but also the “donations” made by Chinese companies to help fight the Covid-19 pandemic.

- As of December 2019, China's cumulative investment in India has exceeded 8 billion US dollars, far more than the total investments of India's other border-sharing countries. The impact of the policy on Chinese investors is clear.
- Chinese investment has driven the development of India's industries, such as mobile phone, household electrical appliances, infrastructure and automobile, creating a large number of jobs in India, and promoting mutual beneficial and win-win cooperation.
- Chinese enterprises actively made donations to help India fight COVID-19 epidemic.
- China also accused India of not conforming "to the consensus of G20 leaders and trade ministers to realize a free, fair, non-discriminatory, transparent, predictable and stable trade and investment environment, and to keep our markets open."
- Therefore, Without the appropriate legal and regulatory sanction, India might experience reciprocal measures.
- In order to protect India's unicorn, there is need to devise a scheme of preferential or special shares which a unicorn can issue to foreign investor.
- These shares will preserve the decision making by Indian innovators, while also providing them access to foreign capital.

Way forward:

- There is a need for India to develop new legal and institutional tools. As the ones employed by US and EU member states such as data protection laws or revised mergers and acquisitions rules, and institutional bodies.
- The Chinese have already restarted manufacturing when the rest of the world still grappling with coronavirus.
- China has several months' advantage over all other major economies and can therefore secure significant benefits.
- After each crisis in recent years, China has consolidated itself. Indian government is trying to pre-empt acquisitions.
- Countries need to strengthen their domestic capabilities to meet the Chinese challenge.

It's not just Demand and Supply, there's more to the story of Crude Oil prices, examine the factors that affect the oil prices across the world.(250 words)

Reference: [Hindustan Times](#)

Why this question:

The question is based on fall in Oil prices and what opportunities do the sudden crash in crude oil prices offers for India, How the country should make the most of a second oil windfall.

Key demand of the question:

Explain the fall in oil prices, and examine the factors that contribute to the fall apart from mere demand supply equation.

Directive:

Examine – When asked to ‘Examine’, we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Briefly talks about the impact of recent oil prices crash in general and its causes.

Body:

Explain that It's not just Demand and Supply, there's more to the story of Crude Oil prices. Four major factors help determine the price of oil: Supply & consumption, government policies, Geopolitics and

financial markets. Elaborate on the above factors with suitable examples. Discuss what opportunities the current situation holds for India.

Conclusion:

Conclude with what should be India's role amidst the oil shocks across the world and how should it benefit from it.

Introduction:

The price of Texas oil futures fell below zero dollars per barrel on Monday. In theory, and for a fleeting moment, an empty barrel of crude oil was worth more than a full one. This was a symbolic milestone, a consequence of a lack of storage and quarter-end fire sales rather than a stable market situation.

Body:

Current scenario:

- This unprecedented shift comes as the global oil markets continue to grapple with a pandemic-driven collapse in demand. At the start of 2020, a barrel of WTI cost around \$60.
- Prices had dropped swiftly because of the coronavirus, landing at around \$18 a barrel.
- Then on 20th April, they plummeted through the floor.
- WTI for May delivery settled at a negative \$37.63 — meaning traders are paying \$37.63 to get someone to accept a delivery of a barrel of oil.
- The plunging price of WTI was driven by a trading contract deadline to oil traders to sell off the current futures contract.
- And they needed buyers that are capable of receiving and storing that much oil. And, those buyers are in short supply.

Factors that affect the crude-oil price:

- **Situation prior to COVID- 19 outbreak:**
 - Even before the COVID-19 outbreak induced lockdowns across the world, crude oil prices had been falling over the past few months.
 - The reason was too much supply and too little demand.
 - In early March, Saudi Arabia and Russia disagreed over the production cuts required to keep prices stable.
 - The OPEC plus, which includes those countries which export Oil, failed to reach an agreement in March, 2020 on production cuts to arrest the falling prices in the wake of COVID-19 pandemic.
 - As a result, oil-exporting countries, led by Saudi Arabia, started undercutting each other on price while continuing to produce the same quantities of oil.
 - This was an unsustainable strategy under normal circumstances but what made it even more calamitous was the growing spread of novel coronavirus disease, which, in turn, was sharply reducing economic activity and the demand for oil.
- **Post- lockdown:**
 - With each passing day, the developed countries were falling prey to COVID-19 and with each lockdown, there were fewer flights, cars and industries etc. using oil.

- This meant that the supply-demand mismatch continued to worsen right through March and April.

Other factors:

- Similar to the stock market, which involves trading investments in various companies, people also trade in commodities at financial markets.
- People purchase “futures” — a sort of bet on whether a commodity will increase in price at a later date. Once locked into a futures contract, the buyer will get his or her commodity at that price and that date, regardless of whether the market price has changed or not.
- Laws aimed at preventing climate change will likely raise the price of energy, too.
- Taxes on petroleum products by nations can also affect consumption pattern and consequently, the prices.
- The governments continue to find ways for people to switch to power sources like wind and solar energy — and drive more fuel efficient cars — so it’s possible that the demand for oil will go down, simply because we won’t need it as much anymore.

Impact on India:

- The Indian crude oil basket does not comprise WTI — it only has Brent and oil from some of the Gulf countries — so there is no direct impact.
- But oil is traded globally and weakness in WTI is mirrored in the falling prices of the Indian basket as well.

Way forward for India:

- India should look at how it can quickly enhance its strategic reserves to benefit from the falling prices; China, for instance, is doing just that.
- India should assure future supplies as this is a good time to enter into long-term contracts.
- And finally, India should also judge how the present oil crisis will affect, for better or for worse, its long-term energy strategy.

Conclusion:

New Delhi should keep a firm eye on its long-standing goals of promoting solar and wind energy, shifting more baseload power to natural gas, and shutting its most-polluting coal-fired power plants, but it is unlikely that even the most cost-effective of these will be able to match oil prices in the short and maybe even medium term.

Discuss the significant possible contributions that the “Swamitva Yojana” can make to boost rural economy.(250 words)

Reference: narendramodi.in

Why this question:

On Panchayati Raj Diwas (April 24th), the Prime Minister of India launched ‘Swamitva Yojana’ or Ownership Scheme to map residential land ownership in the rural sector using modern technology like the use of drones.

Key demand of the question:

Explain in detail the significant possible contributions that the “Swamitva Yojana” can make to boost rural economy.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain the coming of the scheme into picture.

Body:

To start with, present a brief overview of the scheme. Explain the key features of the Yojana. Discuss the benefits of the scheme and highlight the need and significance of the scheme. Bring out challenges or concerns associated if any and suggest solutions to the same.

Conclusion:

Conclude that the new scheme is likely to become a tool for empowerment and entitlement, reducing social strife on account of discord over properties.

Introduction

On the Panchayati Raj Diwas on April 24, the prime minister launched the 'Swamitva Yojna', or the ownership scheme, to map residential land ownership in the rural sector with the help of modern technology like drones.

The scheme aimed to revolutionize property record maintenance in India was launched on the Panchayati Raj Diwas by the prime minister, who also interacted with members of Gram Panchayats across the country through video conferencing.

Body

Swamitva Yojana: Features

- **Objective:** The **Swamitva Scheme** is to provide an integrated property validation solution to the rural areas of the country.
- **Technology used:** Under this scheme now the demarcation of inhabited land of the rural area will be done according to the **latest surveying methods using drones**.
- **Implementing Agency:** The Panchayats of the rural areas were expecting the launch of this scheme for a long time. For the demarcation of inhabited land, the latest surveying method is Drone's technology.
- The scheme will be carried out in close coordination with the Central Panchayati Raj ministry, Survey of India, Panchayati Raj departments and Revenue departments of various states.

Benefits to boost rural economy

- It is expected to go a long way in **settling property rights** in rural hinterlands and likely to become **a tool for empowerment and entitlement**, reducing social strife on account of discord over properties.
- The delivery of property rights through an official document will enable villagers **to access bank finance** using their **property as collateral**.
- The residential land in villages will be measured using drones to **create a non-disputable record**.
 - It is the latest technology for surveying and measuring of land.
 - Drones will draw a digital map of every property falling within the geographical limits of a village and **demarcate** the boundaries of every **revenue area**.

- The property records for a village will also be maintained at the Panchayat level, allowing for the **collection of associated taxes from the owners**. The money generated from these local taxes will be used to build rural infrastructure and facilities.
- Freeing the residential properties including land of title disputes and the creation of an official record is likely to result in appreciation in the market value of the properties.
- The accurate property records can be used for facilitating tax collection, new building and structure plan, issuing of permits and for thwarting attempts at property grabbing.

Significance of the Scheme

- The need for this Yojana was felt since several villagers in the rural areas don't have papers proving ownership of their land.
- In most states, survey and measurement of the populated areas in the villages has not been done for the purpose of attestation/verification of properties.
- When we look at the benefits of this scheme we will have to understand this point that most people don't have the papers of their land in a rural area. In this case, the chances of disputes get increased in rural areas. This scheme will fill this gap and make the people aware of their ownership of land in rural areas.
- Swamitva Yojana is aimed to fill the above gap to provide ownership rights to people in the villages.
- As the property record of a village will be managed at the Panchayat level, the collection of taxes from the local landowners will also be done at this level only and collected money will be used for **the benefit of the local area and people**.

Challenges

- The scheme does not spell out how to resolve existing disputes on land in the rural areas.
- There is a lack of grievance redressal mechanism and villagers have no means to place their objections or bring notice to the authorities regarding any discrepancies.
- The scheme has not addressed the level of reliability of the drone survey, as accuracy rate may vary.
- Before implementation, people must be apprised of the scheme thoroughly and made aware of their rights and benefits accruing out of it.
- Without the cooperation of the people and their acceptance, the scheme will be difficult to implement.

Conclusion

The scheme will go a long way in achieving social justice and securing the lives of rural people by providing them definite legal assurance of their land ownership.

What is direct monetization of deficit? Do you think it could be a comprehensive solution for the government to prevent the looming financial crisis? Critically examine.(250 words)

Reference: [Indian Express](#)

Why this question:

The article highlights that with the economy stalled; there isn't enough money in the market for the government to borrow. It explains if it can ask the RBI to print more money and in such a case how does the process work, and what are the arguments against it.

Key demand of the question:

Telegram: <https://t.me/insightsIAStips>

Youtube: <https://www.youtube.com/channel/UCpocbcX9GEIwaile4HLjwA>

Facebook: <https://www.facebook.com/insightsonindia>

Explain the concept of direct monetization of deficit and present arguments for and against it.

Directive:

Critically examine – When asked to ‘Examine’, we have to look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgment.

Structure of the answer:

Introduction:

Briefly define the idea of direct monetization of deficit in the preset context.

Body:

Explain first the current scenario, discuss as to what triggers a demand for direct monetization.

Discuss the scope and feasibility of “Direct” Monetization by the government for Deficit Financing as an option of the last resort. Explain if India has done this in the past. Highlight the issues involved.

Conclusion:

Conclude with what should be the way forward.

Introduction

The COVID-19 spread has meant that the Indian economy, which was already slowing down rapidly over the past couple of years, has completely stalled. Most estimates suggest that India’s GDP (gross domestic product) will barely grow in the current financial year - that is, if it does not contract as is likely to be the case in most major economies of the world.

With a nationwide lockdown, incomes have fallen and so have consumption levels. In other words, the demand for goods (say a pizza or a car) and services (say a haircut or a holiday) in the economy has gone down.

Body

Direct Monetization of Deficit

- It is a scenario where the government deals with the RBI directly, bypassing the financial system and asks it to print new currency in return for new bonds that the government gives to the RBI.
- Now, the government would have the cash to spend and alleviate the stress in the economy — via DBT to the poor or starting social and capital expenditure etc.
- In lieu of printing this cash, which is a liability for the RBI (recall that every currency note has the RBI Governor promising to pay the bearer the designated sum of rupees), it gets government bonds.
- Such bonds are an asset for the RBI since such bonds carry the government’s promise to pay back the designated sum at a specified date.
- And since the government is not expected to default, the RBI is sorted on its balance sheet even as the government can carry on rebooting the economy.

Why is Direct Monetization needed?

- **Lack of Demand:** The income levels have fallen as the economy has come to a stand still.

- This in turn has led to fall in the consumption levels. In other words, the demand for consumer goods and services in the economy has gone down.
- **Financing the fiscal deficit:** To reboot the economy, government has to come up with a stimulus package for various sector. And as the expenditure for fighting the pandemic was unforeseen in the budget, these packages will cause fiscal slippage and needs to be financed through various mechanisms. Direct monetization is one of the ways this can be done.
- **No credit available for borrowing:** For the government to borrow the money, the market should have it as savings. Data show that savings of domestic households have been faltering and are barely enough to fund the government's existing borrowing needs.
- **Receding foreign capital:** Foreign investors, too, have been pulling out and rushing to "safer" economies like the US, and are unwilling to lend in times of such uncertainty.

Feasibility of Direct monetization

- **Used in the past:** Until 1997, the RBI "automatically" monetized the government's deficit. In 1994, Manmohan Singh (former RBI Governor and then Finance Minister) and C Rangarajan, then RBI Governor, decided to end this facility by 1997.
- Recently C Rangarajan had said that monetization of the deficit was inevitable. Such a large increase in expenditure could not be managed without monetization of government debt.
- Countries like the UK have decided to tread this path. The Bank of England extended direct monetization facility to the UK government.
- Ideally, this tool provides an opportunity for the government to boost overall demand at the time when private demand has fallen, like it has today with enough caution.
- Good inflation is also needed. With a lockdown, the most immediate issue that policymakers have to contend with would be a dramatic fall in inflation.
 - That has deleterious impact on taxes, wages and ability of the government to take on more debt.
 - The risk of very low inflation (no-one is still talking about deflation in India yet) is as real as the one of high inflation.
 - "Printing money" ensures a backstop to ensure a certain amount of inflation in the economy – enabling the government to inflate away at least part of the new debt it is taking on to provide a safety net for the economy.

Issues with Direct Monetization

Direct monetization of deficit is a highly contested issue. Ex-RBI Governor Subbarao cautioned that India must remember that the balance of payments crisis in 1991, and a near-crisis in 2013, were, at heart, a result of extended fiscal profligacy.

- **Inflation:** Government expenditure using this new money boosts incomes and raises private demand in the economy.
 - With RBI printing a lot of money to buy G-Secs, money supply will shoot up and engender an inflationary spiral.

- Thus, it fuels inflation and if the government doesn't stop in time, more and more money floods the market and creates high inflation.
- **Data lag:** Inflation data is revealed with a lag, it is often too late before governments realise they have over-borrowed. Higher inflation and higher government debt provide grounds for macroeconomic instability
- Another oft-quoted risk of DM is **external vulnerability**. The rationale is that aggressive DM could devalue the currency, causing foreign investors to lose confidence and pull out money, putting the existing fiscal financing plan at risk.
- The other argument against direct monetizing is that governments are considered inefficient and corrupt in their spending choices — for example, **whom to bail out and to what extent**.

Conclusion

Consistency in policymaking is often touted as a virtue. But in extreme scenarios more than otherwise, consistency is merely a hobgoblin of mediocre minds. We need inspirations beyond mediocrity to kick-start India back into action. Monetization is perhaps the sharpest inspiration in the quiver today.

Major crops cropping patterns in various parts of the country, different types of irrigation and irrigation systems storage, transport and marketing of agricultural produce and issues and related constraints; e-technology in the aid of farmers Can the ongoing COVID-19 crisis be converted into an opportunity for reforming the agri-marketing system in the country? Give reasons in support of your arguments.(250 words)

Reference: [Indian Express](#)

Why this question:

The article authored by Ashok Gulati brings a different perspective of the effects of COVID-19 and in what way India can use it as an opportunity to reform its agri markets.

Key demand of the question:

Explain in what way the ongoing COVID-19 crisis can be converted into an opportunity for reforming the agri-marketing system in the country.

Directive:

Give reasons – Weigh up to what extent something is true. Persuade the reader of your argument by citing relevant research but also remember to point out any flaws and counter-arguments as well. Conclude by stating clearly how far you are in agreement with the original proposition.

Structure of the answer:

Introduction:

Briefly explain the current situation across the world.

Body:

To start with, explain the crisis that agriculture sector is facing owing to the COVID-19 effects. Explain what needs to be done to put the agri-system on an efficient path. Take hints from the article and list down the suggestions. Discuss the possible challenges involved while suggesting solutions for the same.

Conclusion:

Conclude with a futuristic approach for the Agri system of the country.

Introduction:

The significant disruption in supply chains as a result of the lockdown has led to farmers being stuck with a large amount of produce, especially of perishables like milk, fruits and vegetables, flowers and even poultry meat and eggs. Due to this glut, farm prices are collapsing, pushing farmers into destitution. Many of them are dumping milk and vegetables on the roads. With the procurement season for rabi crops having started, the mandi system will choke, and social distancing will go for a toss if immediate steps are not taken to organise procurement operations in an orderly manner. The wisdom lies in converting this crisis into an opportunity for reforming the agri-marketing system.

Body:

Hurdles for free movement and trade in agri produce due to lockdown:

- The supplies are plentiful but the shutting down of hotels, restaurants and catering businesses has led to demand destruction from institutional buyers.
- With abundant availability and demand now largely restricted to direct household consumption, there could be scope for panic buying and hoarding and people going without food.
- Inter-state movement restrictions and arbitrary actions by local authorities to enforce the lockdown — including closing down produce collection centres and warehouses of organized retailers.
- The links in the chain connecting farmers to consumers have broken down, in turn opening up arbitrage opportunities for unscrupulous speculators
- Agriculture is a 'state subject' and a large part of investment as well as regulatory progress is happening at the state level. The lack of coordination between the states at this time of crisis would be a debacle.
- **Limited reach of mandis:** Also, this procurement system has failed to cover the entire country evenly (back of the envelope calculation suggests that on an average, a farmer needs to travel 12 kms to reach the nearest mandi and more than 50 kms in NE India) while according to the recommendations by National Farmers Commission, availability of markets should be within a 5 km radius.
- **Inadequate infrastructure for storage:** The Planning Commission has recently estimated the gap between agri-warehousing supply and demand at 35 mn MT.
- **Lack of cold storage infrastructure:** India's current cold storage capacity at 25 MT is barely sufficient for 10% of fruit and vegetables produced in the country.

Measures to reform the agri-marketing system in country:

- Abolish/reframe the APMC Act and encourage direct buying of agri-produce from farmers/farmer producer organisations (FPOs). The companies, processors, organised retailers, exporters, consumer groups, that buy directly from FPOs need not pay any market fee as they do not avail the facilities of APMC yards.
- The warehouses can also be designated as markets, and the warehouse receipt system can be scaled up. The private sector should be encouraged to open mandis with modern infrastructure, capping commissions.
- Futures trading should be encouraged by allowing banking finance to hedge for commodity price risks.
- Promote e-NAM through proper assaying and grading the produce and setting up dispute settlement mechanism; rope in major logistics players for delivery of goods.
- Procurement must be staggered through coupons and incentives that give farmers an additional bonus for bringing produce to the market after May 10, or so.

- The amount provided under PM Kisan should be increased from Rs 6,000 to at least Rs 10,000 per farming family to partially compensate them for their losses.

Conclusion:

Post crisis, India must ask for fundamental reforms in the UN System, including the WHO, making it more transparent, competent, and accountable.

Policy action is the need of the hour to bridge the growing gap between irrigation potential creation and that actually utilized with path-breaking command area development. Comment. (250 words)

Reference: [Economic Times](#)

Introduction:

A recent ministry of earth sciences (MoES) report says that large parts of the country, including Uttar Pradesh, Bihar and West Bengal, have been witnessing “significantly decreasing trends” in rainfall patterns over the last three decades. It suggests pressing need to boost proactive policy to better manage water resources both at the Centre and in the states.

Body:

Present Water Crisis in India:

- Water levels in India’s major reservoirs have fallen to 21 per cent of the average of the last decade.
- Fifty-four per cent of the country’s groundwater is declining faster than it is being replenished.
- There is a crippling dependence on monsoon rains to replenish most of India’s key water sources— underground aquifers, lakes, rivers and reservoirs.
- Close to half the country, about 600 million people, face severe scarcity year after year.
- A June 2018 Niti Aayog report forecasts water demand will be twice the present supply and India could lose up to 6 per cent of its GDP.
- India’s water table is falling in most parts; there is fluoride, arsenic, mercury, even uranium in our groundwater.
- The groundwater and sand extraction from most river beds and basins has turned unsustainable.
- Tanks and ponds are encroached upon.
- Dug-wells and borewells are constructed with alarming impunity to slide deeper and deeper to suck water from greater depths.
- Water is being diverted from food-crops to cash-crops; livelihoods to lifestyles; rural to urban— mismanagement is a bigger reason for the drought.
- Water shortages are hurting India’s ability to produce power and 40% thermal power plants are in areas facing high water stress, a recent World Resources Institute report says
- Not only farmers, urban dwellers in cities and towns across India are also staring at a never seen before drinking water scarcity.
- Residents in the arid Thar desert of Rajasthan are spending Rs 2,500 to buy 2,500 litres of water which they share with their cattle.

Policy actions needed:

- The way ahead is to step-up recharge of aquifers and groundwater resources, even as we better allocate resources for surface irrigation systems and their maintenance.

- The rational pricing of water for irrigation brooks no delay. In parallel, the reasonable rational pricing of urban water supply is required to modernise and augment the network.
- Further, we need to shore up resources for water treatment and reuse. Note that only about 2% of urban centres have both sewerage systems and sewage treatment plants. This need to very substantially change going forward.
- The rejuvenation of rivers, as envisaged in the National Water Framework Bill, needs legislating. The destruction of catchment areas and river flood-plains have adversely affected river flows nationally, which needs reversing.
- We need concrete steps to reverse the build-up and consequent destruction of catchment areas and river flood-plains, to augment discharge channels and boost water flow to effectively prevent flooding, including in urban areas.

Conclusion:

There is a need to modernise the regulatory framework for accessing groundwater soon after massive expansion in mechanical pumping led to the realisation that recharge could not keep pace with use.

A special plan like the Marshall Plan of USA in 1948 is the need of the hour to address the agrarian distress amidst the ongoing crisis. Comment.(250 words)

Reference: [Indian Express](#)

Why this question:

The author talks about the agrarian reforms that the country needs in the current crisis hours and in what way we require Marshall plan like that of USA to address the situation.

Key demand of the question:

Explain the factors responsible for the ongoing agrarian crisis; discuss what needs to be done to address the situation.

Directive:

Comment– here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

Explain what Marshall plan of USA in 1948 was.

Body:

To start with, highlight the agrarian problems the country is facing currently. One can present the case study of eastern India as suggested in the article. List down the challenges in detail. Take hints from the article and explain what can be done and what lessons can be taken from the Marshall plan of USA,1948. Suggest solutions to address the scenario.

Conclusion:

Conclude with way forward.

Introduction

In the context of today's economy, under siege because of the coronavirus pandemic, what matters is not how big a country's GDP is or how fast it has been growing; the real challenge is how best and how quickly a country can bounce back to a growth rate of 7-8 per cent per annum.

Our survival is dependent on agriculture and a good harvest depends on quality seeds delivered to farmers by the seed sector, both public and private. As we are in the midst the coronavirus crisis, it is imperative that good seeds and other farm inputs reach farmers in time for the kharif season.

Body

State of Economy amidst Covid-19 pandemic

- The IMF's projections for GDP growth for this year seem to be either in the negative or below 2 per cent for almost all major countries of the G-20 group.
- India could do a little better compared to the other BRICS nations, but its growth will most likely be below 2 per cent.
- Many experts reckon that India could also go into negative GDP growth this year, if it does not reboot the economy properly and in time.
- The all India relief package of Rs 1.7 lakh crore announced by the central government earlier, which is about 0.8 per cent of the country's GDP, is too small to reboot the economy.
- The lockdown has choked off almost all economic activity. In urban areas, leading to the widespread loss of jobs and incomes for informal workers and the poor.
- Estimates by the Centre for Monitoring Indian Economy show that unemployment shot up from 8.4% in mid-March to 23% in the first week of April.
- In urban areas, unemployment soared to 30.9% as of April 5. The shutdown will cause untold misery for informal workers and the poor, who lead precarious lives facing hunger and malnutrition.

What was the Marshall Plan 1948?

- It was a call for a comprehensive program to rebuild Europe.
- Fanned by the fear of Communist expansion and the rapid deterioration of European economies in the **winter of 1946–1947**, Congress passed the Economic Cooperation Act in March 1948 and approved funding that would eventually **rise to over \$12 billion** for the rebuilding of Western Europe.
- The Marshall Plan generated a **resurgence of European industrialization** and brought extensive investment into the region.
- It was also **a stimulant to the U.S. economy** by establishing markets for American goods.
- The Marshall Plan also institutionalized and legitimized the concept of U.S. foreign aid programs, which have become an integral part of U.S. foreign policy.

Agrarian distress due to pandemic

- Preliminary reports show that the non-availability of migrant labor is interrupting harvesting activities, particularly in northwest India where wheat and pulses are being harvested.
- There are disruptions in supply chains because of transportation problems and other non-availability of demand for farm produce. Although farm produce were essential goods, smooth transport of these were not facilitated.
- Prices have declined for wheat, vegetables, and other crops, yet consumers are often paying more.
- Media reports show that the closure of hotels, restaurants, sweet shops, and tea shops during the lockdown is already depressing milk sales.
- Meanwhile, poultry farmers have been badly hit due to misinformation, particularly on social media, that chicken are the carriers of COVID-19.

Need for stimulant to India to fight agrarian distress

The government has correctly issued lockdown guidelines that exempt farm operations and supply chains. But implementation problems leading to labor shortages and falling prices should be rectified.

- Keeping supply chains functioning well is crucial to food security. It should be noted that 2 to 3 million deaths in the Bengal famine of 1943 were due to food supply disruptions—not a lack of food availability.
- Farm populations must be protected from the coronavirus to the extent possible by testing and practicing social distancing.
- Farmers must have continued access to markets. This can be a mix of private markets and government procurement.
- Small poultry and dairy farmers need more targeted help, as their pandemic-related input supply and market-access problems are urgent.
- Farmers and agricultural workers should be included in the government's assistance package and any social protection programs addressing the crisis.
- As lockdown measures have increased, demand has risen for home delivery of groceries and E-commerce. This trend should be encouraged and promoted.
- The government should promote trade by avoiding export bans and import restrictions.

Conclusion

Hence besides chalking new plans and announcements, this is the right time to take pragmatic steps to address the fault lines in India's agricultural and farming sector, to bring rural prosperity and dispel agrarian distress.

Issues related to direct and indirect farm subsidies and minimum support prices; Public Distribution System- objectives, functioning, limitations, revamping; issues of buffer stocks and food security; Technology missions; economics of animal-rearing.

Do you agree with the view that the covid-19 pandemic presents a window to second white revolution for India? Give reasons in support of your arguments.(250 words)

Reference: [Financial Express](#)

Why this question:

The Author explains in detail the possible opportunities that the current pandemic brings with it with respect to the dairy farming in the country.

Key demand of the question:

Explain the prospects for second white revolution brought out by the COVID-19 pandemic to India.

Directive:

Give Reasons – Weigh up to what extent something is true. Persuade the reader of your argument by citing relevant research but also remember to point out any flaws and counter-arguments as well. Conclude by stating clearly how far you are in agreement with the original proposition.

Structure of the answer:

Introduction:

In short explain the effect of the pandemic in general on the agriculture sector and otherwise.

Body:

The body of the answer must explain How COVID-19 could benefit the dairy industry. Take hints from the article and present points in favour of your argument like – Covid-19 pandemic has thrown up the real possibility for our dairy industry to benefit as large sections of consumers may shift from meat-based to dairy-based protein. Covid-19 crisis has witnessed reverse migration of labour force from urban to rural areas leading to social disruptions. On the positive side, we can look at this as an

opportunity; these workers can be encouraged and incentivized to join their family agriculture/dairy farms etc.

Conclusion:

Conclude on a positive note that it's the right time to encash the opportunity and help and aid our farmers with a new ray of hope.

Introduction:

Dairy industry has proved to be more resilient than many other sectors in terms of the extent of supply chain disruptions during the COVID-19 lockdown. Millions of our animal-owning households, the majority being smallholders, particularly those connected to producer-centric institutions continued to milk their cows and buffaloes, and sell the surplus to the village milk collection centres. Milk was then pooled, cooled, and transported to processing centres where it was pasteurised, packaged and dispatched to thousands of marketing outlets, finally finding its way to millions of homes.

Body:

Sustenance of dairy industry during CoVID-19:

- To enhance the marketing of milk and milk products, many dairy organisations, initiated home delivery of milk and milk products through mobile carts, vans, e-commerce, etc.
- All these measures helped stabilise milk sales, opening up opportunities to use e-commerce.
- Many smart and progressive dairy farmers converted their surplus milk into khoa, paneer, ghee, etc, and sold it to the neighbourhood markets through informal channels.
- The US is contemplating to purchase milk, convert it into commodities which could be used as international humanitarian aid.
- All these measures helped sustain dairy industry.
-

Potential of White Revolution 2.0:

- Post-liberalisation and Milk and Milk Products Order (2002) was abolished, dairy businesses observed a radical shift toward a strategic product diversification towards functional and traceable foods like nutrition-based health drinks, packaged milk products (such as paneer), and frozen/probiotic products and so on.
- Market structure, conduct, and performance has dramatically changed post 2000s. Besides the established cooperative federations like Amul, other state cooperative federations and multinationals (namely, Nestle, Danon, and Lactalis) are aggressively harnessing the untapped business potential.
- White revolution 2.0 can strengthen the scope of vertical integration between cattle feed industries, dairy machinery firms, producer cooperatives unions, state marketing federations, advertising and marketing firms, logistics and distribution agencies.
- The dairy industry in India is unique. With six lakh villages housing about 90 crore people, dairying is not just a large economic activity but also an integral part of our social and cultural heritage
- Can help small farmers to reduce dependence on crop sales

- Can increase source of income of farmers in low yielding areas like Marathwada, Bundelkhand etc
- India is surrounded by countries and regions that are milk-deficient, such as the Middle East, South Asia and Southeast Asia.
- There is ample scope for export of value-added milk products to Bangladesh, China, Singapore, Thailand, Malaysia, Philippines, Japan, the UAE, Oman and other gulf countries, all of which are located close to India.
- At present, the population of South Asia alone is growing at 1.3 per cent a year; it is likely to be 2.2 billion by 2050. This presents an opportunity for India's dairy industry

Challenges to White Revolution 2.0:

- The Indian cows and buffaloes are generally low yielding and non-descript because of the lack of healthy cattle-feed and fodder, tropical heat and diseases.
- Despite lack of water and gradually declining arable land, dairy farming is on the rise.
- Free trade agreements, or FTAs, for instance, will allow EU government-subsidized products to be imported from Europe with little entry barriers. This will pose a big challenge to cow-farmers.
- Due to unhygienic production, handling conditions and high temperatures, the quality of milk is adversely affected.
- Because of inadequate marketing facilities, most of the marketable surplus is sold in the form of ghee which is the least remunerative of all milk products.

Measures needed:

- India may consider reducing GST on ghee and milk fat, from 12% to 5% to bring it at par with the GST rate for SMP. This has been a long-standing demand of the dairy industry and will ultimately benefit milk producers, increase rural incomes, spur demand and hasten economic recovery.
- Increase in the market share depends on how dairy firms' capabilities and their resources are utilised given the opportunities and threats emanating from emerging markets economies.
- Contract/corporate dairying and emerging global dairy trade are required to rope in dairy supply chains stakeholders in order to expand their outreach and "on-the-go" product positioning into the target segment.
- Digital technology-enabled dairy firms need to identify their compatible partners and competitors for co-creation through product-process innovation via relationship/value-based marketing.
- Freshness in milk, and convenience to store milk or milk products can be a technology innovation brought in by large dairy firms in association start-ups.
 - Education and Training at Panchayat level for small and medium size farmers
 - Subsidizing cattle production and encouraging cattle markets
 - Facility of logistics for produced milk
 - Improved Veterinary facility specially in artificial insemination of cattle

- Encouraging private sector firm to procure dairy produced at rural level
- Low interest loans for small and medium scale farmers for cattle purchase
- Encouraging rural women to take up animal husbandry
- Insurance of cattle against diseases like Anthrax, Foot and Mouth, Peste des Ruminantes, etc.
- Nurture dairy entrepreneurs through effective training of youth at the village level coupled with dedicated leadership and professional management of farmers' institutions.
- Agricultural practices, sanitation, quality of drinking water & fodder, type and quality of pipelines - all of these need to be aligned to the goal of healthy milk

Conclusion:

Covid-19 pandemic has thrown up the real possibility for our dairy industry to benefit as large sections of consumers may shift from meat-based to dairy-based protein. Covid-19 has made people more aware of the need to adopt a healthy diet. Covid-19 crisis has witnessed reverse migration of labour force from urban to rural areas leading to social disruptions. On the positive side, we can look at this as an opportunity; these workers can be encouraged and incentivized to join their family agriculture/dairy farms.

Food processing and related industries in India- scope and significance, location, upstream and downstream requirements, supply chain management.

“Supply chain challenges in a situation of a long nationwide lockdown are immense, and complex.”, discuss the possible role that e-commerce can play in such a situation.(250 words)

Reference: [Financial Express](#)

Why this question:

The question is based on the Supply chain challenges that the country is witnessing amidst the lockdown.

Key demand of the question:

The answer must discuss the role of e-commerce in the present times of lockdown and the prospects that it brings with it to handle and manage the supply chain constraints.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly define what constitute supply chain, and what are the constraints being witnessed with respect to it in the current times.

Body:

Explain that – Supply chain challenges in a situation of a long nationwide lockdown are immense, and complex. While maintaining the flow of essential supplies, it is equally important that people

across the country have access to them, preferably while remaining within their homes. E-commerce can play a big role in this regard, and keep the supply chain efficiently functioning. Take hints from the article and list down the positives.

Conclusion:

Conclude that with suitable logistical linkages and state support, e-commerce can help ensure maintenance of supply chains and facilitating access to essential goods.

Introduction

Unprecedented circumstances are upon us. As covid-19 mutates across the sphere, with governments unsure and citizens fretting, there is little doubt over the scale of the challenge that lies ahead. With a worldwide recession looming, the pandemic will test our collective resilience.

At this time, **supply chain challenges** in a situation of a long nationwide lockdown are immense, and complex. While maintaining the flow of essential supplies, it is equally important that people across the country have access to them, preferably while remaining within their homes. The elderly, and those vulnerable—persons having diseases like diabetes, heart problems—have to be kept securely inside the “cocoon” of their homes to ensure social distancing, while ensuring their needs, including medicines, are being met. Delivery right to their homes, or at their doorsteps may be critical during the pandemic.

Body

Supply Chain Management

- Supply chain management is the **management of the flow of goods and services** and includes all processes that **transform raw materials into final products**.
- It involves the active streamlining of a business’s supply-side activities to maximize customer value and gain a **competitive advantage in the marketplace**.
- SCM represents an effort by suppliers to develop and implement supply chains that are as efficient and economical as possible.
- Supply chains cover everything **from production to product development** to the information systems needed to direct these undertakings.
- Maintenance of a supply chain is a complex process, and can be interrupted, or clogged in many ways—manufacturing shutdowns, transport restrictions, speculative behaviour and panic buying, issues in last-mile delivery, etc.
- During the crisis, this becomes even more important with regard to **essential products**.

Role of E-commerce in handling supply chain challenges

E-commerce can play a big role in this regard, and keep the supply chain efficiently functioning.

- With suitable logistical linkages and clarity of respective roles, and support from government agencies, it can **facilitate coordination between local FMCG enterprises and traditional kirana outlets**.
- E-commerce platform can dynamically connect centers of supply and demand with modern tools of technology. **Eg : In case of everyday essentials such as dairy and groceries, Big-basket has emerged a huge player in providing linkage between supplier and consumer.**
- **Employment Sustenance:** It can sustain and maintain, if not create, jobs at the same time. It is reported that Flipkart, India’s largest e-commerce company, is already in discussion with several kirana aggregators to start such pilots.

- **Ensuring social distancing:** E-com delivery could be scaled up for **doorstep delivery in affected areas**, and complement their mutual efforts. In hotspots and red zones of the country, door delivery of services can flatten the curve by avoiding people to step out even for essentials.
- **Delivering Food:** An online platform like Zomato is being used to connect with brick-and-mortar restaurants to deliver food. This way, it is not only helping local businesses survive, but also providing a link for food to those who may not be in a position to cook.
- **Past Precedence:** It was the SARS virus of 2003 that impelled the enormous growth of e-commerce in China. The emergence of Alibaba, JD.com, Taobao, Tmall, etc, witnessed explosive growth of e-commerce, on-demand, ultramodern delivery, as well as logistics infrastructure which overtook global trade and commerce.
- **Employment and empowerment:** These had an overall positive effect by generating millions of jobs (estimated 30 million in China) and sources of livelihood for micro-entrepreneurs who found a way to market. It also had a **significant impact for women**, whose movement is sometimes particularly constrained by cultural circumstances.

Way-forward

Among the areas for improvement are:

- **End-to-end stock visibility:** Organizations need to know what they have in their warehouses, in store, what is selling at what time, and where, so they can quickly react to changing conditions and customer needs. Having unified inventory visibility across channels in a single database is crucial. This not only enables organizations to make rapid and agile replenishment and stock transfers — it also means they avoid overspend on inventory.
- **Complex supplier monitoring:** Understanding how suppliers' and their subcontractors' locations are spread out globally, and knowing which products pass through those sites, is critical to manage any disruptions. This enables organizations to quickly predict how the supply chain will be impacted over the coming weeks, giving them time to immediately execute mitigation strategies.
- **Analytics and artificial intelligence:** Deploying tools infused with strong analytics capabilities will enable organizations to get ahead of demand, respond to changing market conditions, improve demand forecast accuracy, and suggest better allocation and replenishment strategies. By combining internal and external data, supported by AI, applications can work on scenario analysis and "what-if" conditions, creating complex models to plot the best course of action.
- **Process automation:** Workflow automation leads to even faster and more agile replenishment processes. For example, systems that provide low-stock alerts can automatically order goods for a particular store quickly and cost-effectively from the right location.

Conclusion

There will be several innovations in online learning, pharmaceuticals, medical research, and various existing and new applications of e-commerce. It was the Second World War that gave rise to the big economic powers. This war with coronavirus, which has thrown a new gauntlet, can be a huge opportunity for us. There is no doubt we shall rise up to it as in the past, during earlier wars, and the brainpower of Indian millennials, which has been demonstrated around the world, will bring out new solutions to the various current problems.

Discuss the possible role that Geographical indication (GI) tags play in Rural Development of the country.(250 words)

Reference: [The Hindu](#)

Why this question:

Bangalore blue grape is a variety of fox grape grown in districts around Bengaluru, Bengaluru rural, Chikkaballapur and Kolar districts. It has been given the Geographical Indication (GI) status in 2013. Almost all the growers of Bangalore Blue grapes are now in dire straits as their crops have started drying up with no buyers due to the COVID-19 lockdown.

Key demand of the question:

Explain the role of Geographical indication (GI) tags play in Rural Development of the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly define what GI is.

Body:

A GI or Geographical Indication is a name or a sign given to certain products that relate to a specific geographical location or origins like a region, town or country. Using Geographical Indications may be regarded as a certification that the particular product is produced as per traditional methods, has certain specific qualities, or has a particular reputation because of its geographical origin. List down the positives of the GI. Discuss the role of GI in Rural Development – Geographical indications are mostly traditional products, produced by rural communities over generations that have gained prominence on the markets for their precise qualities. Some benefit are – The supply chain is structured around a common product reputation Increased and stabilized prices for the GI product Distributed through all the levels of the supply chain adds value Natural resources can be preserved on which the product is based Preservation of traditions and traditional expertise.

Conclusion:

Conclude with way forward.

Introduction:

A geographical indication (GI) is a name or sign used on products which corresponds to a specific geographical location or origin. It acts as a certification that the product possesses certain qualities, is made according to traditional methods, or enjoys a certain reputation.

Since the COVID-19 lockdown came into force, coupled with several other issues, meant there are no takers for many GI tag crops like Bangalore Blue variety of Grapes, Dilkush variety of seeded green grapes and many more GI tag products.

Body:

Laws governing the GI tag:

- Under Paris Convention for the Protection of Industrial Property, GIs are covered as an element of IPRs.
- GI is governed by WTO's Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS).
- In India, GI tag is governed by Geographical Indications of Goods (Registration and Protection Act), 1999.

- This Act is administered by Controller General of Patents, Designs and Trade Marks, who is also Registrar of Geographical Indications.

Role that Geographical indication (GI) tags play in Rural Development of the country:

- GI tag helps the producers to differentiate their products from competing products in the market.
- It enables the producers to build a reputation and goodwill around their products, which often fetch a premium price.
- The products help in export earning, promotion of tourism, cultural heritage and national identity.
- For example, Kanjeevaram silk sarees and Pochampally Ikat contribute to exports and popularity.
- GIs have great potential to play a major role in trade between countries.
- Legal protection to GIs protect livelihoods and encourage employment generation.
- Owing to the premium prices that many GIs command today, there is a possibility of preserving many traditional skills.
- Benefit to the rural economy by improving the incomes of farmers or non-farmers
- GI allows genuine producers to capture the market and creates entry barriers for fakes

Concerns / Challenges:

- The special treatment to wines and spirits in TRIPS Agreement appears to be developed country-centric. Developing countries, including India, seek the same higher level of protection for all GIs as was given under TRIPS for wines and spirits.
- The battle for GI tag between states. For instance, the previous row between West Bengal and Odisha over the ownership of Rasogolla
- False use of geographical indications by unauthorized parties is detrimental to consumers and legitimate producers.
- Cheap Power loom saris are sold as reputed Banarasi handloom saris, harming both the producers and consumers
- Such unfair business practices result in loss of revenue for the genuine right-holders of the GI and also misleads consumers.
- Protection of GI has, over the years, emerged as one of the most contentious IPR issues.

Way forward:

- The benefits of GI tag are realised only when these products are effectively marketed and protected against illegal copying.
- Effective marketing and protection requires quality assurance, brand creation, post-sale consumer feedback and support, prosecuting unauthorised copiers, etc.
- For internationally recognised products like Darjeeling tea, international protection is of crucial importance.
- Legal protection to GIs also extends to protection of traditional knowledge and traditional cultural expression contained in the products.
- Hence Intellectual Property is a power tool for economic development and wealth creation particularly in the developing world.

- GIs have the potential to be our growth engine. Policy-makers must pay a heed to this and give Indian GI products their true reward.

Give an account of distribution of sugar industry in India. Also, highlight the problems plaguing the sugar sector in the contemporary times.(250 words)

Reference: [Indian Express](#)

Why this question:

The article brings to us insights in the sudden dip of sugar prices besides the price crash in oil that the world is witnessing.

Key demand of the question:

The student must account for distribution of sugar industry in India in detail and highlight the problems plaguing the sugar sector in the contemporary times.

Directive:

Account – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In short explain the importance and relevance of sugar industry in India owing to the agricultural nature of the economy.

Body:

India is the world's largest producer of sugarcane and cane sugar and contributes about 8% of the total sugar production in the world. At present, this is the second largest agro-based industry of India. Factors responsible for distribution of sugar industry use a map of India to depict the distribution and add value to your answer. Discuss the problems faced by the sugar industry in India, present the factors of the contemporary times too such as the effect of oil price crash amidst the COVID-19 fear.

Conclusion:

Conclude by suggesting solutions as to what needs to be done to overcome these challenges.

Introduction:

India is the **second largest producer of sugar** (17.1%) in the world after Brazil. Within India, **Uttar Pradesh (36.1%), Maharashtra (34.3%) and Karnataka (11.7%)** are the three largest producers. Sugar production in India has increased from 24.8 million tonnes in 2015-16 to 32.25 million tonnes in 2017-18 and is expected to touch 35.5 million tonnes in 2018-19. But the domestic demand remains stagnant at around 25 million tonnes. More than 50 million farmers engaging in sugarcane cultivation in over four million hectares of land (with over five lakh employees in sugar mills). Increasing mismatch has further depressed sugar prices, resulting in increasing sugar arrears.

Body:

Distribution of sugar industry in India:

A high yield sugarcane variety, India witnessed bumper harvests in the last 3 seasons, but sugar prices have fallen and sugarcane farmers have been incurring heavy losses.

The issues faced by sugarcane farmers in the country are

- **Coronavirus pandemic:**
 - The closure of restaurants, weddings and other social functions not taking place, and people avoiding ice-creams and sweetened cold beverages that might cause throat infections.
 - The impact of coronavirus-induced lockdowns on out-of-home consumption and institutional (as opposed to direct household) demand for sugar is obvious.
- **Multiple Prices:**
 - Fixation of **Fair Remunerative Price** is another bone of contention between the Centre and sugar mills. The **Centre decides FRP annually** and the **states** can hike it by issuing a **state advisory price** or SAP. But **mills want the price of sugarcane to be linked to the price of sugar**.
 - The higher FRP and SAP poses a grave threat to groundwater levels, the depletion of which is already a grim ecological catastrophe in India.
- **Glut in Production:**
 - New seed variety, **CO-0238**, the country has witnessed bumper harvests in the last three seasons, particularly in 2017-18.

- But sugar prices have fallen because of the demand-supply mismatch and sugarcane farmers have been incurring heavy losses.
- 36 MMT of sugar, against consumption of 26 MMT, is being produced since 2018, which involves high risks like high storage costs and spoilage.
- **Unpaid dues to farmers:**
 - The sugar production by mills also went up across the country, due to which the sugar prices plummeted so much that the sugar mills in India cumulatively owe Rs 22,000 crore to farmers for cane supplied in 2017-18.
- **Mismanaged policy:**
 - In December 2009, the government announced its National Policy on Biofuels, which called for blending petrol with 5 per cent ethanol.
 - In 2015, the target was raised to 10 per cent. But this was never achieved. Brazil, the world's biggest sugarcane producer, depends on ethanol, and not sugar, as main revenue source from sugarcane and blends 27 per cent ethanol with petrol.
 - There are several impediments to the solutions proposed by the government which include sugar subsidies, exporting excess production of sugar, production of ethanol from sugarcane to use in cars and buying excess sugar and hoarding it as buffer stock
- **Delay in payment of late fees:**
 - After the crushing season is over, the mill is supposed to transfer the money to farmers' bank accounts within 14 days, failing which it should pay 15 per cent interest annually on the amount, says the Union government's Sugarcane Control Order of 1966. But mills rarely pay on time.
- **Infrastructure issues:**
 - Sugarcane is a **weight-losing crop** which needs to be crushed at the earliest from time of harvest.
 - The **poor connectivity, lack of transportation facilities and distant sugar-mills** cause huge losses to farmers due to decline in quality of sugarcane.
- **Miscalculations:**
 - In October 2016, Uttar Pradesh announced the average sugarcane yield estimates for every district for 2017-18. These estimates are the basis on which the mills buy sugarcane. Farmers say that these estimates have turned out to be much less than the actual yield.

Way forward:

- **Rangarajan committee (2012)** proposed **decontrol of sugar industry and linking sugarcane prices with market price of sugar to account for this structural imbalance.**
- Based on the report, Commission for Agricultural Costs and Prices (CACP) recommended a hybrid approach of fixing sugarcane prices, which involved fair and remunerative price (FRP) or floor price and revenue sharing formula (RSF). Under this approach farmers' revenue from sugarcane would be higher if the price of sugar and by-products is high.

- This is similar to many other committees formed by the government to recommend the sugar industry decontrol. Committees under **Mahajan (1998), Tuteja (2004), Thorat (2009) and Nandakumar (2010) had similar recommendations.**
- Ease the market control of government on export and import. The move is to help India (17% of world production) to enable its exports (only 4% of world export), but leaving it all to the market is risky.
- Do away with minimum distance between mills to enable competition.
- The new **national policy on biofuels 2018**, expands the scope of raw material for ethanol production by allowing use of Sugarcane Juice.
- Policy modifications to increase the ethanol blending vis-à-vis the foreign countries like Australia which has 85% blending. Better prices for ethanol can also help in export of the same.
- **To diversify crops and ensure that sugarcane production falls.** This requires long-term investment, and the government will have to encourage farmers to cultivate crops like pulses and oilseeds.
- **Better irrigation techniques** to reduce the water usage.
- **Reducing the information asymmetry** to improve farmer's knowledge about the possible output in a year using BigData technique.

Case-study: In 2012, the sugarcane-water stories of farmers in Barwani, Madhya Pradesh, and Rajgoli, Maharashtra, were replete with sour details when International Finance Corporation (IFC) of the World Bank Group intervened along with Olam International and Solidaridad. The collaboration, called 'Madhu Shree', recognised water as a key risk-factor, because in 2015, it was rated as the highest global risk by the World Economic Forum, considering its contribution to three of the top five global risks.

Effects of liberalization on the economy, changes in industrial policy and their effects on industrial growth.

Can we integrate "Assemble in India for the world" into "Make in India" to achieve an unprecedented opportunity to chart a China-like, labour-intensive, export trajectory that was witnessed till recent times? Evaluate. (250 words)

Reference: [Money Control](#)

Why this question:

The question is based on the observations pointed out by this year's economic survey.

Key demand of the question:

Explain the advantages and possibility of integrating "Assemble in India for the world" into "Make in India" to achieve an unprecedented opportunity to chart a China-like, labour-intensive, export trajectory that was witnessed till recent times.

Directive:

Evaluate – When you are asked to evaluate, you have to pass a sound judgement about the truth of the given statement in the question or the topic based on evidences. You have to appraise the worth of the statement in question. There is scope for forming a personal opinion here.

Structure of the answer:

Introduction:

On the much debated job creation issue, the Survey highlights that India can look at creating employment by emerging as a major hub for final assembly in a range of products.

Body:

To start with, explain that the Survey says India has unprecedented opportunity to chart a China-like, labour-intensive, export trajectory by integrating “Assemble in India for the world” into Make in India. Discuss the observations made by survey. Give your opinion about the way ahead.

Conclusion:

Conclude on a positive note and suggest at the potential that Indian markets have.

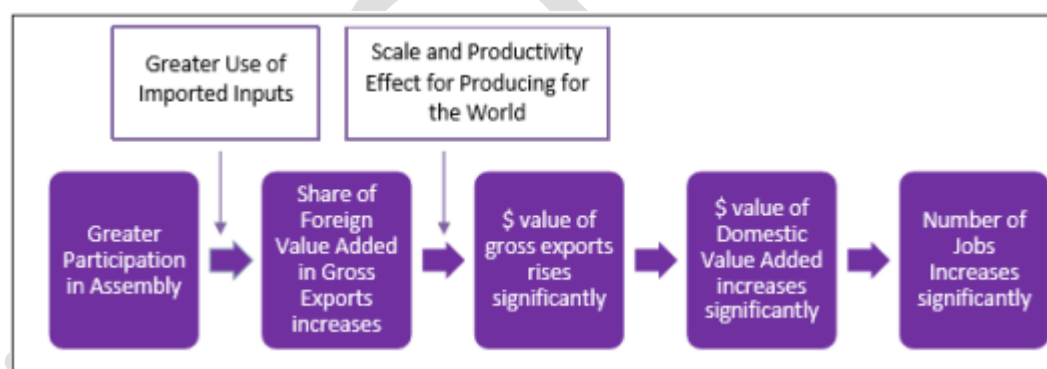

Introduction:

The survey finds that by integrating “Assemble in India for the world” into Make in India, India can create 4 crore well-paid jobs by 2025 and 8 crore by 2030. Our trade policy must be an enabler because growth in exports provides a much-needed pathway for job creation in India. Exports of network products, which is expected to equal \$7 trillion worldwide in 2025, can contribute a quarter of the increase in value-added for the \$5 trillion economy by 2025. Contrary to recent fears, careful analysis that controls for all confounding factors shows that India has gained from trade agreements: a 0.7 per cent increase per year in trade surplus with partner countries for manufactured products and 2.3 per cent per year for total merchandise.

Body:

Challenges for ‘Assemble in India’:

- lack of diversification in our export basket.
- Lack of specialization and state of economies of scale.
- Stringent labour laws.
- Lack of ease of doing business like credit facilities, land, electricity etc.
- Unskilled labour.
- In contrast to India, export growth of capital-intensive products from China has been driven by its high level of participation in GVCs (global value chains) within these industries

Measures needed:

- India needs to specialize more in the areas of its comparative advantage and achieve significant quantity expansion.
- India must replace China as the major exporter of capital-intensive products.
- India has gained a competitive advantage in relatively low and middle income country markets driven by the nature of its specialization. This must be replicated in the richer economies.
- India can benefit significantly from utilizing the potential opportunities from greater trade with high income markets. However, this requires a reorientation of our trade specialization towards labour-intensive product lines.
- The above could be achieved by selective focus on traditional labour-intensive sectors such as textiles, especially man-made fibres, and increased participation in GVCs.

- India can look at creating employment in two groups of industries, given our comparative advantage in labour-intensive activities and the imperative of creating employment for a growing labour force.

Way forward:

- First, there exists a significant unexploited export potential in India's traditional unskilled labour-intensive industries such as textiles, clothing, footwear and toys.
- Second, India has huge potential to emerge as a major hub for final assembly in a range of products, referred to as "network products" (NP).
- The Global Value Chains (GVCs) in these industries are controlled by leading MNEs such as Apple, Samsung, Sony etc. within "producer driven" networks. In general, these products are not produced from start to finish within a given country; instead, countries specialize in particular tasks or stages of the good's production sequence.
- Focus on "Network Products": A group of Industries, where production processes are globally fragmented and controlled by leading Multi-National Enterprises (MNEs) within their "producer driven" global production networks. Examples of network products include computers, electronic and electrical equipment, telecommunication equipment, road vehicles etc. For
- Laser-like focus must be placed on enabling assembling operations at mammoth scale in network products. As an India that harbours misplaced insecurity on the trade front is unlikely to grab this opportunity, our trade policy must be an enabler.
- policy measures should focus on reducing input tariffs, implementation of key factor market reforms, providing an enabling environment for the entry of lead firms into the country and reducing the service link costs.

Do you think Jio-Facebook alliance can reshape the retail landscape in India? Analyse the opportunities and obstructions that may arise from such a deal for India.(250 words)

Reference: [Indian Express](#)

Why this question:

The question is amidst the recent Jio-Facebook alliance and study of its impact.

Key demand of the question:

Explain the effect of Jio-Facebook alliance on the retail landscape in India; discuss the possible advantages and disadvantages of the deal.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Explain the context of the question.

Body:

To start with, discuss the impact of the alliance first. Explain how the deal brings new opportunities for businesses of all sizes, and especially for the millions of small businesses across the country. Then move on to highlight the concerns associated. Discuss solutions that can address such concerns.

Conclusion:

Put forward a futuristic conclusion.

Introduction:

Reliance Industries and Facebook announced that the California-based social media giant will acquire a 9.99 per cent stake in Jio Platforms limited, the holding company of Reliance Jio, for \$5.7

billion (Rs 43,574 crore). The deal which pegs the value of Jio platforms at Rs 4.62 lakh crore will help the Reliance group to reduce its debt burden, something the oil-to-telecom conglomerate has been actively working towards. The two companies expect to benefit from the synergies created by partnerships between the various arms of Reliance — retail and telecom — and Facebook's platforms such as WhatsApp.

Body:

Implications on retail landscape in India:

Benefiting Millions of Small Businesses:

- At its core, Reliance's idea is to create an ecosystem, by enabling customers to access the local Kirana stores using WhatsApp, combining both offline and online retail.
- This deal will support the Reliance group's ambitions for JioMart, an internet venture that aims to grant millions of small sellers across India access to a mass market of customers online.
- This ability to connect millions of local businesses with end consumers, and provide them with a seamless online transaction experience could radically alter the country's retail landscape.

Boosting India's Internet Scenario:

- This strategic partnership with India's one of the largest telecom operators will be key to India's future technological plays, particularly in virtual reality (VR) and Internet of Things (IoT), and 5G network.
- India's internet framework may get a technological boost, and that too reaching citizens in a short time.
- This deal may help in deepening financial inclusion as 400 million users of WhatsApp, may leverage Facebook's Whatsapp pay-UPI platform.

- Also, because of Facebook's Libra cryptocurrency service, this deal could be a step further for experimenting crypto-based payments and blockchain technology on a large scale in India.

Opportunities:

- The deal, it said, will allow both Facebook and Jio to monetise their digital platforms, engage customers online, and provide direct connectivity between users and merchants.
- Usage of digital platforms is likely to grow significantly in the medium term amid severe disruptions caused by lockdowns and social distancing measures.
- A scaling up of this model will also provide opportunities for cross-selling — significantly increasing the upside for firms and increasing the valuation of its retail arms.
- At present, though, the reach of WhatsApp Pay is limited — just over a million Indians are reported to currently have access to the pay feature.
- But this sort of model is popular in other Asian economies such as China, Korea and Japan where apps like WeChat have a wide range of product offerings, which induces consumer stickiness.
- The deal may also open up the entire WhatsApp consumer base — the near ubiquitous chatting app has a consumer base of around 400 million — to Reliance, including those on other telecom platforms such as Airtel and Vodafone.

Challenges:

- For one, given the dominant market position of the players, concerns over the market structure and its implications for consumer welfare are bound to arise.
- Second, the tie-up also raises questions on net neutrality with the possibility of preferential treatment being granted.
- Facebook's Free Basics platform was shut down by the Telecom Regulatory Authority of India (TRAI) due to net neutrality concerns.
- In 2015, it experimented with Free Basics, which provided free access to basic Internet services as a partnership with service providers.
- Also, violation of principles of net neutrality is difficult to prove, owing to technical issues like low bandwidth, the difference in network capacity in different areas.
- Third, given the data privacy issues highlighted in the past by the Cambridge Analytica episode, for instance, there are apprehensions over the enormous amounts of data that will be collected by these entities, especially when India still does not have a personal data protection law.
- Data is also referred to by many experts as the new oil or new currency of the 21st century.
- This is due to the fact that the vast quantities of data generated by users of online services can be processed into valuable information for commercial and strategic gains by technological giants like Amazon, Google etc.

Conclusion:

This mega-deal will have major implications on India's retail and internet landscape. However, in the context, the role of regulatory bodies such as the Competition Commission of India and Telecom Regulatory Authority of India assumes much importance. The nature of such regulation will decide the overall fate of India's market, whether it will turn into digital Sarvodaya or will deepen the digital divide.

Science and Technology- developments and their applications and effects in everyday life; Achievements of Indians in science & technology; indigenization of technology and developing new technology.

What is clean hydrogen? Discuss the potential that clean hydrogen industry holds in ensuring cuts in the global greenhouse gas emissions.(250 words)

Reference: [Down To Earth](#)

Why this question:

The article talks about the potential that the clean hydrogen industry holds for doing away with global greenhouse gas emissions.

Key demand of the question:

Explain what clean hydrogen is; discuss its significance in curbing the global greenhouse emissions.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly define what clean hydrogen is. Hydrogen is a clean fuel that, when consumed in a fuel cell, produces only water. Hydrogen can be produced from a variety of domestic resources, such as natural gas, nuclear power, biomass, and renewable power like solar and wind.

Body:

Highlight the facts pointed out by 'Hydrogen Economy Outlook'. The report suggested that renewable hydrogen could be produced for \$0.8 to 1.6/kg in most parts of the world before 2050. Explain the fact that Hydrogen has the potential to power a clean economy. In the years ahead, it will be possible to produce it at low cost using wind and solar power, to store it underground for months, and then pipe it on demand to power everything from ships to steel mills. Take hints from the article and explain the significance.

Conclusion:

Conclude with significance of the clean hydrogen.

Introduction:

Hydrogen is a clean fuel. It is an energy carrier that can be used for a broad range of applications. Also it could serve as a possible substitute to liquid and fossil fuels. Its physical properties could be stated as following. At standard temperature and pressure, hydrogen is a nontoxic, nonmetallic, odorless, tasteless, colorless, and highly combustible diatomic gas with the molecular formula H₂. Widespread adoption of clean hydrogen can cut global greenhouse gas emissions by up to 34 per cent in fossil fuel-dependent sectors by 2050 — and at a manageable cost — according to a new study by research firm BloombergNEF (BNEF).

Body:

potential of clean hydrogen industry in reducing greenhouse gas emissions:

- Hydrogen as a fuel has long been touted as an almost magical solution to air pollution crisis. The only by-product or emission that results from the usage of hydrogen fuel is water — making the fuel 100 per cent clean.

- Hydrogen is considered an alternative fuel. It is due to its ability to power fuel cells in zero-emission electric vehicles, its potential for domestic production, and the fuel cell's potential for high efficiency.
- In fact, a fuel cell coupled with an electric motor is two to three times more efficient than an internal combustion engine running on gasoline.
- Hydrogen can also serve as fuel for internal combustion engines.
- The energy in 2.2 pounds (1 kilogram) of hydrogen gas contains about the same as the energy in 1 gallon (6.2 pounds, 2.8 kilograms) of gasoline.

Benefits of hydrogen as a fuel:

- **It is readily available.** It is a basic earth element and is very abundant. However, it time consuming to separate hydrogen gas from its companion substances. While that may be the case, the results produce a powerful clean energy source.
- **It doesn't produce harmful emissions.** When it is burned, it doesn't emit harmful substances. Basically, it reacts with oxygen without burning and the energy it releases can be used to generate electricity used to drive an electric motor. Also, it doesn't generate carbon dioxide when burnt, not unlike other power sources.
- **It is environmentally friendly.** It is a non-toxic substance which is rare for a fuel source. Others such as nuclear energy, coal and gasoline are either toxic or found in places that have hazardous environments. Because hydrogen is friendly towards the environment, it can be used in ways that other fuels can't even possibly match.
- **It can be used as fuel in rockets.** It is both powerful and efficient. It is enough to provide power for powerful machines such as spaceships. Also, given that it is environmentally friendly, it is a much safer choice compared to other fuel sources. A fun fact: hydrogen is three times as powerful as gasoline and other fossil fuels. This means that it can accomplish more with less.
- **It is fuel efficient.** Compared to diesel or gas, it is much more fuel efficient as it can produce more energy per pound of fuel. This means that if a car is fueled by hydrogen, it can go farther than a vehicle loaded with the same amount of fuel but using a more traditional source of energy. Hydrogen-powered fuel cells have two or three times the efficiency of traditional combustion technologies. For example, a conventional combustion-based power plant usually generates electricity between 33 to 35 percent efficiency. Hydrogen fuel cells are capable of generating electricity of up to 65 percent efficiency.
- **It is renewable.** It can be produced again and again, unlike other non-renewable sources of energy. This means that with hydrogen, you get a fuel source that is limited. Basically, hydrogen energy can be produced on demand.

Limitations to Hydrogen production:

- Hydrogen is the most abundant element in the universe, but it does not occur in deposits or reserves like fossil fuel. It needs to be actually produced using chemical reactions.
- And here lies hydrogen's biggest roadblock to wider acceptance — hydrogen today is almost entirely produced from fossil fuels.
- Hydrogen is produced by extraction from organic matter, hydrocarbons and, of course, water.
- Majority of the hydrogen that is produced comes from steam-reforming, which combines steam with natural gas at very high temperatures. The most popular gas used for this process is methane.
- Hydrogen, using renewables, is far more expensive to produce. And hydrogen-fueled vehicles are also more expensive than even battery-electric ones.

- It is highly flammable. Since it is a very powerful source of fuel, hydrogen can be very flammable. In fact, it is on the news frequently for its many number of risks. Hydrogen gas burns in air at very wide concentrations – between 4 and 75 percent.
- It is difficult to store. Hydrogen is very hard to move around. When speaking about oil, that element can be sent through pipelines. When discussing coal, that can be easily carried off on the back of trucks. When talking about hydrogen, just moving even small amounts is a very expensive matter.
- The clean hydrogen industry is small and costs are high. There is a big potential for costs to fall, but the use of hydrogen needs to be scaled up and a network of supply infrastructure created.

Conclusion:

China uses hydrogen fuel cell-powered trams while Germany runs hydrogen-trains. Hydrogen is used in bikes, cycles, scooters, trucks, aeroplanes and most other forms of transportation. NASA even launched space shuttles with hydrogen fuel. With a view to accelerate development of hydrogen energy sector in India, a **National Hydrogen Energy Road Map (NHERM)** was prepared and adopted by the National Hydrogen Energy Board in January, 2006 for implementation.

What are 'Cytokine storms'? Discuss its effect on body's immune system.(250 words)

Reference: [Indian Express](#)

Why this question:

The article presents a detailed discussion of what is the cytokine storm and how is it triggered when a virus (or antigen) enters the body for the first time? How does the body's immune system work? Thus the question.

Key demand of the question:

Explain the concept of cytokine storms and discuss its effect on body's immune system.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define what cytokines are – Cytokines are a class of immune regulatory proteins that are secreted by the cells especially of the immune system.

Body:

Explain what a Cytokine Storm Syndrome is – it a form of Systemic Inflammatory Response Syndrome that can be triggered by a variety of factors such as infections and certain drugs. It occurs when large number of white blood cells are activated and release inflammatory cytokines which in turn activate yet more white blood cells. Move on to explain Role of Cytokine storm in the human immune system. Present the case of COVID-19 patient, explain the effect in detail.

Conclusion:

Conclude with the fact that cytokine is seen as a likely major cause of mortality in both 1918-20 Spanish flu that killed more than 50 million people worldwide. And H1N1 (swine flu) and H5N1 (bird flu) outbreaks in recent years.

Introduction:

A cytokine storm is an overproduction of immune cells and their activating compounds (cytokines), which, in a flu infection, is often associated with a surge of activated immune cells into the lungs. The resulting lung inflammation and fluid buildup can lead to respiratory distress and can be

contaminated by a secondary bacterial pneumonia — often enhancing the mortality in patients. Sometimes, a cytokine storm may be severe or life threatening and lead to multiple organ failure. Also called **hypercytokinemia**.

Accumulating evidence suggests that a subset of patients with severe Covid-19 might have a “Cytokine Storm Syndrome” (CSS).

Body:

Role of Cytokines

Effect on body's immune system:

- Cytokines are inflammatory immunological proteins that are there to fight off infections and ward off cancers.
- They are signalling proteins that are released by cells at local high concentrations — a cytokine storm
- The release of inflammatory mediators increases the blood flow to the area, which allows larger numbers of immune system cells to be carried to the injured tissue, thereby aiding the repairing process. Thus, inflammation has an important protective function.
- However, if this inflammatory response is not regulated, very dangerous consequences can follow. This is when a ‘cytokine storm’ can be triggered.
- A severe immune reaction, leading to the secretion of too many cytokines in the bloodstream, can be harmful since an excess of immune cells can attack healthy tissue as well.
- The damage to the surrounding cells can be catastrophic, leading to sepsis and potentially, death.

Conclusion:

Cytokine storms are not exclusive to coronavirus patients. It is an immune reaction that can occur during other infectious and non-infectious diseases as well. CSS is seen as a likely major cause of mortality in both the 1918-20 Spanish Flu that killed more than 50 million people worldwide, and the H1N1 (swine flu) and H5N1 (bird flu) outbreaks in recent years. If the clinical features of CSS are not recognised and adequate treatment is not promptly instituted, multiple organ failure can result. Researchers writing in The Lancet have suggested that all severe COVID-19 patients should be screened for hyper inflammation.

“The coronavirus speeds up the transition to a digital economy while exposing the digital gap between countries and societies”, Examine.(250 words)

Reference: [Indian Express](https://www.indianexpress.com)

Why this question:

The question aims to evaluate the effect of the corona pandemic on the digital economy of the world society.

Key demand of the question:

Explain the impact of the pandemic on the digital economy, the hints towards the digital divide and the need and necessity to bridge it.

Directive:

Examine – When asked to ‘Examine’, we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Telegram: <https://t.me/insightsIAStips>

Youtube: <https://www.youtube.com/channel/UCpocbcCX9GEIwaile4HLjwA>

Facebook: <https://www.facebook.com/insightsonindia>

Briefly explain the current stage of digital economy across the countries.

Body:

Explain that the global crisis brought on by the coronavirus pandemic has pushed us further into a digital world, and changes in behaviour are likely to have lasting effects when the economy starts to pick up. But not everyone is ready to embrace a more digitized existence.

A [new analysis from UNCTAD](#) maps the changing digital landscape since the last major global calamity, the 2008/09 financial crisis. It looks at how a digitally enabled world is working for some, but not all equally.

According to the analysis, the coronavirus crisis has accelerated the uptake of digital solutions, tools, and services, speeding up the global transition towards a digital economy.

Explain that Inequalities in digital readiness hamper the ability of large parts of the world to take advantage of technologies that help us cope with the coronavirus pandemic by staying at home.

Suggest way forward.

Conclusion:

This situation has significant development implications that cannot be ignored. We need to ensure that we do not leave those who are less digitally equipped even further behind in a post-coronavirus world.

Introduction

While the coronavirus pandemic presents business risks in some areas, it also offers opportunities in others, like boost to the **Digital Economy**. The key is to acknowledge the potential threats while exploring the possibilities.

Body

Digital Economy transition in the wake of pandemic

- With businesses closing their doors and governments urging their citizens to stay home, the coronavirus has had a profound global impact.
- Across the globe, the reduced in-store activity is driving increased e-commerce activity. For example, consumers in India are turning to online grocery shopping.
- According to an assessment by DMEXCO survey in USA, the COVID-19 crisis will accelerate the pace of the digital transformation. Nearly the entire digital sector is currently working from home.
- Working from home environment will be accepted more and more by employers and employees in these situations.
- Collaboration tools like Skype video conferencing, BlueJeans video, Cisco Webex are being re-invented. More companies will opt for customized version of these tools in the near future.
- Expansion of the internet will accelerate. Data protection and security will get more focus henceforth.

However digital economy remains elusive to most part of the third world nations and even within India there remains a huge Digital Divide. Even today smart phones, computers and internet are inaccessible to many around the world. Most of the digital infrastructure is centred around urban areas.

Digital Divide and inequality

- Increasing penetration of digital technology by bridging the existing digital divides is associated with greater social progress of a country.
- Social capital: Once an individual is connected, Internet connectivity and ICTs can enhance his or her future social and cultural capital.

- **Economic disparity is created** between those who can afford the technology and those who don't.
- A direct correlation between a company's access to technological advancements and its overall success in bolstering the economy.
- **Education:** The digital divide also impacts children's ability to learn and grow in low-income school districts. Without Internet access, students are unable to cultivate necessary tech skills in order to understand today's dynamic economy.
- **Lack of information:** Almost all India's socio-economic problems had links to the "digital divide", which had come to stay during the era of digital revolution and then again during the era of internet revolution in India.
 - Rural India suffered from information poverty. Information is controlled by a few at the top of the pyramid who restrict its percolation down to those at the bottom.
 - Political empowerment and mobilisation in the age of social media is difficult when there is digital divide.

India's potential

India is an important and lucrative destination for technological companies due to the following reasons:

- **Burgeoning population:** Rising affluence will make India the third-largest consumer market by 2025, making it imperative for companies to adapt their business models for meeting the changing customer needs. Consumption expenditure will increase three times to hit **\$4 trillion by 2025**, according to a report by the Boston Consulting Group.
- **Growing online presence of the population:** IAMAI report says that Urban India with an estimated population of 455 million already has **300 million** using the internet.
- Rural India has only 186 million internet users. The numbers are expected to reach 500 million soon.
- **Digital India and governance:** Indian government's initiative of Digital India to revolutionize the ICT is a welcome step. The programs of connecting every Gram panchayat with internet under **BharatNet** and mobile connection will strengthen the competition for tech industries.
- **Skilled workforce:** With young workforce and continuing policy reform, India has not only emerged as the fastest-growing economy, but its stars also shine bright amid the current global gloom. About 400 million strong workforce between the age group of 21-40 is ready to make India the labour capital of world.

Conclusion

India must quickly identify the gaps and potentials and leverage our strengths to ensure digital connectivity for all. We can improve the stagnant economy and accelerate the pace of growth by enabling digital revolution in every nook and corner of India, especially in the post-pandemic world.

What is hydroxychloroquine? Why is it in demand? Do you think it is the silver bullet to address the ongoing pandemic? Analyse.(250 words)

Reference: [Indian Express](#)

Introduction:

Hydroxychloroquine (HCQ) is a medication used for the prevention and treatment of certain types of malaria, specifically for chloroquine-sensitive malaria. It is also used in treatment of rheumatoid arthritis, lupus, and porphyria cuanea tarda. The government of India banned export of

hydroxychloroquine, with immediate effect to ensure sufficient availability of the medicine in the domestic market on April 4. The US President warned about “retaliation” if India did not heed his request for the drug. Following this India partially lifted a ban on the export.

Body:**Reasons for HCQ in demand:**

- The International Journal of Antimicrobial Agents (IJAA), reported that Azithromycin (antibiotic) added to hydroxychloroquine was significantly more efficient for COVID-19 elimination.
- However, the study was flagged as being too small to draw a definitive conclusion.
- By late March, Trump had begun to call the drug a “game changer”, and has since been pushing it.
- At the end of last month, the Indian Council of Medical Research (ICMR) issued an advisory recommending the use of hydroxychloroquine in asymptomatic healthcare workers treating COVID-19 patients.
- ICMR also allowed doctors to prescribe it for household contacts of confirmed COVID-19 patients.
- However, the government has stressed that the drug can only be used in COVID-19 treatment on prescription, and that it should not instill a sense of “false security”.
- In March, Following the ICMR’s advisory on the drug, various patients and healthcare professionals are learnt to have stocked up on hydroxychloroquine.
- The drug was then moved to a Schedule H1 status, which means patients who need the drug would have to get a fresh prescription every time they needed to purchase it.

HCQ- a silver bullet to address the ongoing pandemic?

- The drug shows antiviral activity in vitro against coronaviruses, and specifically, SARS-CoV-2.
- Further, the study suggests that prophylaxis (treatment given to prevent disease) with hydroxychloroquine at approved doses could prevent SARS-CoV-2 infection and may help to improve viral shedding.
- Clinical trials are under way in China to know whether the drug can be used for treatment.
- At the same time, research in other parts of the world has sparked interest in a more expansive use of the anti-malarial medicine.
- A study by Chinese researchers, for instance, showed that the drug speeded up the recovery of COVID-19 patients who had suffered pneumonia.
- Experiments on the drug have also yielded promising results in France. Some experts have called for more tests before hydroxychloroquine is held up as a cure for COVID-19.
- But some of the early naysayers of the drug, including the US Food and Drug Administration, have now come around to recommending its use in emergency situations.
- Hydroxychloroquine as a COVID-19 palliative, by all accounts, seems to be a work in progress.
- However, in a world embroiled in a grim struggle against COVID-19, reports of the early success of the drug have generated hope especially in the US, the country hit hardest by the pandemic.
- In such a situation, it is critical that India’s decision on the US request be an informed and considered one.

Conclusion:

India has one of the lowest manufacturing costs in the world – lower than that of the U.S. and almost half of the cost in Europe. As the country plans to intensify the battle against the novel

coronavirus in hotspots, the GoM's decision must be based on consultations with a wide range of experts — scientists, public health and foreign policy experts and representatives of the pharma industry. India should look up to and invest in biotechnology. India's biotechnology industry, comprising biopharmaceuticals, bio-services, bio agriculture, bio-industry and bioinformatics is expected to grow at an average rate of around 30% a year and reach \$100 billion by 2025. To ensure health security of Indian people, revival of R&D and public sector API manufacturers through bodies like CSIR is necessary.

What do you understand by Genome Sequencing? Discuss the various efforts by India in this regard and how will it lead to precision medicine and develop its commercial gene testing services? (250 words)

Reference : [Indian Express](#)

Why this question:

The ongoing analysis of the gene sequences of the novel coronavirus has so far not revealed anything to suggest that the virus present in India is in any way different from that circulating in other parts of the world. There is also no evidence, as of now, of any one particular strain of the virus being more deadly than the other, scientists have said.

Key demand of the question:

The question is straightforward; one must explain the concept of what is genome sequencing and in what way it will help in precision medicine and commercial gene testing services.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In brief explain the context of the question.

Body:

Explain first what is whole genome sequencing? Discuss the various efforts taken by the Government of India in this regard. Explain the challenges involved.

Conclusion:

Conclude with significance of such a project.

Introduction:

A genome is the DNA, or sequence of genes, in a cell. Most of the DNA is in the nucleus and intricately coiled into a structure called the chromosome. The rest is in the mitochondria, the cell's powerhouse. Every human cell contains a pair of chromosomes, each of which has three billion base pairs or one of four molecules that pair in precise ways. The order of base pairs and varying lengths of these sequences constitute the "genes", which are responsible for making amino acids, proteins and, thereby, everything that is necessary for the body to function. It is when these genes are altered or mutated that proteins sometimes do not function as intended, leading to disease.

Body:

Genome sequencing is the process that involves deciphering the exact order of base pairs in an individual. This "deciphering" or reading of the genome is what sequencing is all about. Costs of sequencing differ based on the methods employed to do the reading or the accuracy stressed upon in decoding the genome.

**Importance of Genome Sequencing:**

- A genetic test, which is commercially available at several outlets in the country, usually involves analysing only a portion of the genome that's known to contain aberrant genes linked to disease.
- It is important to ensure that India, with its unparalleled human diversity, is adequately represented in terms of genomic data and develops indigenous capacity to generate, maintain, analyse, utilize and communicate large-scale genome data, in a scalable manner.
- Ever since the human genome was first sequenced in 2003, it opened a fresh perspective on the link between disease and the unique genetic make-up of each individual.
- Nearly 10,000 diseases including cystic fibrosis, thalassemia are known to be the result of a single gene malfunctioning.
- While genes may render some insensitive to certain drugs, genome sequencing has shown that cancer too can be understood from the viewpoint of genetics, rather than being seen as a disease of certain organs.
- The human genome has about 3.2 billion base pairs and just 10 years ago cost about \$10,000. Now prices have fallen to a tenth.

India's efforts towards Genome sequencing:

- **Two institutes of Centre for Scientific and Industrial Research (CSIR) Centre for Cellular and Molecular Biology (CCMB), Hyderabad and Institute of Genomics and Integrative Biology (IGIB), New Delhi have started working together on the whole genome sequencing of novel coronavirus**
- **IndiGen Genome project:**
 - The IndiGen initiative was undertaken by CSIR in April 2019, which was implemented by the CSIR-Institute of Genomics and Integrative Biology (IGIB), Delhi and CSIR-Centre for Cellular and Molecular Biology (CCMB), Hyderabad.
 - The objective is to enable genetic epidemiology and develop public health technologies applications using population genome data.
 - This has enabled benchmarking the scalability of genome sequencing and computational analysis at population scale in a defined timeline.
 - The ability to decode the genetic blueprint of humans through whole genome sequencing will be a major driver for biomedical science.
 - IndiGen programme aims to undertake whole genome sequencing of thousands of individuals representing diverse ethnic groups from India.
- **Genome India:**
 - The Government of India has cleared a gene-mapping project called "Genome India" recently.
 - To build a grid of the Indian "reference genome", to understand fully the type and nature of diseases and traits that comprise the diverse Indian population.
 - This is spearheaded by the Centre for Brain Research at Bengaluru-based Indian Institute of Science as the nodal point of about 20 institutions.

- Each of these institutions will do their bit in collecting samples, doing the computations, and then the research.
- It hopes to form a grid after collecting 10,000 samples in the first phase from across India, to arrive at a representative Indian genome.
- Most genomes have been sourced from urban middle-class persons and are not really seen as representative.
- Over 95% of the genome samples available, which are the basis of new, cutting-edge research in medicine and pharmacology, use the Caucasian genome as the base.
- So, this Indian genome project is seen as a necessity.

Conclusion:

CSIR is planning to train more clinicians for gene data interpretation and rope in more labs for sequencing. Apart from IGIB and CCMB, National Institute of Biomedical Genomics in Kolkata and Indian Institute of Science in Bengaluru will also be part of the IndiGen project. More physicians are being trained to study medical genetics for speedier analysis.

Awareness in the fields of IT, Space, Computers, robotics, nano-technology, bio-technology and issues relating to intellectual property rights.

What do you understand by Convalescent plasma therapy? What are its key features? Discuss the pros and cons associated with it. (250 words)

Reference: [Indian Express](#)

Introduction:

The convalescent plasma therapy aims at using antibodies from the blood of a recovered Covid-19 patient to treat those critically affected by the virus. The therapy can also be used to immunize those at a high risk of contracting the virus — such as health workers, families of patients and other high-risk contacts. Several countries including China and the US have already started the clinical trials of the Convalescent Plasma Therapy due to the absence of a coronavirus-specific treatment to cure the infected patients. Recently, Kerala has got the Indian Council of Medical Research (ICMR) approval for the clinical protocol exploring the feasibility of convalescent plasma transfusion which may be administered to severe Covid-19 patients.

Body:

Key features:

- Convalescent Plasma Therapy, also known as passive antibody therapy, provides a person with already developed antibodies to fight a virus.
- Under the Plasma Therapy, the COVID-19 patients will be infused with an antibody-rich blood plasma of the people who have recovered from the novel Coronavirus.
- The Convalescent Plasma Therapy is based on the antibodies and proteins developed by the immune system that protects the body from any potential harm.
- When any virus attacks the body, the immune system produces antibodies to attack the virus. These antibodies are produced by immune cells 'B lymphocytes', found in blood plasma.
- The person who recovers from a virus has developed antibodies that stay in blood to fight the same virus, if it returns. And if these antibodies are infused into other person infected with the same virus, they recognize the virus and attack it. However, these antibodies stay for short period in other person's blood.
- Some antibodies neutralize the virus and some work by mobilizing the immune cells to combat a disease.

Pros:

- Advantages of the therapy are that it is the viable option in our healthcare system.
- It is quickly doable and there are no major side effects.
- The most important thing is that convalescent sera is easily transportable to any part of the country/worldwide by maintaining adequate cold-chain process similar to vaccine
- Adding therapeutic plasma exchange in tertiary care centres using convalescent sera of COVID-19 will be the more effective way of therapy in COVID-19 patients.

Cons:

- Therapy is expensive
- Limited number of plasma donors

- Only the critically-ill patients who need support care will get Plasma Therapy treatment. The therapy will not be used for patients showing mild or no symptoms.
- Despite the potential utility of passive antibody treatments, there have been few concerted efforts to use them as initial therapies against emerging and pandemic infectious threats.
- The absence of large trials certainly contributes to the hesitancy to employ this treatment.
- Also, the most effective formulations (convalescent plasma or hyperimmune globulin, H-Ig) are unknown.
- Convalescent plasma has the advantage that while its antibodies limit viral replication, other plasma components can also exert beneficial effects such as replenishing coagulation factors when given to patients with hemorrhagic fevers such as Ebola.
- On the other hand, individual convalescent plasma units demonstrate donor-dependent variability in antibody specificities and titers. H-Ig preparations, in contrast, contain standardized antibody doses, although fractionation removes IgM, which may be necessary against some viruses.
- Nonetheless, the construction of a strategic stockpile of frozen, pathogen-reduced plasma, collected from Ebola-convalescent patients with well-characterized viral neutralization activities, is one example of how to proceed despite existing unknowns.

Risks involved

Besides speaking about the success of the convalescent plasma therapy, the study by John Hopkins immunologists stated some of the risks associated with it:

- Transfer of blood substances: As the blood transfusion takes place, there are risks that an inadvertent infection might get transferred to the patient.
- Enhancement of infection: The therapy might fail for some patients and can result in an enhanced form of the infection.
- Effect on immune system: The antibody administration may end up suppressing the body's natural immune response, leaving a Covid-19 patient vulnerable to subsequent re-infection.

Conclusion:

The Convalescent plasma therapy was first used during the 1918 Spanish Influenza outbreak. The approach was used recently during the outbreak of SARS, MERS and Ebola viruses. The convalescent plasma therapy is akin to passive immunization as, according to researchers, it is a preventive measure and not a treatment for the Covid-19 disease.

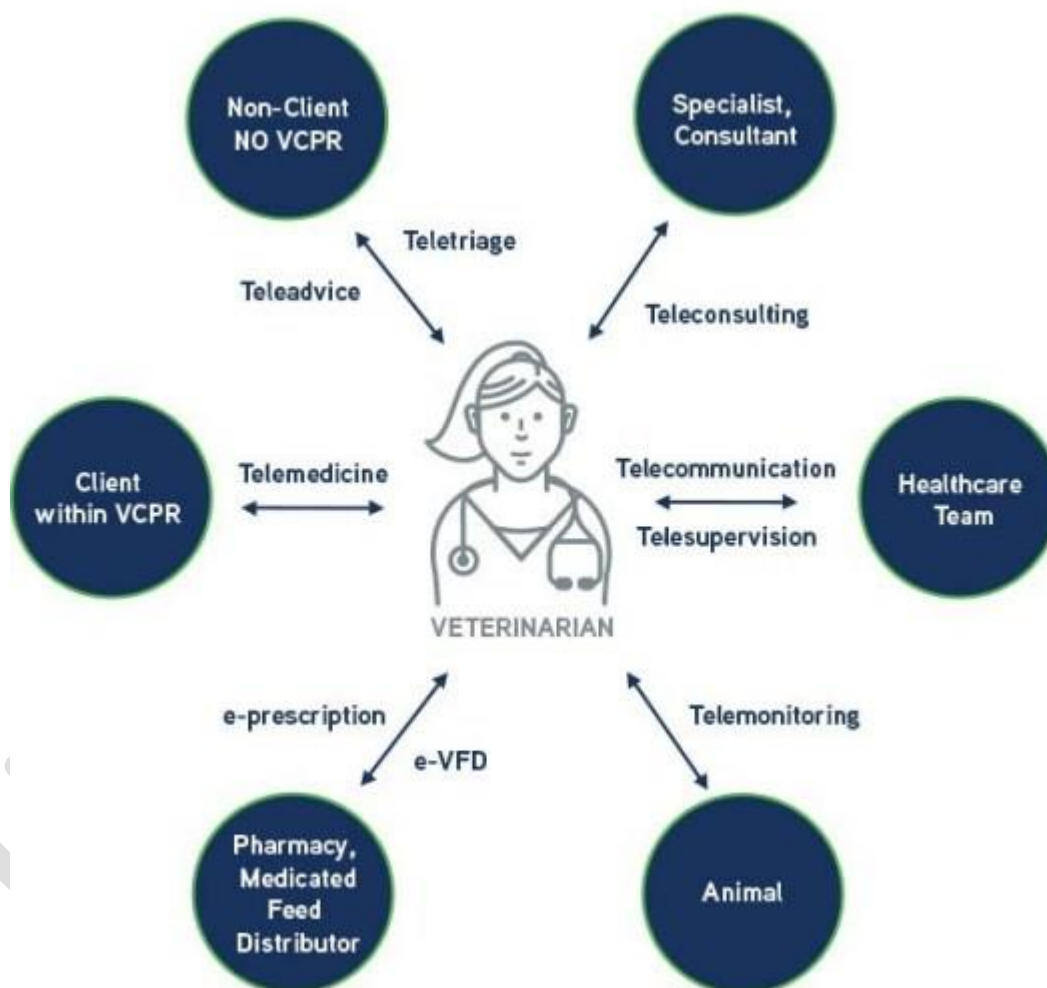

Elaborate on the recent developments made in Indian Telemedicine. Examine the possible inadequacies of the medium and suggest measures to address the same. (250 words)

Reference: [The Hindu](#)

Introduction:

The World Health Organization (WHO) refers to telemedicine as “healing from a distance”. It is the remote delivery of healthcare services. It is the use of telecommunications technology and information technologies to provide remote clinical services to patients. Physicians use telemedicine for the transmission of digital imaging, video consultations, and remote medical diagnosis

Body:

Recent developments made in Indian Telemedicine:

- Indian Space Research Organization made a modest beginning in telemedicine in India with a Telemedicine Pilot Project in 2001, linking Chennai's Apollo Hospital with the Apollo Rural Hospital at Aragonda village of Andhra Pradesh.

- The efficacy of telemedicine has already been shown through the network established by the Indian Space Research Organization (ISRO), which has connected 22 super-specialty hospitals with 78 rural and remote hospitals across the country through its geo-stationary satellites.
- ISRO has also provided connectivity for mobile telemedicine units in villages, particularly in the areas of community health and ophthalmology.
- The setting up of the National Telemedicine Taskforce by the Health Ministry of India, in 2005, paved way for the success of various projects like the ICMR-AROGYASREE, NeHA and VRCs.
- Telemedicine division of MoHFW, GOI has set up a National Telemedicine Portal for implementing a green field project on e-health establishing a National Medical College Network (NMCN) for interlinking the Medical Colleges across the country with the purpose of e-Education and a National Rural Telemedicine Network for e-Healthcare delivery.
- AROGYASREE is another internet-based mobile telemedicine conglomerate that integrates multiple hospitals, mobile medical specialists and rural mobile units/clinics. The project is an initiative of Indian Council of Medical Research (ICMR).

Benefits of Telemedicine in India:

- India only has one government doctor for every 1,139 people, whereas the World Health Organization (WHO) recommends a ratio of 1: 1,000.
- The shortage of doctors is limiting face-to-face consultations among patients. Secondly, India also has a shortage of hospital beds, which makes hospitalization tricky.
- Telemedicine will reduce the time of consultations and improve the quality of healthcare services in urban as well as rural areas, removing many of infrastructural challenges.
- Telemedicine is a sector that bridges the healthcare gap between rural India and urban India.
- In rural India, where the access to medical facilities, specialists' opinion and advance healthcare amenities are limited, telemedicine acts as a healthcare provider bringing access to the specialist doctors to these areas.

Challenges to telemedicine:

- **Unclear Policies**
 - Because technology is growing at such a fast pace, it's been difficult for policymakers to keep up with the industry.
 - There is great uncertainty regarding matters like reimbursement policies, privacy protection, and healthcare laws. In addition, telemedicine laws are different in every state.
- **Fewer Face-to-Face Consultations:**
 - Several physicians and patients are finding it difficult to adapt to telemedicine, especially older adults.
 - Physicians are very concerned about patient mismanagement.
 - While advances in medicine have made it more efficient to use technology, there are times when system outages occur.
 - There is also the potential for error as technology cannot always capture what the human touch can.
- **Technology Is Expensive**

- Healthcare systems that adopt telemedicine solutions can attest that it requires a lot of time and money.
- Implementing a new system requires training and sometimes staff members find it difficult to welcome this change.
- Practice managers, nurses, physicians, and more have to learn how to utilize the system so that practices can see the benefits.
- Although telemedicine is expensive in the beginning, healthcare systems should see a positive return on investment over time due to more patients and less staff.

Conclusion:

Technology plays a crucial role in fight against COVID-19. The pandemic has contributed to the understanding of various ways in which available technologies can be put to better use and presented people with multiple opportunities to harness these devices, techniques and methods to get on with life in the time of lockdown. Among the primary uses is telemedicine that can help reach patients where access to medical care is difficult. While unleashing the full potential of telemedicine to help people, experts and government agencies must be mindful of the possible inadequacies of the medium, and securing sensitive medical information; such cognizance should guide the use of the technology.

An efficient and equitable intellectual property system can help India to realize intellectual property's potential as a catalyst for economic development and social & cultural well-being. Discuss. (250 words)

Reference: [Business Standard](#)

Why this question:

The question is premised on the importance and relevance of efficient and equitable intellectual property system for our country and in what way it can act as a catalyst for economic development and social & cultural well-being.

Key demand of the question:

Explain the importance of intellectual property system to the country and draw its relations to economic development and social & cultural well-being of the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Explain IPR – Intellectual property rights (IPR) are the rights given to persons over the creations of their minds: inventions, literary and artistic works, and symbols, names and images used in commerce. They usually give the creator an exclusive right over the use of his/her creation for a certain period of time.

Body:

To start with, explain why there is need of IPRs. Present the case of India and the rule and regulations available with it in respect of IPR regimen. Discuss the national IPR policy. Highlight the challenges and concerns associated.

Conclusion:

Draw a balanced conclusion justifying how an effective IPR system can act as a catalyst for economic development and social & cultural well-being.

Introduction

Intellectual Property Rights (IPRs) are legal rights, which result from intellectual invention, innovation and discovery in the industrial, scientific, literary and artistic fields. These rights entitle an individual or group to the moral and economic rights of creators in their creation. For ex: In India, patents are granted for a period of 20 years from the date of filing of the patent application.

It is also to be noted that the patents are valid only within the territory where they have been granted. Once a patent expires, protection ends and the invention enters the public domain. In India, Patent Acts, 1970 regulate the IPRs.

Body

Need for IPR's in India

- They allow creators, or owners, of patents, trademarks or copyrighted works to benefit from their own work or investment in a creation.
- Patents provide incentives which encourage innovation, which in turn enhances the quality of human life.
- In return for patent protection, all patent owners are obliged to publicly disclose information on their inventions in order to enrich the total body of technical knowledge in the world. This ever increasing body of public knowledge promotes further creativity and innovation.
- The legal protection of new creations encourages the commitment of additional resources for further innovation.
- It promotes innovation and creativity and ensures ease of doing business. It facilitates the transfer of technology in the form of foreign direct investment, joint ventures and licensing.
- The promotion and protection of intellectual property spurs economic growth, creates new jobs and industries, and enhances the quality and enjoyment of life.
- It ensures credibility and quality of a product thereby enhancing consumers confidence through reliable, international trademark protection and enforcement mechanisms to discourage counterfeiting and piracy.
- These rights are outlined in Article 27 of the Universal Declaration of Human Rights, which provides for the right to benefit from the protection of moral and material interests resulting from authorship of scientific, literary or artistic productions.

India's National IPR Policy

The National Intellectual Property Rights (IPR) Policy 2016 was adopted in May 2016 as a vision document to guide future development of IPRs in the country. It's motto is **"Creative India; Innovative India"**.

- **Thrust on IPR Awareness, Outreach and Promotion** - To create public awareness about the economic, social and cultural benefits of IPRs among all sections of society.
- **Generation of IPRs** - To stimulate the generation of IPRs.
- **Legal Framework** - To have strong and effective IPR laws, which balance the interests of rights owners with larger public interest.

- **Administration and Management** - To modernize and strengthen service-oriented IPR administration.
 - It sets in place an institutional mechanism for implementation, monitoring and review. It aims to incorporate and adapt global best practices to the Indian scenario.
 - **Department for Promotion of Industry and Internal Trade (DPIIT)**, Ministry of Commerce, Government of India, has been appointed as the nodal department to coordinate, guide and oversee the implementation and future development of IPRs in India.
 - The '**Cell for IPR Promotion & Management (CIPAM)**', setup under the aegis of DPIIT, is to be the single point of reference for implementation of the objectives of the National IPR Policy.
- **Commercialization of IPRs** - Get value for IPRs through commercialization.
- **Enforcement and Adjudication** - To strengthen the enforcement and adjudicatory mechanisms for combating IPR infringements.
- **Inclusive Development**- To strengthen and expand human resources, institutions and capacities for teaching, training, research and skill building in IPRs.

Challenges associated with IPR's in India

- Policy recommends scientist and professors to convert all their discoveries into IP which in turn has the potential to curb the free flow of knowledge.
- Policy is aimed commercialization and monetizing on IPR's. Rather focus must be to create good and quality innovation that is beneficial for all.
- Foreign investors and MNCs allege that Indian law does not protect against unfair commercial use of test data or other data submitted to the government during the application for market approval of pharmaceutical or agro-chemical products. For this they demand a Data Exclusivity law.
- IPR policy is driven by the agenda of IP maximalism, where IP owners' rights will be maximized at the cost of public interest. This (policy) will influence courts and judges who might consider rights of patentees above that on common man in certain cases.
- Connection between patenting and application of patented knowledge is yet to be established. Hence, patenting and not applying the new invention could deter progress.
- Policy recommends criminalization of unauthorized copying of movies – which is just a civil wrong.
- **Compulsory Licensing**: It is problematic for foreign investors who bring technology as they are concerned about the misuse of CL to replicate their products. It has been impacting India-EU FTA negotiations.
- India continues to remain on the United States Trade Representative's (USTR's) 'Priority Watch List' for alleged violations of intellectual property rights (IPR).

- Not understanding the modes of creativity and sharing in “shadow economy”, the policy leans towards superimposition of formal IP framework.
- While IP could accelerate innovation in certain technologies it in turn impedes in others. Policy recommends scientist and professors to convert all their discoveries

Need of the hour

- India will be unable to take full advantage of the transformative benefits of a strong IP system unless and until it addresses gaps in its IP laws and regulations.
- Fostering an environment where innovation flourishes and a knowledge economy is built, is the key idea. Hence, the policy should have a balance.
- Success of India’s flagship programmes - Make in India and Start up India - depends on the boost of innovation ecosystem with better IPR safeguardings.
- It should encourage patenting and at the same time ensure that patentability of a product/process does not deter further innovation and progress.

Conclusion

Support for innovation has to be accompanied with instruments that guard local companies against the misuse of market power, coercive bargaining and aggressive acquisition strategies. India needs to spread awareness on IPR in public and for its traditional industries to enable fair monetization of IP Rights. An efficient and equitable intellectual property system can help all countries to realize intellectual property’s potential as a catalyst for economic development and social & cultural well-being.

Conservation, environmental pollution and degradation, environmental impact assessment.

While discussing the seaweed distribution and resource potential in India bring out the challenges of rising seaweed tides.(250 words)

Reference: [Geography and You](#), [Research Gate](#)

Why this question:

The question is straightforward and is based on the theme of Seaweed; its utility as a resource and possible concerns associated with it.

Key demand of the question:

Explain the seaweed distribution and resource potential in India; also bring out the challenges of rising seaweed tides.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

First define what Seaweed is – Seaweed or sea vegetables are forms of algae that grow in the sea. They’re a food source for ocean life and range in color from red to green to brown to black. Seaweed grows along rocky shorelines around the world, but it’s most commonly eaten in Asian countries such as Japan, Korea and China

Body:

Telegram: <https://t.me/insightsIAStips>

Youtube: <https://www.youtube.com/channel/UCpocbcX9GEIwaile4HLjwA>

Facebook: <https://www.facebook.com/insightsonindia>

To start with, discuss the distribution and resource potential of it in India – According to a report from the Central Marine Fisheries Research Institute (CMFRI), only 30 million tonnes of seaweeds, valuing €8 billion, are being harvested every year. In India, seaweeds grow abundantly along the Tamil Nadu and Gujarat coasts and around Lakshadweep and the Andaman and Nicobar islands. Discuss the importance of seaweed cultivation to India. Then move onto explain the challenges – highlight the issue of coastal eutrophication, disruption to coastal tourism, negative impact on the health of coasts etc.

Conclusion:

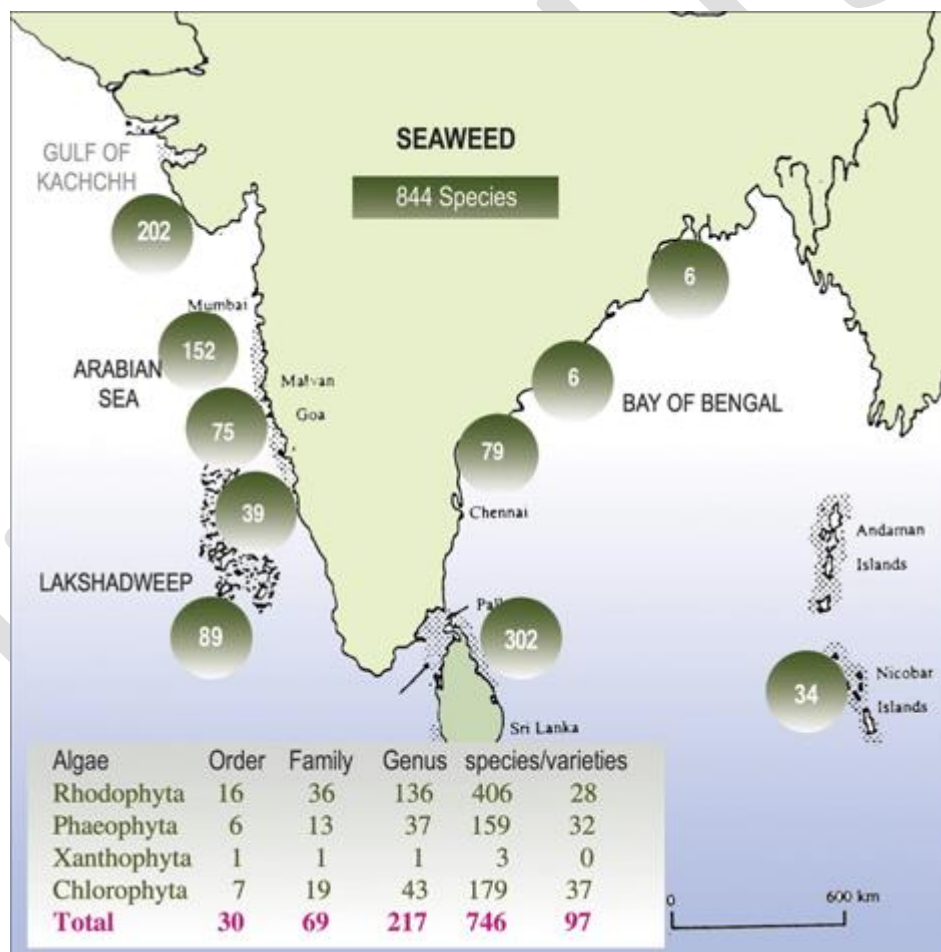

Conclude by suggesting solutions to address the issues associated.

Introduction

Seaweeds are a group of primitive non-flowering marine plants with no distinguishable root, stem and leaves. They are valuable renewable marine living resource and distributed in the intertidal, shallow and deep waters of the sea up to 150m depth. They also occur in estuaries and backwaters. Seaweeds grow on rocks, dead coral stones, pebbles, solid substrates and other plants as epiphytes. Based on the type of pigments, morphological and anatomical characters, seaweeds are broadly classified in to green, brown, red and blue-green algae.

Body

Distribution in India

- In India, several species of green, brown, red and blue-green algae with luxuriant growth occur along the southeast coast of **Tamil Nadu from Rameswaram to Kanyakumari** covering 21 islands in Gulf of Mannar.
- In Gujarat coast, seaweeds occur abundantly at **Okha, Dwarka, Porbandar, Veraval, Diu and Gopnath**.
- Rich seaweeds are present in **Lakshadweep, Andaman -Nicobar Islands** and also in and around Mumbai, Ratnagiri, Goa, Karwar, Varkala, Vizhinjam, Visakhapatnam and coastal lakes such as Pulicat and Chilka.
- In Indian waters so far 271 genera and 844 species of marine algae have been reported.
- Apart from the commonly available 200 species of seaweeds, about 680 species of marine algae belonging to **Rhodophyta, Phaeophyta, Chlorophyta** commonly known as red, brown and green seaweeds have also been identified in both inter-tidal and deep water regions. Among these seaweeds **green algae are rare**. Brown algae are widely distributed. Red algae are small and delicate, with a feathery appearance.

Advantages for India

- **Export Potential:** According to a report from the Central Marine Fisheries Research Institute (CMFRI), only 30 million tonnes of seaweeds, valuing €8 billion, are being harvested every year.
 - India can cultivate more and harvest more with its vast 7500km coastline.
- **Economic/Commercial usage:** Seaweeds new renewable source of food, energy, chemicals and medicines. Provides valuable source of raw material for industries like health food, medicines, pharmaceuticals, textiles, fertilizers, animal feed etc.
 - Seaweeds used for production of **Agar, Alginates & Carrageenan**.
 - Chemicals from brown seaweeds such as **alginic acid, mannitol, laminarin, fucoidin and iodine** have been extracted successfully on a commercial basis.
 - As the alginates can absorb many times their own weight of water, have a wide range of viscosity, can readily form gels and are non-toxic, they have countless uses in the manufacture of **pharmaceuticals, cosmetic creams, paper and cardboard**, and processed foods.
- **Social benefits:** Provide occupation for the coastal people.
 - Provide continues supply of raw material for seaweed based industry.
 - Provide seaweeds of uniform quality for use in industry.
 - Conserve natural populations of concerned seaweeds.
 - Seaweed farming is an ecofriendly activity.
 - Major tool to treat coastal pollution in the sea and reduce CO2 in global warming
- **Challenges in cultivation**
 - The major problems in the seaweed industry include over exploitation leading to a scarcity of raw material, poor quality raw material and also water scarcity.
 - There are labor shortages during the paddy harvesting and transplanting season.

- The lack of technology to improve processed product quality, and a lack of information on new and alternative sources of raw materials.
- Despite the great number of sheltered bays and lagoons suitable for mariculture, not many large-scale (eg: **Pepsico**) attempts to grow seaweed have been made in India so far.
- The culture period of *Porphyra Indica* is only 4 months during winter season, as it cannot grow in rest of the year due to high temperatures. Moreover, the yield is not economical.
 - The same is true for *Enteromorpha intestinalis* as these are the 2 algae which are directly edible in India.
- Efforts are needed to increase production through improving harvesting techniques, removal of competing species, creation of artificial habitats and seeding of cleared areas.
- **Eutrophication** is one of the harmful effects of seaweed cultivation if done unscientifically. This will decrease the dissolved oxygen and lead to mass kill of marine species near the shore.

Conclusion

There is a huge potential in India for seaweed cultivation, which in turn will provide alternate livelihood and income to the local fishermen community. Food processing industries must divulge into this sector to leverage our ample resources and improve exports in seaweed products.

Does India need to have a long-term Water management plan gaining higher importance within the Master Plan of cities? Examine.(250 words)

Reference: [Financial Express](#)

Introduction:

Indian cities have witnessed unprecedented growth over the past few decades that, in turn, has had a drastic impact on water availability. Depleting water resources, changing climate and unsustainable water cycle management are exacerbating the water situation. Many Indian cities have witnessed water exigencies in the form of severe drought and flood. Around 600 million Indians face high to extreme water stress. By 2030, India's demand for water might be double the available supply.

Body:

Need for India to have long-term water management plan:

- Indian cities need to diversify their water resources portfolio.
- Indian cities often fail to anticipate water-related issues and are left to react to these.
- With ageing assets, water theft and non-revenue water, our cities cannot continue to dole out water subsidies, which eventually lead to paucity of funds that could have helped upgrade the water infrastructure.

Measures needed to be taken:

- **A long-term Water Master Plan** should gain higher importance within the Master Plan of cities.

- **Rain-water harvesting:** Few Indian cities have bye-laws that mandate rainwater harvesting. This will need strong legislation and engineering interventions.
- **Recycled water:** Recycled water presents itself as an important component of the water portfolio. It is a climate-change resilient water resource, which can be reliably produced using advanced treatment technologies.
- **Desalination plants:** India too has some desalination plants across few coastal cities, and can capitalise Singapore's strong experience in seawater desalination in bringing down per unit cost of water and developing seawater as a sustainable water source.
- **Integration of digital technology into water management:** The availability of smart metres, water-efficient devices and infrastructure monitoring devices to plug any leakages will be useful to sustain operations and maintenance.
- **Awareness and Education:** Encourage people to reduce their water use by 10 litres a day, observe water conservation week, public visits and engagement, and water visitor centres for people to understand and appreciate the value of water.

Case study of Singapore:

- Singapore's water story offers many valuable lessons that can be learned, contextualised and implemented in Indian cities.
- At the time of its independence, Singapore faced lack of perennial surface water sources, flooding and polluted water ways, limited groundwater availability with a risk of seawater intrusion and dependence on a neighbouring country for drinking water.
- It was able to turn around this vulnerability.
- Today, Singapore's diverse water portfolio—four national taps comprising of surface water, recycled water, harnessed rainwater and desalinated water, ensure that the country's water needs are met sustainably.
- In Singapore, recycled water is called NEWater, wherein used water is treated using advanced treatment technologies (combination of micro and ultra-filtration followed by reverse osmosis and UV disinfection) to ensure that the recycled water complies with the highest water quality standards, and is fit for human consumption.
- Singapore utilises desalinated sea water as its third source of water.
- Integrated and long-term water resources' planning has been Singapore's strength. Supported by strong governance, Singapore's National Water Agency (NWA) judiciously manages the price for its water services, and proactively invests in planning for the future next drop of water. This is supported by strong public outreach and stakeholder engagement programmes, to bolster the value of water

Conclusion:

Indian cities can learn a lot from Singapore, but there is no point blaming them without giving them a fair chance to fight. If we have any hesitation taking this decision, we can always go back to the wise words of the founding father of Singapore, the late Lee Kuan Yew, 'Water dominated every other policy. Every other policy had to bend at the knees for water survival'.

Disaster and disaster management.

Post COVID-19 crisis, the world would witness changes in the geopolitical and geo-economic order. In this context, discuss how the changes can occur across the global institutions and regions.(250 words)

Reference: [The Hindu](#)

Why this question:

The question is amidst the possible geopolitical and geo-economic order that the world would witness owing to the COVID-19 scenario.

Key demand of the question:

Explain the effect of the COVID-19 pandemic on the entire world with special focus on the effect it brings to global institutions and regions..

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly elaborate on the 'new normal' brought by the COVID -19 pandemic.

Body:

To start with, Discuss in brief, what are the new geo political and Geo economic order shifts the pandemic brought. Explain the effect of it on the institutional changes with focus on WHO, UNSC etc. Bring out in detail how the changes are varied across the regions-West, Europe and Asia etc.

Conclusion:

Conclude with a forward looking approach.

Introduction:

COVID-19 pandemic is set to drastically alter geopolitics and human society. The pandemic is unprecedented and has led to radical uncertainty. COVID-19 would change the world and reshape the human society. There is already concern that a diminution in human values could occur, and with this, the concept of an international community might well cease to exist.

Body:

Possible geo-economical change:

- China, which is already one of the most prominent nations of the world and an important player in international institutions, could grow even stronger.
- China is considered indispensable as the world's supplier of manufactured goods.
- China now seeks to benefit from its early recovery from the pandemic to take advantage of the problems of the rest of the world, by using its manufacturing capability to its geo-economic advantage.
- The current pandemic could hollow out the financial viability of many companies, institutions and banks across the world. There are reports of China's intentions to acquire financial assets and stakes in banks and companies across the world, taking advantage of the scaled-down value of their assets.
- China is poised to dominate the global economy.

**Possible geo-political changes:**

- By offering medical aid and other essential supplies to several Asian and African countries during the current pandemic threat, China would gain a geopolitical advantage by its action.
- China with its Belt and Road Initiative, which seeks to combine regional connectivity alongside gaining a virtual economic and substantial stranglehold across Asia, is ostensibly preparing the way for a China-centric multilateral globalisation framework.

Changes occurring in global institutions:

- Existing international institutions such as the United Nations, the United Nations Security Council and the World Health Organization (WHO) are being blamed of having failed to measure up to the challenge posed by the pandemic.
- The UN Security Council has not been able to take any concrete action in dealing with the situation.
- WHO has been blamed of being China-centric. WHO's underestimation and inaction during the initial phase could have amplified the pandemic to such large scales.
- The UN and other global organizations have not been able to ensure a common vision or approach among the many nations. They have failed to ensure cooperation and collaboration among its members.
- That prestigious global institutions are under attack, even in such critical times, speaks about the mood prevailing across the world.

Changes occurring at the regional level:**A faltering West:**

- COVID-19 would effectively change the existing global order that has existed since the late 1940s. The geopolitical fallout of this pandemic could be the decreased dominance of the west.
- The U.S. has been weakened economically and politically due to COVID-19. The U.S.'s capacity to play a critical role in world affairs seems to have diminished. The United States will be compelled to cede ground to the rising Chinese power.
- The Brexit came as a body blow to the EU. Europe too has been badly affected by the pandemic. Germany which has played a major role in promoting EU is turning inwards.
- Both France and a post-Brexit United Kingdom will also be focusing more on domestic issues.
- Europe, in the short and medium term, will prove incapable of defining and defending its common interests, leaving it with very little influence in world affairs.

West Asia:

- In West Asia, both Saudi Arabia and Iran are set to face difficult times.
- The oil price meltdown will aggravate an already difficult situation across the region.
- Given Israel's non-dependency on oil and it being relatively less impacted due to the pandemic, it might emerge stronger out of the pandemic.

India:

- The economic downturn might reduce India's room for manoeuvring in global affairs.
- The increasing Chinese investment in South Asia could see its influence grow in the South Asian region and diminish India's influence in the region.
- India's leverage in West Asia will suffer due to the declining oil prices.
- The large Indian expatriate community in West Asia would be severely affected and may seek repatriation back to India. This would substantially reduce the inflow of foreign funds to India from the region.

Conclusion:

The COVID-19 pandemic is unprecedented, involving as it does far too many variables. The very complexity of the novel coronavirus leads to radical uncertainty. Hence, it is unlikely that the world will ever be the same again. Thus, there is a need for the global community to work together by taking all the countries into confidence and supporting them. **Together we stand, divided we fall** – the adage holds perfectly apt for the coming times.

Role of external state and non-state actors in creating challenges to internal security.

The outbreak of the COVID-19 pandemic and subsequent countrywide lockdown to prevent its transmission have variedly impacted the Indian Maoists. Critically examine. (250 words)

Reference : idsa.in, [Economic Times](https://www.economic-times.com)

Why this question:

the lockdown has certainly increased Maoists' desperation to meet their demands of food supplies and other essentials. Maoists, all across the left wing extremism (LWE)-affected states, primarily procure their rations and other essential commodities through a network of aides from village-level haat bazaars (weekly markets). With haat bazaars being temporarily shut, they are reportedly facing acute shortage of food supplies. Also, since the entire economic and construction activities have been grounded in these areas to ensure the efficacy of the lockdown, the Maoists' finances have taken a beating given that extortions from contractors, mining industry, truck drivers, etc., formed a major part of their finances.

Key demand of the question

One needs to examine how the COVID-19 lockdown has halted the finances and other support system to the Maoists, leading to increased pressure on the villagers nearby. Also one needs to talk about how this has led to variations in the form of attacks as seen in Sukma recently, while a faction of Naxals have apparently called for truce with the government authorities.

Directive word

Critically examine – When asked to 'Examine', we have to look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications. When 'critically' is suffixed or prefixed to a directive, all you need to do is look at the good and bad of something and give a fair judgement.

Structure of the answer

Introduction:

In a few introductory lines briefly discuss the COVID-19 lockdown across nation and how it has affected the supplies of goods and services across the nation to one and all.

Body:

The question must discuss the following points:

How the naxals are affected due to the lockdown and breakage in supply of goods and services.

The ramifications of the same in the form of attacks on the security forces, threats on the local villagers, headmen of village, exploiting the villagers for meeting their ends etc.

Also on the other hand, how a faction of naxals are calling for a truce with the government.

Also discuss why there is a need to remain cautious with respect to internal security and measures to attain the same.

Conclusion:

Give a balanced way forward.

Introduction:

Naxalism is considered to be one of the biggest internal security threats India faces. Naxal violence is related to the intensity of the feeling of people of their deprivation and their commitment to take revenge against those who are believed to be responsible for such denial. Recently, 17 security personnel killed in Sukma Maoist attack in Chattisgarh.

The outbreak of the COVID-19 pandemic and subsequent countrywide lockdown to prevent its transmission have variedly impacted the Indian Maoists. While there are no verified inputs that suggest confirmed cases of coronavirus among their cadres, the lockdown has certainly increased Maoists' desperation to meet their demands of food supplies and other essentials.

Body:

Impacts on Maoists:

- Maoists, all across the left wing extremism (LWE)-affected states, primarily procure their rations and other essential commodities through a network of aides from village-level haat bazaars (weekly markets).
- With haat bazaars being temporarily shut, they are reportedly facing acute shortage of food supplies.
- Also, since the entire economic and construction activities have been grounded in these areas to ensure the efficacy of the lockdown, the Maoists' finances have taken a beating given that extortions from contractors, mining industry, truck drivers, etc., formed a major part of their finances.

The resulting impacts on the villagers and tribals:

- The Maoists are reported to have devised a few coping mechanisms to overcome the impact of the lockdown on their supplies of rations and finances, albeit in a minuscule way.
- The Maoists in Bastar are forcing the village headmen and others to arrange rations for them. Places where villagers are unable to arrange large stocks of rice, the Maoists are snatching a one-month free ration from each of the below poverty line (BPL) families.
- The Maoists are also allegedly transporting stranded migrant workers to their respective villages in lieu of money.
- The lockdown situation has increased Maoists' desperation and they are exploiting the villagers for meeting their ends.

Truce call by a few Maoists' to overcome the effects of lockdown:

- The Maoists had reportedly offered a temporary unilateral ceasefire early this month in the states of Andhra Pradesh and Odisha, especially in the regions falling under Andhra Odisha Border Special Zonal Committee (AOBSZC).

- While the Maoists' refrain is to 'facilitate government's relief operations in their core areas to fight COVID-19', it is believed that the offer is opportunistic and misleading.
- The factors that might have influenced the Maoists' decision to initiate a truce call are: achieving a possible breather in hitherto intensified security offensive in their core areas, and the increased social pressure to pave the way for COVID-19 relief operations in remote villages, which otherwise might increase the miseries of the underprivileged masses.
- The veracity of the truce call is also debatable as it has not come from the all-powerful Central Committee of the Communist Party of India (Maoist) or CPI (Maoist).

But challenges remain:

- Moreover, the Maoists have not relented on their violent campaigns in the most affected states of Chhattisgarh, Jharkhand and Bihar.
- The Maoist ambush of March 21-22, wherein 17 security personnel were killed and 15 others severely injured in Chhattisgarh's Sukma District is a case in point.
- The Maoists are, in fact, shoring up their strength and preparing for future operations.
- They are reportedly holding village-level meetings and recruiting ground-level forces in the remote villages of Jagdalpur, Dantewada, and Sukma districts.
- It is believed that the Maoists could also offer money and enlist the jobless migrant workers returning to their villages.
- Recently, a large group of armed Maoists from Andhra Pradesh, Telangana, Maharashtra, Jharkhand, Odisha and West Bengal has reportedly joined their Bastar colleagues to up the ante against the security forces.
- They are torching road construction vehicles, digging up the roads that lead to the strategically important police camps in remote villages and planting landmines on the deserted lanes to target the security patrols.
- Besides, the Maoists' recent forays in the areas of Todma and the Dantewada-Katekalyan main road are testimony of their increased activities during the lockdown.

Measures needed:

- **Good governance:**
 - The presence of Naxals in the country also reveals the loopholes in the law and order of the country which has failed to curb the menace.
 - Central government needs to implement a coherent national strategy to end Naxalism.
- **Dialogue:**
 - Dialogues between the Naxal leaders, and the government officials can be a way work out a solution.
 - The government should initiate sincere dialogue with Naxalites.
- **Generate more employment and increase wages:**
 - Insecure livelihood and unemployment in the areas have left the people with no option but to join the Naxals.
 - If we are actually thinking of ways to end Naxalism, we'll first have to provide the people of the area with proper employment opportunities with increased wages

- **Rehabilitation and resettlement:**
 - mining grounds, irrigation areas, industries, etc., in the area without any provision for the resettlement of the displaced people has only added to the woes of the poor
 - There needs to be more emphasis on rehabilitation of these affected population
- **Prevent environmental degradation:**
 - Environmental degradation in the form of destruction of land and water resources due to mining and industrial activities
 - The locals are left with disrupted lives and adversely affecting tourism
- **Stop the political marginalization of weaker sections**
 - Weaker sections of the society, the schedule castes and schedule tribes still face discrimination from the upper class.
 - These downtrodden sections don't enjoy equal participation in casting and contesting politically, making them soft targets of Naxals.
- **Remove disparity:**
 - Economic disparity and the growing distance between rich and the poor is one of the main problems that has contributed to the growth of Naxalism
 - This distance needs to be filled to an extent hastily to stop Naxalism
- **Let ordinary citizens have access to basic resources**
 - One of the major reasons for unrest is the exploitation of forest and lands of the tribal people for industrial purposes.
 - The loss of land and the lack of basic facilities like education, freedom, sanitation and food
- **Take steps for welfare of the tribals:**
 - The socially backward tribals form the major support base for Naxalites because of inequality, illiteracy and lack of opportunities.
 - It's important to prevent these people from falling in the Naxal trap.
- **Modernize law enforcement agencies:**
 - the major policing lies in the hands of the state governments
 - At federal level, many agencies are under the command of Union Ministry of Home Affairs
 - Central government must inroads into these disturbed states with their agencies well-equipped with modern artillery and assist the usually poorly-equipped agencies of the state.

Need of the Hour:

- Central and State governments, the administration and the security establishment need to recognise that the movement cannot be approached from a purely law and order point of view.
- The process of improving the conditions of the poor and the tribals clearly need to be speeded up if the movement is to be effectively checked.

- Winning the hearts and minds of the tribal population and other marginalised groups will lie at the core of the counter-insurgency strategy
- Development of road and rail infrastructure will not only enhance economic growth and development but will also help in countering Maoist propaganda
- The improved road connectivity will also have a multiplier effect on the effectiveness of the security forces in carrying out operations.
- Providing incentives and alternate life support system to those surrendered

Conclusion:

Through a holistic approach focusing on development and security related interventions, the LWE problem can be successfully tackled. Civil society and the media should build pressure on the Maoists to eschew violence, join the mainstream and recognise the fact that the socio-economic and political dynamics and aspirations of 21st Century India are far removed from the Maoist world-view. An ideology based on violence and annihilation is doomed to fail in a democracy which offers legitimate forums of grievance redressal.

Security challenges and their management in border areas - linkages of organized crime with terrorism.

Despite upsurge in exports and cut in imports of Defence equipment, India's Defence sector remains uncompetitive globally. Examine.(250 words)

Reference: [The Hindu](#)

Key demand of the question:

According to latest estimates released by the Stockholm International Peace Research Institute (SIPRI), the Indian defence exports have increased and defence imports have decreased during the period between 2009-13 and 2014-18. Thus the question.

Directive:

Examine – When asked to 'Examine', we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Briefly put forth the background of the question.

Body:

To start with, discuss why India's defence model faces challenges despite the positive trends generated by 'Make in India'. Discuss the positives and negatives of Make in India drive. Explain the factors contributing to falling imports apart from the make in India concept; Indian defence acquisitions have also fallen due to the cancellation of big-ticket items. SMEs still face stunted growth because India's defence industrial model is at odds with global trends in that it tends to create disincentives for the private sector. Suggest upon the current export trends. Thus, from a volume and value standpoint, Indian defence exports, while showing a promising upward trend has failed to meet desired success globally. To help ideas meet action, there is a need to create an environment for greater participation of private industry.

Conclusion:

Conclude that to ensure that 'Make in India' initiative reaches its full potential, focus should be laid on export promotion/facilitation and export regulation.

Introduction:

Indian defence sector has been largely dependent on foreign imports. However, this trend is not in the long term Security interest of the Nation. However, the trend has been changing in recent times. According to the latest estimates released by the Stockholm International Peace Research Institute (SIPRI) in the period between 2009-13 and 2014-18, Indian defence imports fell even as exports increased.

Body:**Reasons for India's reduced imports:**

- **Make in India initiative**

- Defence Procurement Procedure, 2016 lays out measures necessary for building India's defence Industry
- A new category called 'Buy Indian Indigenously Designed, Developed and Manufactured' (IDDM) was created under DPP-2016 which was given highest preference in defence procurement.
- For imported defence goods, its Components & service parts from Indian enterprises (private & public sector) have been prioritised by the government
- Simplifying "Make" procedures especially for MSMEs to encourage indigenous defence production
- Relaxed norms that makes private partners eligible for technology transfers so as to boost their capabilities.
- In 2018-19, the three armed services sourced 54% of their defence equipment from Indian industry for their combined capital and revenue expenditures

- **Contribution by SMEs:**

- Small and Medium Enterprises (SMEs) until 2016 accounted for 17.5% share of the Indian defence market.
- According to government of India data for the financial year 2018-19, the three armed services for their combined capital and revenue expenditures sourced 54% of their defence equipment from Indian industry.

- **Cancellation of defence contracts:**

- Government has cancelled the defence contracts which led to significant reduction of import bill
- In 2015, government reduced the size of the original acquisition of 126 Rafale Medium Multi-Role Combat Aircraft (MMRCA) from Dassault to 36 aircraft, which is also responsible for significantly driving down the import bill.
- India-Russia joint venture for the development of the advanced Su-57 stealth Fifth Generation Fighter Aircraft (FGFA). India cancelled involvement in 2018 due to rising dissatisfaction in delays with the project as well as the absence of capabilities that would benefit a fifth generation fighter jet.

- **Public sector contribution:**

- Among arms producers, India has four companies among the top 100 biggest arms producers of the world.
 - It is estimated, according to SIPRI, their combined sales were \$7.5 billion in 2017, representing a 1% jump from 2016.
 - The largest Indian arms producers are the Indian Ordnance Factories and the Hindustan Aeronautics Limited (HAL), which are placed 37th and 38th, respectively, followed by Bharat Electronics Limited (BEL) and Bharat Dynamics Limited (BDL). All four of these companies are public sector enterprises and account for the bulk of the domestic armament demand.
- **Delays in supplying equipment:**
 - Delays in supplying of equipments by vendors also led to falling imports.
 - For instance, T-90 battle tanks & Su-30 combat aircraft from Russia; Submarines from France

Reasons for rise of defence exports

- In the last two fiscal years, 2017-18 and 2018-19, exports have witnessed a surge from ₹7,500 crore to ₹11,000 crore, representing a 40% increase in exports.
- Removal of export barrier: Government has removed several products that were earlier restricted from exports
- Government dispensed with the No Objection Certificate (NOC) under the DPP that restricted exports of aerospace products & several dual-use items

Way forward:

- To boost indigenization, DRDO needs to be given more autonomy like space and atomic energy departments
- With opening up of 100% FDI in defence sector, giving private players an opportunity would bring in the money as well as competition to the Defence PSUs.
- Setting up of the planned defence industrial corridors.
- Robust Defence Diplomacy, for which a cadre of defence diplomats should be created so that new co-ordination with world can bring new idea and innovations.
- Setting up of a Defence Export Organization to promote export of defence equipments.
- Instituting an Independent Audit addressing issues of inefficiency and accountability, this shall help in keeping the flow of ideas and innovation.
- Setting up an aerospace university, can help in bringing new ideas and innovations

Conclusion:

Thus, from a volume and value standpoint, Indian defence exports, while showing a promising upward trend has failed to meet desired success globally. To help ideas meet action, there is a need to create an environment for greater participation of private industry. To ensure that 'Make in India' initiative reaches its full potential, focus should be laid on export promotion/facilitation and export regulation.

“Biological weapons are gradually being recognized as one of the crucial future threats to international security”, do you agree? Comment. (250 words)

Reference: [Financial Express](#)

Introduction:

Biological weapon, also called **germ weapon**, any of a number of disease-producing agents—such as bacteria, viruses, rickettsiae, fungi, toxins, or other biological agents—that may be utilized as weapons against humans, animals, or plants. Biological weapons, like chemical weapons, radiological weapons, and nuclear weapons, are commonly referred to as weapons of mass destruction, although the term is not truly appropriate in the case of biological armaments. Lethal biological weapons may be capable of causing mass deaths, but they are incapable of mass destruction of infrastructure, buildings, or equipment.

Body:

The UN chief, in his message on the 45th anniversary of the Biological Weapons Convention’s entry into force, said that all countries should reaffirm their unequivocal rejection of the use of disease as a weapon.

Challenges posed by bioweapons:

- The technology associated with the manufacture of biological weapons is relatively inexpensive, and because it is similar to that used in vaccine production facilities, it is easy to obtain.
- The microbial agents needed for most biological weapons are widely available.
- It is difficult to gauge the extent of biological weapons development in other nations since production facilities require little space and are not easy to identify.
- For instance, the acquisition and dissemination of even the most highly restricted organism, Variola major, is not an implausible scenario.
- There is growing concern that biological weapon designs or materials from this program might find their way to other nations or terrorist groups.
- Finally, the series of revelations following the Gulf War regarding the true capacity and scope of Iraq’s biological weapons program has been alarming.
- In addition to creating many tons of pathogens and toxins, including B. anthracis and C. botulinum toxin, Iraq also admitted that it had loaded bombs and missiles with biological agents

Impact of Bioterrorism:

- Bioweapons offer terrorist groups and “rogue states” like Pakistan that are waging an unconventional war against the Indian government for the last three decades an affordable way to counter India’s overwhelming military superiority.
- Genetic maps of deadly viruses, bacteria and other microorganisms are already broadly available in the public domain.
- In effect, biological warfare is using non-human life to disrupt — or end — human life. Because living organisms can be unpredictable and incredibly resilient, biological weapons are difficult to control, potentially devastating on a global scale, and prohibited globally under numerous treaties.
- The threat of bioterrorism is increasing as a result of the rise of technical capabilities, the rapid expansion of the global biotechnology industry, and the growth of loosely sophisticated networks of transnational terrorist groups that have expressed interest in bioterrorism.

**Measures needed to control Bioweapons:**

- Existing prevention strategies are insufficient to guarantee that biological weapons will not be used. Furthermore, it is clear that biological weapons are proliferating.
- **Awareness and education:**
 - ID professionals are called on every day to diagnose and treat patients with fever, pneumonia, rash, and flulike symptoms; therefore, it is the ID professional who would be among the clinicians most likely to recognize the diseases caused by biological weapons.
 - Professional educational and training curricula should be enhanced so that ID professionals are better capable of recognizing the diseases that would follow use of a biological weapon such as anthrax, plague, or smallpox.
- **Laboratory diagnosis:**
 - Should the recognition of an unusual disease or pattern of illnesses prompt consideration of possible biological weapon use, members of the ID community will be called on to advise upon the most rapid procedures for diagnostic confirmation of disease.
 - In anticipation of this, ID experts should become familiar with the processes by which either the hospital laboratory or the local or state health department, in consultation with the Centers for Disease Control and Prevention (CDC) as necessary, will perform diagnostic studies to implicate or exclude biological weapons use.
- **Systems for distributing therapeutics:**
 - Should a biological weapon use be confirmed, treatment and intervention strategies for the ill and for the exposed but not yet ill will be critical. Depending on the disease, antibiotics, and/or vaccines or other therapies, as well as quarantine, could be lifesaving.
- **Scientific research:**
 - The ID community already does research that seeks new strategies for diagnosis, prevention, or treatment for infectious disease.
 - Commensurate with this, the ID community might elect to encourage and reward basic science research efforts that seek to produce novel diagnostic technologies, preventive, or therapeutic interventions for the diseases caused by biological weapons.

Way forward for India:

The Indian government along with friendly nations need to pool their resources and make major investments in the research and development of state-of-the-art devices that are capable of instantaneously detecting lethal bacteria and viruses in the environment. Clinical labs capable of deploying cutting edge technologies need to be set up. Also, the production and stockpiling of new vaccines needs to be increased. A surveillance system should be set up nationwide that should be staffed with clinicians and veterinarians who are trained to identify a bioweapon attack immediately after such a weapon is unleashed. Advanced countries like the Netherlands and Israel have already initiated such steps. Consequently, a nationwide response plan against any bioweapon attack is in place.

Challenges to internal security through communication networks, role of media and social networking sites in internal security challenges, basics of cyber security; money-laundering and its prevention.

What do you understand by round tripping? Discuss the concerns associated and suggest ways to address them. (250 words)

Reference: [The Hindu](#)

Why this question:

In a major relief for New Delhi Television Limited (NDTV), the Supreme Court has quashed an income tax re-assessment notice issued by revenue authorities against the premier news broadcasting company. Thus the question.

Key demand of the question:

Explain the concept of round tripping and discuss the concerns associated and suggest ways to address them.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly define round tripping. Discuss the concerns associated and suggest ways to address them.

Body:

Round tripping refers to money that leaves the country through various channels and makes its way back into the country often as foreign investment. This mostly involves black money and is allegedly often used for stock price manipulation. Round tripping is often done through a series of transactions that don't have any substantial commercial purposes, which makes it fall within the trappings of GAAR. List down the concerns associated with round tripping. Detail upon the efforts being taken the government in this direction.

Conclusion:

Conclude by suggesting measures to tackle them.

Introduction

Round tripping refers to money that leaves the country through various channels and makes its way back into the country often as foreign investment. This mostly involves black money and is allegedly often used for stock price manipulation. It is also a money laundering and tax evasion technique.

Round tripping is often done through a series of transactions that don't have any substantial commercial purposes, which makes it fall within the trappings of **GAAR**.

Body

Round Tripping: Concerns

- Round-tripping is a method used to show an increase in volume in a thinly traded stock.
- It is also known as round-trip transactions or 'Lazy Susans' and is a characteristic of the New Economy companies.
- **It is a market-manipulation practice** used to misrepresent the number of transactions occurring on any given day. This leads to loss of tax-revenue to the governments.
- Companies used round-tripping to distort the market by establishing false revenue benchmarks, aiming to meet or beat the numbers.
- Round-trip trading **artificially inflates volume and revenues**, but in reality, it **adds no profit**.

- It is a form of barter that involves a company selling “an unused asset to another company, while at the same time agreeing to buy back the same or similar assets at about the same price.
- This process is sometimes **used as a means of increasing the apparent amount of sales and revenue generated** by the seller during a specific financial period.
- Round trip stock trading is one method that companies use to deceptively increase income. It is also a method used to show an increase in volume in a thinly traded stock. Most of the time, round trips occur when the person is a day trader.
- **SEBI** had recently issued a notice against listed firms including United Spirits, GMR, Unitech and Sterlite for investing in group companies through a foreign account held with UBS. The companies are alleged to have indulged in stock price manipulation and insider trading through this route.
- **Stakeholder interest:** If a company is under the regulator’s radar for round-tripping allegations, it implies the possibility of poor corporate governance. Putting money into such stocks may contain high risk of unravelling and eventual collapse.

Addressing problems of Round Tripping

- The government amended the **tax treaty with Mauritius in 2016**, removing the tax arbitrage on capital gains. Under **POEM (place of effective management) rules**, overseas subsidiaries are treated as domestic entities for tax purposes if they are controlled and managed from India.
- As per RBI notification, Indian company can’t acquire stakes in an offshore firm which has already invested in an Indian entity “under the automatic route”.
- The data under **Foreign Exchange Management Act of 1999 (FEMA)** indicates non-reporting or delayed reporting by many, including large companies, for both FDI and OFDI. It must be amended for monitoring and reporting by the companies.
- India must sign **information disclosure agreements with tax havens** such as Mauritius, Cyprus and such other countries to monitor round-tripping of funds.
- **Information exchange** will help with monitoring the investments especially post the extension of the automatic route to OFDI (Outward foreign direct investment).
- **More powers to RBI and SEBI regulators** for probing cases of round-tripping.
- Agreement on **stringent KYC norms** by the countries involved can help in tracking the route of investments and impose taxes accordingly.

It must also be ensured that investigation must not lead to harassment despite following the law of the land. Proper guidelines and clear laws can ensure Ease of Doing Business in India as well as attract investments from foreign companies and investors.

Conclusion

Round Tripping makes the government lose large amount of revenue. Round tripping is not regarded to serve any purpose apart from aiding in the evasion of tax in India. Round tripping is not prohibited under Indian laws as of now. It is, however, argued that such a practice severely impacts revenues from capital gains tax. India must go for taking the course of law, to ensure there is no evasion of tax.

Deliberate upon the case of ‘infodemic’ of misinformation and cybercrime amidst the COVID-19 pandemic.(250 words)

Reference: [Indian Express](https://www.indianexpress.com)

Why this question:

The author highlights the fact that it is time for the digital leaders to flatten the curve of the infodemic. Thus the question.

Key demand of the question:

Explain what is an infodemic and how does it lead to misinformation and cybercrimes; illustrate using the present case of COVID-19.

Directive:

Deliberate – Weigh up to what extent something is true. Persuade the reader of your argument by citing relevant research but also remember to point out any flaws and counter-arguments as well. Conclude by stating clearly how far you agree with the original proposition.

Structure of the answer:

Introduction:

Define what constitutes an 'Infodemic'.

Body:

From selling fake coronavirus cures online to a cyber-attack on hospitals' critical information systems, criminals are exploiting the COVID-19 crisis.

Infodemics are an excessive amount of information about a problem, which makes it difficult to identify a solution. They can spread misinformation, disinformation and rumors during a health emergency. Infodemics can hamper an effective public health response and create confusion and distrust among people. Explain then the importance of awareness, role of media, cyber security etc.

Conclusion:

Conclude that we are fighting an 'infodemic'. Our common enemy is a virus, but our enemy is also a growing surge of misinformation. So to overcome this virus, we need to urgently promote facts and science. We also need to promote hope and solidarity over despair and division.

Directive:

Deliberate – Weigh up to what extent something is true. Persuade the reader of your argument by citing relevant research but also remember to point out any flaws and counter-arguments as well. Conclude by stating clearly how far you agree with the original proposition.

Structure of the answer:

Introduction:

Define what constitutes an 'Infodemic'.

Body:

From selling fake coronavirus cures online to a cyber-attack on hospitals' critical information systems, criminals are exploiting the COVID-19 crisis.

Infodemics are an excessive amount of information about a problem, which makes it difficult to identify a solution. They can spread misinformation, disinformation and rumors during a health emergency. Infodemics can hamper an effective public health response and create confusion and distrust among people. Explain then the importance of awareness, role of media, cyber security etc.

Conclusion:

Conclude that we are fighting an 'infodemic'. Our common enemy is a virus, but our enemy is also a growing surge of misinformation. So to overcome this virus, we need to urgently promote facts and science. We also need to promote hope and solidarity over despair and division.

Introduction:

Infodemic refers to an excessive amount of information concerning a problem such that the solution is made more difficult. Some experts believe that an infodemic, or an excessive amount of both correct and incorrect information, is spreading around the world. The worst-case scenario is that inaccurate information is potentially spreading faster than the virus itself, causing people to make poorly informed decisions. The WHO has declared misinformation and fear as some of the biggest challenges they face with the new coronavirus.

Body:

Challenges posed by Infodemic:

- WHO is leading the effort to slow the spread of the 2019 coronavirus disease (COVID-19) outbreak.
- But a global epidemic of misinformation—spreading rapidly through social media platforms and other outlets—poses a serious problem for public health.
- every outbreak will be accompanied by a kind of tsunami of information, but also within this information you always have misinformation, rumours etc,
- But the difference now with social media is that this phenomenon is amplified, it goes faster and further, like the viruses that travel with people and go faster and further.
- In a country such as India, where 400 million turn to a single messaging app for sharing news and stories about any and everything, more than 240 million are on Facebook and, often, using it as the predominant source of news, a critical mass of misinformation leads to misdirected behaviours.
- In times of crises, cybersecurity is critically important, he stressed, adding that a huge number of people under lockdown or movement restrictions are now working and studying remotely, making them susceptible to cybercrime.
- Some instances are hard to ignore some dominant narratives: Bioweapons origins of the coronavirus (false); Bill Gates was behind it (false); UNICEF's recommendations for warding off infection (unauthorised).

Measures taken up:

- Immediately after COVID-19 was declared a Public Health Emergency of International Concern, WHO's risk communication team launched a new information platform called **WHO Information Network for Epidemics (EPI-WIN)**, with the aim of using a series of amplifiers to share tailored information with specific target groups.
- WHO is also working closely with UNICEF and other international agencies that have extensive experience in risk communications, such as the International Federation of Red Cross and Red Crescent Societies.
- Social-media companies must sort, rank, and prioritize true and reliable information now more than ever.
- Web companies such as Pinterest have already introduced headers and links on their homepages with information about Covid-19, for example.

Way forward:

- Maintaining a system of fact-checking and tough standards regarding COVID-19 and weeding out messages, hashtags and transmitters that fail to meet them.
- The traditional media has a key role in providing evidence-based information to the general public, which will then hopefully be picked up on social media.

- For both social and conventional media, it is important that the public health community help the media to “better understand what they should be looking for, because the media sometimes gets ahead of the evidence”.
- We, as users, have a responsibility to find better ways to seek advice or substitutes for that dopamine rush of sharing a message instantly liked, commented on and shared by others.
- As a society, much like our global response to the coronavirus, we cannot rely on bottom-up decisions.
- We need decisive leadership from the top. In the digital nations we inhabit, Facebook, Facebook-owned WhatsApp, YouTube, Twitter, TikTok, it is imperative that the leaders of these nations act – and act now.
- It is about time, Mark Zuckerberg (Facebook/WhatsApp), Sundar Pichai (Google/YouTube), Jack Dorsey (Twitter) and Zhang Yiming (TikTok) made some tough calls, much like what their own political leaders have done.
- It would be more useful if instead of a coy “Forwarded” note, WhatsApp had a note that said, “For Reliable Medical Advice, Check Out the WHO” or some other trustworthy medical authority

Conclusion:

It is time to step up and help us all practise social media distancing by enforcing stricter standards. Beyond India, the entire developing world relies on your platforms for news about the pandemic. If there ever was a time to demonstrate vision and leadership, this is the time for the digital leaders to flatten the curve of the infodemic before it flattens the most vulnerable populations on the planet.

Who is to blame for the menace of rumors? Is it a policy issue or is it due to the lackadaisical approach by the social media companies or is it a combination of both?

Discuss. (250 words)

Reference: [The Hindu](https://www.thehindu.com/news/national/article3648447.ece)

Why this question:

The article discusses the threat of fake news to the efforts against COVID-19 and the necessary measures to tackle it. Thus the question.

Key demand of the question:

Explain the menace of rumors, discuss the reasons causing it and suggest measures to address them.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly discuss the context – Misinformation linked to supposed cures for COVID-19 and misleading claims have proliferated on social media networks.

Body:

To start with, explain the dangers posed by inaccurate information. Discuss the reasons that often lead to creation of such rumors – misinformation, explain whether it’s a policy issue or is it due to the lackadaisical approach by the social media companies or is it a combination of both. Take a balanced stand and give your opinion with suitable justifications.

Conclusion:

Conclude with way forward.

Introduction:

A rumour is an untested piece of information, opinion, report or story. Therefore, its veracity is doubtful. This unverified, ambiguous status is at the heart of a rumour, making it largely what it is. The moment an account is publicly demonstrated and accepted to be true or false, it ceases to be a rumour. In a sense then, a rumour's truth or falsity is irrelevant to its efficacy or impact.

Periods of social stress or natural disasters are fertile ground for rumours, which not only spread like wild fire but have grave consequences — scapegoating, social boycott, violence and arson, even lynching and murder.

Body:

Previous instances of rumour mongering during crisis:

- 1984 Pogrom against Sikhs
- For Centuries rumours were created against Jews, who were falsely accused of poisoning wells during wars, epidemics or civil unrest.
- In late 18th century Paris was replete with the rumour that the rich had distributed lethal, contaminated flour to the poor.
- It is no surprise then that during the current COVID-19 pandemic, the rumour mill has Muslims deliberately throwing infected Rs. 2,000 notes on the road or Muslim street vendors spitting on vegetables and fruits.

Factors that lead to menace of rumours:

- **Situations of information void or information overload:** Unable to satisfactorily make sense of their world in these uncertain contexts, humans become cognitively unstable and anxious. To meet their cognitive needs, they are forced to rely on bits and pieces of available knowledge, on a patchwork of half-truths, a rag bag of allusions that together provide a fragile, uncorroborated framework for interpreting events.
- **emotional anxiety:** when added to this cognitive framework, and one has a ready-made arena for rumours to flourish. An overheated mind burns all evidence that comes its way and surrenders to rumours, often in the service of emotional needs. During demonetisation, amidst despair and anxiety at losing their own money, the poor still found emotional satisfaction in the rumour that crores of rupees secretly stored in cash by the rich were rendered worthless.
- **Acute Crisis Situation:** In times of acute crisis, people lean on knee jerk speculation and prejudice. A group consisting of 'outsiders', already distrusted and disliked, becomes an easy target, ready to be blamed for the current mess
- **Polarized Societies:** In polarized societies, fear and vulnerability make rumour mongering easy.
- The desire to conform gets the better of a questioning mind. Rather than face sanction and ostracization for sticking out, people find it safer to emulate members of their group.
- Ironically, a belief gets entrenched after like-minded people discuss it among themselves. Discussion has a cascading effect; the more one talks about it, the more the biased rumour grows.
- A denial by a mistrusted outsider, no matter how great her expertise, only ends up solidifying rumours. Group dynamics in polarised societies works with a logic all of its own; every person is necessarily partisan. A neutral ground for impartial voices is simply unimaginable

Way forward:

- To transform the conditions that are conducive to rumours. This can reduce their efficacy.

- Depolarizing society, loosening the grip of prejudice and calmly addressing the collective anxieties and obsessions of a group are deterrents, but, alas, only in the long run.
- Regulatory laws to check rumours are imperative in the short run.
- The community leaders and democratically elected office holders can play an important role. They should vehemently deny injurious rumours and reduce its propagation and spread.
- Social media companies should support the government by tracking such rumours and quickly removing it from their platforms.

Social media often acts as a petri dish for rumors and delusions that can go viral and infect the minds of millions, examine and suggest what needs to be done to overcome the challenges of social media.(250 words)

Reference: [India Today](#), [Economic Times](#)

Why this question:

Few videos, purportedly of the gruesome incident of the Palghar mob lynching have gone viral on social media. The disturbing visuals have resulted in nationwide outrage with hash tags like Palghar and lynching trending on Twitter in India.

Key demand of the question:

One must bring out the evil side of the social media – explain in what way it often acts as a petri dish for rumors and delusions that can go viral and infect the minds of millions. Suggest measures to address the issue involved.

Directive:

Examine – When asked to ‘Examine’, we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Briefly explain the context, discuss the increasing use of social media with respect to rumors and delusions.

Body:

To start with, explain what constitutes social media. Discuss the role played by it; positives and negatives, explain how it is different from the print media and the regulated media. Discuss that Rumours tend to rise in times of uncertainty, Unlike more harmless rumors, conspiracy theories centre on a rejection of mainstream ideas and common sense in favour of a more sinister and secret narrative. Discuss some recent examples justifying the statement in question. Suggest measures to address the problem.

Conclusion:

Conclude with way ahead.

Introduction

The world has been battling a deluge of misinformation and influence operations for a long time now. The advent of internet, social media platforms and real time messengers has given a free run to criminals, miscreants, nation states and other motivated actors. In fact, society, today is experiencing something called an ‘information disorder’ where it has become extremely difficult to disambiguate truth from falsehood.

Body

Role of social media

There are more than **500 million internet users** in India and today social media is not only a subset of internet rather the internet itself.

Positives

- Social media has the potential to aid public servants in their work – not only for promotional activities, but also as a “grievance redressal” mechanism. **Eg:** Many outreach programs were possible during covid-19 pandemic after users complained on social media.
- **Outreach:** Given its characteristics to potentially give “voice to all”, immediate outreach and 24*7 engagement, Social Media offers a unique opportunity to governments (civil servants) to engage with their stakeholders especially citizens in real time to make policy making citizen centric.
 - Eg: PM Modi disseminating info on social distancing and government measures through Twitter.
- **Real Time engagement:** Social Media releases the shackles of time and place for engagement. They can connect policy makers to stakeholders in real time.
- **Managing Perceptions:** One of the big challenges for government is to avoid propagation of unverified facts and frivolous misleading rumors with respect to government policies. Leveraging these platforms can help to counter such perceptions and present the facts to enable informed opinion making. **Eg: Asking citizens to read information from trusted websites, downloading government apps etc.**

Misinformation through social media

- **Creating fear and Panic:** A small indiscretion of forwarding an unverified message can lead to loss of life or cause a serious disturbance of public order.
 - With governmental and public resources pushed to limits, it is incumbent upon the general public to perform diligence in their interactions with reference to the Pandemic.
 - On April 16, a group of villagers in Palghar district of Maharashtra dragged out three men out of their car and beat them to death on suspicion that they were thieves. The attack on the three took place amid a nationwide lockdown.
- **Communalizing the pandemic:** The Tablighi incident during the coronavirus pandemic added fuel to already tense environment in Delhi and elsewhere. News regarding the same circulated widely on social media, unabated, further giving the pandemic a communal color.
- **False remedies** such as distributing unchecked concoctions, medicines and herbs at egregious prices to unsuspecting innocent people online . It may lead to worsening the underlying conditions in people and endanger their lives.
- **Accountability issues:** Challenges with respect to fixing the liability of intermediaries. It is also difficult to trace the origin of fake news circulation.
- **Jurisdictional challenges:** Complications in jurisdiction as Facebook, twitter etc. operate as subsidiaries of foreign internet companies with their servers located outside India.
- **Anonymity:** Police officers have expressed concern over multiplicity of fake profiles. There is no accountability of a crime.
- **Encrypted Message:** Use of whatsapp to send and receive messages, concerns the government because the communications sent via such devices and applications are encrypted.

Measures to be taken

- **Strict Law enforcement: Section 505(1) of Indian Penal Code, 1860:** The punishment for making, publishing or circulating any statement, rumour or report which may cause fear or alarm to the public, or to any section of the public.
 - **Section 66D of Information Technology Act:** Whoever, by means for any communication device or computer resource cheats by personating. Punishment includes imprisonment of for a term which may extend to three years and shall also be liable to fine which may extend to one lakh rupees.
 - **Section 54 of the Disaster Management Act, 2005:** Whoever makes or circulates a false alarm or warning as to disaster or its severity or magnitude, leading to panic. Punishment is Imprisonment which may extend to one year or with fine.
- Ascertaining the source and origin of the message. If one is not sure of the authenticity and correctness of the message or its content, one may make attempts to be sure of the veracity of the matter before forwarding it to others.
- In case of any claims made in the message one has received, conduct secondary checks on google or other sites before disseminating it.
- If the message incites strong emotions, it is likely to be sent for such purposes. Any shocking or outrageous claim made needs to be verified before it is sent to others who may believe it completely.
- In case of the message containing videos or pictures, there is a possibility of them being edited or used out of context to mislead unsuspecting recipients. A simple reverse image search on google can reveal the original source and context of the picture. Any harm resulting from such forwarding can make the person doing so liable to legal consequences.
- Use factchecking services, there are many reputed factchecking sites, which help people to verify claims made on social media or messages which have gone viral. **Eg : Whatsapp checkpoint Tipline, The logical Indian.**
- Sometimes there would be obvious spelling, punctuation mistakes or other grammatical errors which can point out the inauthenticity of the message. One needs to develop a healthy scepticism towards content on social media.
- The recent initiative of WhatsApp's launching of a 'Coronavirus Information Hub' in partnership with International Fact-Checking Network (IFCN), World Health Organization (WHO), United Nations Development Programme (UNDP) and United Nations Children's Fund (UNICEF) is an appreciable move.

Conclusion

The state and its different enforcement apparatus have to remain ever vigilant in the online and virtual worlds to protect individuals and society from the lurking dangers of an **Infodemic**. This entails timely detection of content before it goes viral and causes widespread damage, taking it down with the help of social media platforms and intermediaries and tracing the sources of such mischief. Media outlets and the press also have an enhanced responsibility to make people aware and increase literacy about the menace of fake news and misinformation.

Discuss the critical role being played by Food Corporation of India in countering the challenges posed by COVID-19.(250 words)

Reference: [The Hindu](#)

Why this question:

The article presents the FCI's role in the pandemic crisis.

Key demand of the question:

Explain in detail the critical role being played by Food Corporation of India in countering the challenges posed by COVID-19.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Present a brief background of FCI and its functions.

Body:

The Food Corporation of India (FCI) has been set up under the Food Corporations Act 1964. In the initial decades of its inception, the FCI was praised for being at the forefront of India's quest for self-sufficiency in rice and wheat following the Green Revolution, managing procurement and stocking grains that supported a vast Public Distribution System (PDS). Then move onto explain the role of FCI in the ongoing pandemic crisis.

Conclusion:

Conclude with strategies for the FCI(take hints from the article) which would enable it to more effectively play its role in countering the challenges posed by COVID-19.

Introduction:

Food Corporation of India (FCI) was formed in 1960's and was part of larger plan directed toward food security and self-sufficiency. Other major institution was CACP. These two institutions along with MSP regime and Public distribution system were expected to work in tandem. FCI's responsibility was to procure, Store and discharge grains as per policy of the government. Over the time, as in other cases these institutions too failed to adapt to changing circumstances such as changing demands of economy. As a result, FCI now reels under chronic inefficiency through huge wastages, and storage cost of grains keeps on cumulating.

Body:

the critical role being played by Food Corporation of India in countering the challenges posed by COVID-19:

- Notwithstanding its dubious reputation, the FCI has consistently maintained the PDS, a lifeline for vulnerable millions across the country.
- Currently, in the middle of the COVID-19 pandemic, FCI with its buffer stocks holds the key to warding off a looming crisis of hunger and starvation, especially in regions where lakhs of migrant workers have returned home with little money or food.
- The FCI has already moved 3 million tonnes (post-lockdown) to States, including Uttar Pradesh, Bihar, West Bengal and Karnataka and those in the Northeast, where demand outstrips State procurement and/or stocks.

- The FCI has also enabled purchases by States and non-governmental organisations directly from FCI depots, doing away with e-auctions typically conducted for the Open Market Sale Scheme (OMSS).
- Given the extended lockdown, the FCI is uniquely positioned to move grains across State borders where private sector players continue to face formidable challenges.

However, in recent times, there have been many concerns over FCI:

- FCI's operations are regarded as expensive and inefficient. There are long-term concerns regarding the costs of food subsidy.
- The FCI has witnessed mounting debts which currently stands at an estimated ₹55 lakh crore in March 2020, in the form of National Small Saving Funds Loan.
- FCI faces serious storage problems and is plagued by the issue of shortage of modern storage facilities. In the 1970s and 1980s, poor storage conditions meant a lot of grain was lost to pests, mainly rats.
- There have been reports of widespread diversion of grains and high leakage losses.
- FCI has lacked a "pro-active liquidation policy" for excess stocks which leads to market distortion in some instances. The distribution of subsidised grains is sometimes blamed for depressing food prices and affecting farmers.
- Some experts have argued that given the increasing role of the market economy, the FCI seems to have long outlived its purpose.

Measures that FCI can take during times of pandemic:

- **Use of Roads for transportation:**
 - The FCI has long back recognized the road movement as better suited for emergencies and for remote areas.
 - However, in 2019-2020 (until February) only 24% of the grains moved by road.
 - FCI needs to increase the use of roads more imperatively to move grains with least cost and efforts to the remote areas where the need is greatest
- **Decentralized storage:**
 - In the current context, it would be useful for the State government and the FCI to maintain stocks at block headquarters or panchayats in food insecure or remote areas.
- **Fiscal Burden:**
 - The centre should release stocks over and above existing allocations under PDS and Pradhan Mantri Garib Kalyan Yojana, but at its own expenses rather than by transferring the fiscal burden to States.
- **Activating Vibrant Network:**
 - In many States, there is a vibrant network of self-help groups formed under the National Rural Livelihoods Mission (NRLM) which can be tasked with last mile distribution of food aid other than the PDS.
 - Consultative committees presumably exist already in each State to coordinate with the FCI on such arrangements.

- **First in, First out (FIFO) principle:**
 - Typically, the FCI's guidelines follow a first in, first out principle (FIFO) that mandates that grain that has been procured earlier needs to be distributed first to ensure that older stocks are liquidated, both across years and even within a particular year.
 - It is time for the FCI to suspend this strategy, which will enable movement that costs least time, money and effort.
- **Farmer Producer Organisations (FPOs):**
 - The FCI along with the National Agricultural Cooperative Marketing Federation of India Ltd. (NAFED) has required expertise to manage the logistics to help farmers across the country to reach out to consumers directly.
 - The FCI should consider expanding its role to support FPOs and farmer groups, to move a wider range of commodities including agricultural inputs such as seeds and fertilizers, packing materials

Conclusion:

The Shanta Kumar Committee recommendations however were criticized due to suggestions like limiting NFSA, cash subsidy, privatization of FCI despite suggesting useful reforms to reform FCI, PDS. A closer scrutiny in the recommendation is needed today in times of agricultural distress & drought prone years. The FCI needs to **overhaul its operations and modernise its storage**.

Discuss the importance and role of MSMEs in the Indian Economy.(250 words)

Reference: [Indian Express](#)

Why this question:

The article brings out the fact that Medium, Small & Micro Enterprises have been the focus of the government's relief package and in what way they are worst hit, thus forcing us to ponder upon importance and role of MSMEs in the Indian Economy.

Key demand of the question:

Discuss in detail the importance and role of MSMEs in the Indian Economy.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define briefly MSMEs.

Body:

To start with explain the fact that MSMEs are worst hit. In India, capital is scarce and labour abundant. MSMEs are thought to have lower capital-output and capital-labour ratios than large-scale industries, and therefore, better serve growth and employment objectives. MSMEs are instruments of inclusive growth which touch upon the lives of the most vulnerable and marginalized. Explain the role of MSMEs in detail.

Conclusion:

Conclude with way forward.

Introduction:

Micro, Small & Medium enterprises (MSME) termed as “**engine of growth**” for India, has played a prominent role in the development of the country in terms of creating employment opportunities.

The government, in conjunction with the Reserve Bank of India (RBI), has now launched a series of measures to alleviate their distress.

Body:

Current crisis faced by MSME sector:

- The Covid-19 pandemic has left its impact on all sectors of the economy but nowhere is the hurt as much as the Medium, Small and Micro Enterprises (MSMEs) of India.
- All anecdotal evidence available, such as the hundreds of thousands of stranded migrant workers across the country, suggests that MSMEs have been the worst casualty of Covid-19 induced lockdown.
- MSMEs were already struggling — in terms of declining revenues and capacity utilisation — in the lead-up to the Covid-19 crisis.
- The total lockdown has raised a question mark on the existence of many primarily because these are not firms that have too much cash to wait out the crisis. That explains the job losses.
- According to a recent survey for “small and medium” firms in manufacturing, only 7% said they will be able to survive for more than three months with their cash in hand if their business remains closed.
- A big hurdle to restarting now is the lack of labour availability.

WHAT IT MEANS, HOW MANY, AND WHERE THEY STAND

CHART 1: DEFINITION OF MSME

| Classification | Manufacturing Enterprise* | Service Enterprise* |
|----------------|-----------------------------|--------------------------------|
| Micro | Up to Rs 25 lakh | Up to Rs 10 lakh |
| Small | Above Rs 25 lakh to Rs 5 cr | Above Rs 10 lakh to Rs 2 crore |
| Medium | Above Rs 5 cr to Rs 10 cr | Above Rs 2 cr to Rs 5 cr |

*Manufacturing Enterprise: investment in plant & machinery;
Service Enterprise: investment in equipment

CHART 2: ESTIMATED NUMBER OF MSMEs (IN LAKH)

| Activity category | Rural | Urban | Total | Share |
|-------------------|---------------|---------------|---------------|-------------|
| Manufacturing | 114.14 | 82.50 | 196.65 | 31% |
| Trade | 108.71 | 121.64 | 230.35 | 36% |
| Other services | 102.00 | 104.85 | 206.85 | 33% |
| Electricity* | 0.03 | 0.01 | 0.03 | — |
| All | 324.88 | 309.00 | 633.88 | 100% |

*Non-captive electricity generation and transmission

**CHART 3: ESTIMATED EMPLOYMENT IN MSME SECTOR (IN LAKH)**

| Broad activity category | Rural | Urban | Total | Share |
|-------------------------|---------------|---------------|----------------|-------------|
| Manufacturing | 186.56 | 173.86 | 360.41 | 32% |
| Trade | 160.64 | 226.54 | 387.18 | 35% |
| Other services | 150.53 | 211.69 | 362.22 | 33% |
| Electricity* | 0.06 | 0.02 | 0.07 | — |
| All | 497.78 | 612.10 | 1109.89 | 100% |

*Non-captive electricity generation and transmission

CHART 4: DISTRIBUTION OF ENTERPRISES CATEGORY-WISE (IN LAKH)

| Sector | Micro | Small | Medium | Total | Share |
|------------|---------------|-------------|-------------|---------------|-------------|
| Rural | 324.09 | 0.78 | 0.01 | 324.88 | 51% |
| Urban | 396.43 | 2.53 | 0.04 | 309.00 | 49% |
| All | 630.52 | 3.31 | 0.05 | 633.88 | 100% |

Potential of India's MSME sector:

- **Contribution to GDP:** The share of MSMEs in the country's gross value added is estimated to be about 32%.
- **Leveraging Exports:** It also contributes about 40% to total exports and 45% to manufacturing output.
- **Employment Opportunities:** It employs 60 million people, creates 1.3 million jobs every year and produces more than 8000 quality products for the Indian and international markets.
- **Diversity:** There are approximately 30 million MSME Units in India and is quite diverse in terms of its size, level of technology employed, range of products and services provided and target markets.
- **Fostering Inclusive Growth:** MSME is constructing inclusive growth in numerous ways through promoting non- agricultural livelihood at least cost, unbiased regional development, large female participation, and providing a protection against deflation.

The challenges and concerns associated with the growth of MSME sector:

- **Access to Credit:**
 - According to Economic Survey (2017-18), MSME sector faces a major problem in terms of getting adequate credit for expansion of business activities.
 - The Survey had pointed out that the MSME received only 17.4 per cent of the total credit outstanding.
 - Most banks are reluctant to lend to MSMEs because from the perspective of bankers, inexperience of these enterprises, poor financials, lack of collaterals and infrastructure.
 - According to a 2018 report by the International Finance Corporation, the formal banking system supplies less than one-third (or about Rs 11 lakh crore) of the credit MSME credit need that it can potentially fund

- most of the MSME funding comes from informal sources and this fact is crucial because it explains why the Reserve Bank of India's efforts to push more liquidity towards the MSMEs have had a limited impact.
- **Poor Infrastructure:**
 - With poor infrastructure, MSMEs' production capacity is very low while production cost is very high.
- **Access to modern Technology:**
 - The lack of technological know-how and financial constraints limits the access to modern technology and consequently the technological adoption remains low.
- **Access to markets:**
 - MSMEs have poor access to markets. Their advertisement and sales promotion are comparatively weaker than that of the multinational companies and other big companies.
 - The ineffective advertisement and poor marketing channels makes it difficult for them to compete with large companies.
- **Legal hurdles:**
 - Getting statutory clearances related to power, environment, labour are major hurdles.
 - Laws related to the all aspects of manufacturing and service concern are very complex and compliance with these laws are difficult.
- **Lack of skilled manpower:**
 - The training and development programs in respect of MSME'S development has been. Thus, there has been a constant crunch of skilled manpower in MSMEs

Other issues:

- Low ICT usage.
- Low market penetration.
- Quality assurance/certification.
- IPR related issues.
- Quality assurance/certification.
- Standardization of products and proper marketing channels to penetrate new markets.

Measures needed:

- Government of India and banks should design plans and measures to widen easy, hassle-free access to credit.
- The RBI should bring stringent norms for Non-Performing Assets (NPA) and it will help curbing loan defaulters and motivate potential good debts. Further, according to critics, the Credit Guarantee Scheme for MSME (CGTMSE) run by SIDBI is a growing contingent liability and needs to be examined with urgency
- Government should provide enhanced development and upgradation of existing rail & road network and other infrastructure facilities in less developed and rural areas to boost growth and development of MSMEs

- There should proper research and development in respect of innovative method of production and service rendering. Further, the government should promote and subsidise the technical know-how to Micro and small enterprises.
- Government should encourage procurement programme, credit and performance ratings and extensive marketing support to revive the growth of sick units.
- Skill development and imparting training to MSME workers is a crucial step to increase the productivity of the sector. The government should emphasise predominantly on skill development and training programs

Conclusion:

MSMEs being the growth engine of economy, there is a need to prepare a roadmap for sector in addition to the ad-hoc initiatives undertaken. Delineation of the objectives, vision, and mission is necessary to give clarity on the path to be treaded. An inclusive, sustainable vision to compete with the global MSMEs, by collaborating the industry groups, researchers, government and other stakeholders is the need of the hour.

In the age of globalization and FDI, what are the compelling reasons to think about Domestic Resource Mobilization? Discuss. (250 words)

Reference: Indian economy by Dutta and Sundaram

Why this question:

The question is from the static portions of GS paper I and based on the theme of mobilisation of resources.

Key demand of the question:

Explain the need and importance of domestic resource mobilisation in the days of globalisation and FDI.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Define what you understand by Domestic Resource Mobilization.

Body:

To start with explain that in low-income countries confronting widespread poverty, mobilizing domestic resources is particularly challenging, which has led developing countries to rely on foreign aid, foreign direct investment, export earnings and other external resources. Nevertheless, there are compelling reasons to give much more emphasis to DRM; vital to elevating economic growth, accelerating poverty reduction and underpinning sustained development, more congruent with domestic ownership than external resources etc.

Conclusion:

Conclude with importance of it in the contemporary world.

Introduction:

Mobilization of resources is all about how a government or governmental organization or a non-governmental organization can mobilize the material resources including finance to carry out its development projects or mission. For government, the mobilization of resources stands for collection of funds to allocate these resources to various development plans and schemes.

Body:

Importance of Domestic Resource Mobilization (DRM):

Telegram: <https://t.me/insightsIAStips>

Youtube: <https://www.youtube.com/channel/UCpocbcCX9GEIwaile4HLjwA>

Facebook: <https://www.facebook.com/insightsonindia>

In low-income countries confronting widespread poverty, mobilizing domestic resources is particularly challenging, which has led developing countries to rely on foreign aid, foreign direct investment, export earnings and other external resources. Nevertheless, there are compelling reasons to give much more emphasis to DRM.

- Greater reliance on DRM is vital to elevating economic growth, accelerating poverty reduction and underpinning sustained development.
- High-growth economies typically save 20-30 per cent or more of their income in order to finance public and private investment.
- DRM is potentially more congruent with domestic ownership than external resources.
- Foreign aid invariably carries restrictions and conditionality.
- FDI is primarily oriented to the commercial objectives of the investor, not the principal development priorities of the host country.
- DRM is more predictable and less volatile than aid, export earnings, or FDI.
- **Mobilization of resource is done through:**
- **Public sector:**
 - Public revenue generation for investment in social services and infrastructure.
- **Private sector:**
 - The private sector mobilizes the savings of households and firms through financial intermediaries, which allocate these resources to investment in productive activities.

Measures needed for DRM:

- **Broad-basing private investment** in infrastructure requires commitment and holistic efforts from both the Centre and the states.
- **Empower public institutions to drive transformation:**
 - Capable creditworthy public institutions are an essential prerequisite to attract private investment.
- **Rewire contracting frameworks:**
 - Expediting creation of a PPP think-tank institution as recommended by the Kelkar committee could help.
 - We should look beyond conventional build-operate-transfer models to annuity and investment-lite performance-contracting models.
 - This would require recalibrating risk-sharing, and reworking contracts with clear performance metrics.
- There is a pressing need for enhanced recapitalization of public sector banks (PSUs) and also divesting the ownership.
- The government must revise these specific schemes, designed to augment production for exports, to suit the changing global environment and ensure proper functioning.

- **Create supply-side enablers to deepen the infrastructure financing ecosystem:**
 - Stalled projects need to be dealt with steadfastly to attract private developers.
 - Building capacity to implement the Insolvency and Bankruptcy Code will be crucial.
 - Creating a diversified and resilient financing ecosystem to facilitate a shift from overreliance on bank-led financing.
 - **Strengthening bond markets** and expeditious deployment of capital under the National Investment and Infrastructure Fund can help.
- CRISIL said that the problem of stressed assets in the banking system to push the investment cycle.
- India would need to find innovative mechanisms to attract investments into infrastructure to sustain its growth.

Conclusion:

There is an urgent need to activate stalled projects and clean up balance sheets of corporate firms and the banking sector to revive the investment cycle. It is important to revive overall investment — especially in infrastructure — for balanced growth.

Do you think that that the Government's step to divert rice for the production of ethanol is a just decision while the poor are leaving hand to mouth in the country?

Analyse.(250 words)

Reference: [Indian Express](#)

Why this question:

The Union government had on Monday approved that surplus rice available with FCI can be used for converting into ethanol to manufacture alcohol-based hand sanitizers and also for blending with petrol. Thus the question.

Key demand of the question:

One has to debate over the fact that should India, a country with rampant poverty, hunger, and malnutrition, use food grains for making ethanol.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Present briefly the context of the question.

Body:

One can start deliberating on the fact and justify that diverting rice to produce ethanol during pandemic is unethical. Such diversion of food crops to produce biofuel was considered one of the reasons for the rise in food prices globally. Corn and other grain are also used in feedstock for poultry and cattle and is hence part of the food economy. It potentially deprives food to humans as well as livestock. At a time when there are fears of a steep fall in national income, a rise in unemployment, and an increase in food inflation due to supply bottlenecks, it is imperative that food security and food price stability be given the highest priority. Highlight the concerns point by point and discuss positives if any.

Conclusion:

Conclude with a fair and balanced answer.

Introduction:

Surplus rice available with the FCI is allowed to be converted to ethanol for utilization in making alcohol-based hand-sanitizers and for blending in petrol. Approval in this regard was recently given by the **National Biofuel Coordination Committee (NBCC)**. Ethanol produced from this will be used for utilization in making alcohol-based hand sanitizers and blending in petrol. Even sugar mills have simultaneously ramped up hand sanitizer manufacturing capacity to almost 100,000 liters per day to cater its rising demand following the coronavirus outbreak.

Body:

Ethanol, or ethyl alcohol, is a liquid that has several uses. **At 95% purity**, it is called **rectified spirit** and is used as **the intoxicating ingredient in alcoholic beverages**. At **99%-plus purity**, ethanol is used for **blending with petrol**. Both products are made from molasses, a byproduct of sugar manufacturing.

Rationale behind the move:

- The National Biofuel Coordination Committee (NBCC) took the decision which will lead to utilization of part of a **huge stockpile of 30.57 million tonnes (MT) of rice which is almost 128% more than the buffer stock and strategic requirement norms**.
- At present, the Food Corporation of India (FCI) has huge rice stock from previous years excluding the unmilled paddy lying with millers on behalf of FCI.
- Using surplus rice for ethanol will address the concern of about **750 million liters of grain-based distillery capacities lying idle**, due to the lack of feedstock.
- In India, the total capacity of grain-based distilleries is close to 2 billion liters, of which around 38% (750 million liters) was lying unused.
- The **National Policy on Biofuels, 2018** allows conversion of surplus quantities of food grains to ethanol when there is a projected oversupply of food grains.

Possible implications:

- In 2007-8, about 25 per cent of the corn produced in the US was used for biofuel production. In addition to cereals, oilseed crops like rapeseed, soyabean and sunflower were used for biofuel production. In 2018-19, an astounding 37.6 per cent of the corn produced in the US was used for making ethanol.
- Such diversion of food crops to produce biofuel was considered one of the reasons for the rise in food prices globally.
- Corn and other grain is also used in feedstock for poultry and cattle and is hence part of the food economy.
- India's position in the Global Hunger Index has slipped nine places. India was placed 102 among the 117 countries ranked in the index in 2019.
- The National Family Health Survey (NFHS-4) 2015-16, found that 38.4 per cent of children under five years are "stunted" (height for age), and 21 per cent are "wasted" (low weight for height). In fact, over a period of 10 years, wasting has increased from 19.8 per cent in NFHS-3 to 21 per cent in NFHS-4.

Concerns raised against the move:

- This move has been criticized on the grounds that how can the government waste food stock for fuel when the considerable number of the population doesn't have food and is suffering from malnutrition.

- On 26th March 2020, the government decided to give 5 kg wheat or rice and 1 kg of preferred pulses free of cost to 800 million people, under the National Food Security Act, 2013 (NFSA) in the wake of the Covid-19 pandemic.
- However, many poor people are unable to get the benefit out of it, due to loopholes in the PDS network.
- For example, a large chunk of ration card holders may not be eligible for the free grains, as they are not covered under the NFSA.
- The NFSA, based on the 2011 census, had not factored in the population increase in over nine years, leaving a huge number of people out of its ambit.
- About 85 per cent of rice is kharif crop, heavily dependent on monsoon. Despite the prediction of a normal monsoon, public interest demands that the basis for the projection of surplus of rice is disclosed. What happens if the monsoon projections go wrong? Will we have to import grain?

Way forward:

- Ethanol can be produced from other ingredients such as B and C heavy molasses, sugar, sugar syrup, and sugarcane juice.
- Ethanol has also been blessed with a low GST and enjoys relaxed conditions for inter-state movement if used for blending with petrol.
- Since the economy faces a bleak prospect due to the impact of COVID-19, the government should first use the food grains to meet the requirement of about 10 to 20 crore people without ration cards.
- It must provide rice to NGOs at PDS prices, for providing cooked food to migrant labour stuck in cities and it should provide an additional five kg food grains to the poor for six months instead of three months.
- If the Centre still thinks that the country will still have surplus rice, it must facilitate export to friendly countries which are suffering an adverse impact of COVID-19 on their economies.

The environmental values and the economic values often seem to be contradictory to each other. However, in the long term, only the integration of both the values can bring the well-being for the humankind. Elucidate.(250 words)

Why this question:

The question is premised on the fact that environmental values and the economic values must go hand in hand in order to achieve the well-being of humankind.

Key demand of the question:

Explain the importance and need for integration of environmental values and the economic values.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Economic expansion of human being has been seen as a challenge to the ecology and environment right from the ancient age.

Body:

Explain the given statement with suitable example. Debate between environment and economic value. need an integrated approach to human development by adopting means such as - Development of renewable energy, Development of environmental rule of law etc.

Conclusion:

Conclude with need for the integration of the two.

**Introduction:**

India has made a lot of progress in the last two decades, but we must sustain the growth engine to ensure increased incomes, improved livelihood and a better quality of life. Economic growth has positive impacts like increase in wealth/reduction in poverty, improved standards of living, health, education and infrastructure and technology. However, there are negative effects like health challenges, increase in income inequality, increased pollution and a depletion of natural resources

Body:**Development and Environment:**

- Development and environment are two sides of the same coin.
- On one hand people are concerned about the environment in which they live.
- Major issues like global warming, greenhouse effect, air and water pollution are increasing each day.
- On the other hand, to eradicate poverty and increase growth in the economy, development is mandatory.
- Without economic development a nation cannot come out of the vicious circle of poverty.
- As our population grows, finding a balance between economic advancement and consumption of natural resources is a vital question that India should address. Development without environment is meaningless.
- We need to save our resources for our future generations so that they can live in a healthy environment.

Some of the recent negative externalities on environment:

- Nearly 17,000 grown trees will be chopped off for redevelopment of central government accommodations in south Delhi.
- Trees have been felled regularly across the country to make way for concrete monstrosities.
- Between 2008 and 2017, nearly 20,000 thousand trees have been cut in Bengaluru to make way for flyovers, road widening and other projects.
- In Gurugram in 2016-17 alone close to 10,000 trees were cut.
- According to government data over the last 30 years, forests nearly two-thirds the size of Haryana have been lost to encroachments and industrial projects

Concerns posed:

- The current GDP estimates do not account for the gains/losses in natural capital.
- Identifying and quantifying the ecosystem services for the purpose of damage assessment is a difficult task in the absence of relevant data.
- Water scarcity, high levels of pollution, extreme weather phenomena and the regular occurrence of floods and droughts could strain an economy fighting to grow.
- Health challenges, increase in income inequality, increased pollution and a depletion of natural resources.
- Large economic growth adversely affects the environmental quality and economic welfare of individuals and households.
- Development policies give more priority to income and employment generation, implementation of pollution control policies is very poor.
- At present, the price of a commodity covers only the private cost of production, not the damage cost.

- This makes the commodity relatively cheaper leading to more demand and output, and more pollution and environmental damage cost.
- India has more environmental conflicts than any other country, according to Environmental Justice Atlas, an international database.
- Researchers have found that environmental governance in India is poor not because of laws but their pathetic implementation.
- Multiplicity of authorities for environmental management and poor coordination among them

Way forward:

Role of Enterprises:

- Production systems must become sustainable.
- Switching from non-renewable to renewable sources of energy and materials targeting cleaner production.
- Improving energy efficiency in industry is one of the most cost-effective measure.
- Maximising recycling and reuse of wastes.
- Industries across sectors must come together on a common platform to address the issues concerning economic development and environment protection.
- Market-based instruments such as pollution tax and tradable pollution permits must be carried out.

Role of Government:

- Policies need to be simplified to create an ecosystem for new sustainable businesses to flourish.
- ICT can help drive socio-economic achievements via e-health, e-government services and smart grids for utilities.
- Good environmental governance which limits exploitation of natural resources to sustainable levels.
- Our policy should not be based on the “pollute-first; clean-up-later” approach.
- We need to strengthen participatory processes such as public hearings in the environmental and forest clearance process.
- Developing and reporting measures of human well-being other than GDP that better account for environmental and social costs of resource use.
- The Green GDP is a step forward for India if it wishes to account for true economic growth and its holistic wealth.
- Strict environmental regulation may reduce environmental damage significantly.
- India should work with foreign governments and global organizations to find ways of subsidizing clean fuel and cleaning our rivers and aquifers.

Conclusion:

The transition to economic growth coupled with efficiency in natural resource use and its conservation can help India attain its goals of inclusive growth with sustainable development. The time has indeed come to add “swachh paani” and “hawa” to “roti-kapada-makaan-aur-bijli”, to begin our journey towards sustainable growth.

Discuss the issues involved in import dependent manufacturing industries, What needs to be done to ensure they tread the path of self-reliance in the country? (250 words)

Reference: [Indian Express](#)

Why this question:

The article talks about the issues facing the manufacturing industry in the country. It highlights the sectors dependent on imports and issues concerning them.

Key demand of the question:

Explain the issues involved in import dependent manufacturing industries, suggest solutions to address their concerns and elaborate on what needs to be done to tread the path of self-reliance.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain the current state of manufacturing sector in the country.

Body:

To start with, highlight the sectors that are import dependent. Talk about manufacturing sectors like – electrical and electronic industry, pharmaceutical industry etc. Discuss specific issues in these sectors – lack of flexibility in labour laws, high costs and low availability of land and high cost of electricity etc. Suggest solutions to address the problems.

Conclusion:

Conclude with way forward.

Introduction:

The Prime Minister recently brought up the importance of local manufacturing and consumption of locally produced goods, stating that Indians needed to become “vocal for local”. He hinted that the government would need to undertake major reforms in order for the Indian industry to play a major role in the global supply chain.

Body:

Sectors that heavily depend on imports right now and cannot immediately scale up production domestically:

- Electrical equipment such as smartphones and computers are a key part of India’s import bill.
- The value addition in India’s electronics industry is limited to mostly assembly, while the country depends on imports to access most of the primary and critical components used to make them, including printed circuit boards (PCBs).
- For instance, around 88 per cent of the components used by the mobile handsets industry are imported from countries like China, according to the Confederation of Indian Industry.
- Over 60 per cent of the country’s medical devices are imported as well.
- Other products heavily imported into the country are cells and modules used by the country’s solar power industry.

Sectors that partially depend on imports to make their finished products:

- India’s pharmaceutical industry is capable of making finished formulations, and also has domestic manufacturers of several key ingredients used to make them. However, the industry also imports some key ingredients for antibiotics and vitamins currently not manufactured in India.
- The country is currently trying to encourage domestic firms to make these key ingredients, known as fermentation-based APIs. However, this may take a few years.

- India imported around Rs 249 billion worth of key ingredients, including fermentation-based ingredients, in FY19, and this accounted for approximately 40 per cent of the overall domestic consumption, according to CII.
- Medical devices like ventilators also rely on imports of several crucial components like solenoid valves and pressure sensors.
- Some auto manufacturers depend on imports for various components, while the country's electric vehicles industry is dependent, "to a large extent" on Chinese imports for chemicals used to make cathodes and battery cells, it said.
- Local dyestuff units in India are also heavily dependent on imports of several raw materials, while specialty chemicals for textiles like denim are also imported, according to CII.
- For instance, when China initiated its lockdown of Wuhan earlier this year during the COVID-19 pandemic, nearly 20 per cent of India's dyes and dyestuff industry production was hit due to a disruption in raw material.

Issues with scaling up production in import dependent sectors:

- The manufacture of some of the key products that India imports such as semiconductors, displays and other very capital intensive electrical equipment may not be possible soon as manufacturing these requires large, stable sources of clean water and electricity.
- They also need a high degree of policy certainty as these require high upfront investments.
- Indian firms can however begin producing less sophisticated components if certain policy measures are taken
- The Indian industry faces much higher costs in inputs such as electricity and much higher logistics costs than Chinese firms.
- It costs Rs 4/kg for a shipment of cable to arrive at Mumbai from a city 300 km away from Shanghai but it costs around Rs 14/kg for that shipment to be transported from Mumbai to a factory in Noida.
- This is also true for fermentation based APIs, which Indian pharma executives claimed the country became less competitive in when China began receiving infrastructure and logistic support to produce and sell them at cheaper rates.

Policy measure does industry need for greater local production:

- A key issue holding back manufacturing in the country and a lack of flexibility in labour laws, high costs and low availability of land and high cost of electricity.
- Some states including UP and Madhya Pradesh have relaxed some labour laws with Karnataka likely to follow suit.
- It will be very important for the government to take initiatives and announce more relief packages.
- The government to provide cash infusions that allow companies to give workers jobs and buy raw materials.
- The government will also need to increase the insolvency limit for SMEs and MSMEs to 1 crore from 1 lakh.
- India's manufacturers could learn a lot from the IT sector's experience in promoting the large-scale development of s
- Continued focus on education will help attract foreign investment and also help the economy overcome the challenges.
- Favorable market access policies
- Investor's confidence must be improved.

- Improving physical infrastructure from transport systems to the power sector is essential.
- Enhancing the flexibility of labour regulations.
- FDI policy requires a review to ensure that it facilitates greater technology transfer, leverages strategic linkages and innovation.
- Attractive remuneration to motivate people to join the manufacturing sector

Conclusion:

Going forward, there is need for an industrial policy, an innovation policy and need to look at what the industries need in terms of making their infrastructure more efficient.

Inclusive growth and issues arising from it.

What are some of the practical ways by which countries can boost social inclusion as well as economic growth? Discuss in the context of India. (250 words)

Reference: Indian Economy- Uma Kapila.

Why this question:

The question is from the static portions of GS paper III.

Key demand of the question:

The answer expects elaboration on ways and means of social inclusion as well as economic growth.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Explain briefly what you understand by inclusive growth.

Body:

To start with explain that Inclusive growth means economic growth that creates employment opportunities and helps in reducing poverty. It means having access to essential services in health and education by the poor. It includes providing equality of opportunity, empowering people through education and skill development. Suggest methods by which countries can boost social inclusion as well as economic growth.

Conclusion:

Conclude with way forward.

Introduction:

Social inclusion is the process of improving the terms on which individuals and groups take part in society—improving the ability, opportunity, and dignity of those disadvantaged on the basis of their identity. Exclusion can rob individuals of dignity, security, and the opportunity to lead a better life.

Body:

Costs of social exclusion:

- **At the individual level**, the loss of wages, lifetime earnings, poor education, and employment outcomes are the commonest measures of costs. Social exclusion is often solidified through discrimination, which can have physical and mental health costs.
- **At the national level**, the economic cost of social exclusion can be captured by forgone gross domestic product (GDP) and human capital wealth. Exclusion or the perception of exclusion may

cause certain groups to opt out of markets, services, and spaces, with costs to both individuals and the economy.

- A recent International Monetary Fund (IMF) paper shows that the current gender gap in the labor force costs countries at the bottom half of gender inequality around 35 percent of GDP.
- A 2018 World Bank paper estimates that Africa alone lost \$ 2.5 trillion in human capital due to gender inequality and 11.4% of total wealth in 2014.
- Another study found that exclusion of the ethnic minority Roma cost Romania 887 million euros in lost productivity.

Steps taken by the government for Inclusive Growth:

The government has realized the importance of inclusive growth and has taken steps accordingly. Some of the steps taken by the government are:

- Sarva Shiksha Abhiyaan
- Right to Education
- Midday meal scheme
- MNREGA
- Housing for All
- Pradhan Mantri Gram Sadak Yojana
- Pradhan Mantri Jan Dhan Yojana
- National Social Assistance Programme
- National Health Mission
- Rashtriya Swasthya Suraksha Yojana
- Pradhan Mantri Jeevan Jyothi Bhima Yojana
- Skill India, Make in India and Digital India
- Right to Information
- Other initiatives like Payment Banks, Small Finance Banks.

When the social indicators of an individual and a society improves by social inclusion measures, it leads to improved economic growth as they start contributing in various ways. **World Economic Forum** has suggested **3 practical ways by which countries can boost social inclusion as well as economic growth:**

- First, countries should **increase public and private investment in their citizens' capabilities**, which is the most important way they can durably lift their rate of productivity growth.
- Second, governments, **together with employers' and workers' organizations, should upgrade national rules and institutions relating to work**. These influence the quantity and distribution of job opportunities and compensation, and thus the level of purchasing power and aggregate demand within the economy.
- Third, **countries should increase public and private investment in labor-intensive economic sectors** that generate wider benefits for society. These include sustainable water, energy, digital, and transport infrastructure, care sectors, the rural economy, and education and training.

Other ways:

- Research into the effects and causes of social exclusion.
- Educational and awareness campaigns on the needs of people who are socially excluded.
- To encourage service providers to adapt their services to meet their needs, or the public to generally be more accepting of, and engaging with, particular communities;

- regeneration activities to change and improve the social and economic circumstances of a community.
- providing a local network group, linking groups in an area concerned with different issues affecting a particular community to enable them to make a more effective and joined up approach.
- increasing or coordinating opportunities for particular communities to participate in society. For instance, decision making on certain aspects by local decision making groups like local governments.

Way forward for India:

- Indian government along with the state governments and local governments should continue to focus on eradicating poverty and achieving sustainable development in order to improve the lives of India's people.
- Through innovative partnerships with an international organization, civil societies, and private companies, inclusive and equitable growth can be targeted.
- Inclusive growth will help in the empowerment of vulnerable and marginalized populations, improve livelihoods, and augment skill-building for women.

Conclusion:

Inclusive growth is of vital importance to fight inequality in all aspects and promote holistic development of individuals in the country. Inclusive growth is necessary for the sustainable and holistic development of all sections of the society. For economic, social and political empowerment of its citizens, the core components of the Inclusive growth must be tackled.

“Economic growth is a precondition for inclusive growth”, Do you agree? Analyse.(250 words)

Reference: Indian Economy- Uma Kapila.

Why this question:

The question is from the static portions of GS paper III.

Key demand of the question:

Explain in detail in what way economic growth is a precondition for inclusive growth.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Present briefly the salient features of inclusive growth.

Body:

To start with explain the fact that the growth is inclusive growth when it is socially inclusive, regionally balanced, which enables every state to do better than in the past, which narrows the gap between different communities, which also brings in our concern for gender equality, upliftment of women, improving their educational condition and social status. Economic growth is a precondition for inclusive growth, though the nature and composition of growth has to be conducive to inclusion.

Conclusion:

Conclude with importance of it.

Introduction:

The concept of **inclusive growth focuses on equitable growth for all sections of society**. This involves ensuring that fruits of growth and development reach the poor and marginalized sections as

well. Inclusiveness is a multi-dimensional concept. Inequalities that include, social exclusion, discrimination, restrictions on migration, constraints on human development, lack of access to finance and insurance, corruption – are sources of inequality and limit the prospect for economic advancement among certain segments of the population, thereby perpetuating poverty

Body:

Economic growth is a precondition for inclusive growth, though the nature and composition of growth has to be conducive to inclusion.

- Inclusive growth is to include the poor and lagging socio-economic groups such as ethnic / tribal groups, weaker sections as well as lagging regions as partners and beneficiaries of economic growth.
- The Inclusive growth addresses the constraints of the excluded and the marginalised. It has to open up opportunities for them to be partners in growth.
- Inclusive growth should be non-discriminatory and favourable for the excluded. This implies that inclusive growth has to be broad-based in terms of coverage of regions, and labour-intensive in terms of creating large-scale productive employment opportunities in the economy.
- Inclusive growth is expected to reduce poverty faster in the sense that it has to have a higher elasticity of poverty reduction.
- Inclusive growth has to ensure access of people to basic infrastructure and basic services/capabilities such as basic health and education. This access should include not only the quantity, but also quality of these basic services.
- Inclusive growth should reduce vertical as well as horizontal inequalities in incomes and assets.

However, only economic growth does not automatically translate into widely shared gains. Policy choices matter: abject poverty has persisted despite rapid growth in several economies, while some poorer and slower-growing economies have been remarkably successful in alleviating extreme poverty and social deprivation. The relatively even distribution of income and wealth in several Asian “tiger” economies and, before them, in the Nordic countries, demonstrates that equality is associated with sustained strong economic performance. By contrast, high levels of inequality in other economies have coincided with volatile economic performance.

Way forward:

- Economic policies, particularly those aimed at fostering market integration, tend to impact on men and women differently, and development strategies should aim to promote gender and other forms of equality, in order not only to increase social welfare and facilitate the realization of human potential but also to improve the underlying performance of the economy.
- Policy makers will have to pay particular attention to the agricultural sector, public investments in the social sectors, and, most importantly, the employment content of growth in order to achieve inclusive development paths.
- In terms of social sector spending, public sector investments in education, training and health programmes allow countries to address different aspects of poverty and exclusion directly.
- Investments in social services can also boost aggregate demand that “crowds in” private investment.
- Cash transfers can support vulnerable groups, including single parents, children, older persons, and persons with disabilities or chronic illnesses, who may have few alternative sources of income.

- The most critical component of inclusive growth is the creation of decent jobs. Full, productive and decent employment is the most important source of income security and it paves the way for broader social and economic advancement, strengthening individuals, their families and communities.

Discuss some of the key elements of Inclusive Growth in India while highlighting the challenges associated with it.(250 words)

Reference: Indian Economy by Uma Kapila

Why this question:

The question is from the static portions of GS paper III.

Key demand of the question:

Students are expected to detail upon the key elements that constitute Inclusive growth and also bring out the challenges associated with it.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

First define what you understand by Inclusive growth.

Body:

To start with explain the significance of inclusive growth in short. Then move on to list the key elements that constitute it; Agriculture Development Industrial Development, Environment Protection, Poverty Reduction, Employment Generation etc. elaborate on each factor as to how they lead to inclusive growth. Discuss what are the challenges associated with it.

Conclusion:

Conclude with solutions and way ahead.

Introduction:

The concept of **inclusive growth focuses on equitable growth for all sections of society**. This involves ensuring that fruits of growth and development reach the poor and marginalized sections as well. Inclusiveness is a multi-dimensional concept. Inequalities that include, social exclusion, discrimination, restrictions on migration, constraints on human development, lack of access to finance and insurance, corruption – are sources of inequality and limit the prospect for economic advancement among certain segments of the population, thereby perpetuating poverty.

Body:

Challenges to inclusive growth:

- **Poverty alleviation** is one of the big challenges for India. Eradication of poverty in India is generally only considered to be a long-term goal. Poverty alleviation is expected to make better progress in the next 50 years than in the past, as a trickle-down effect of the growing middle class.
- **Increasing stress on education, reservation of seats in government jobs and the increasing empowerment of women and the economically weaker sections of society**, are also expected to contribute to the alleviation of poverty
- **Government schemes** should target eradication of both poverty and unemployment (which in recent decades has sent millions of poor and unskilled people into urban areas in search of

livelihoods) attempt to solve the problem, by providing financial assistance for setting up businesses, skill honing, setting up public sector enterprises, reservations in governments, etc.

- **Disparity**

- The disparity between -> Rich and Poor
- The disparity between -> Urban and Rural
- The disparity between -> Educated and Uneducated

- **Demography:** We have 550 million young people below 25 age, we have the ready workforce for the world, everything we do today must focus on this population, we need to provide them nutrition food, skills, and job opportunities to grow.
- **Improving the delivery of core public services:** The incomes rise, citizens are demanding better delivery of core public services such as water and power supply, education, policing, sanitation, roads and public health. As physical access to services improves, issues of quality have become more central.
- **Maintaining rapid growth while making growth more inclusive:** The growing disparities between urban and rural areas, prosperous and lagging states, skilled and low-skilled workers, the primary medium term policy challenge for India is not to raise growth from 8 to 10 percent but to sustain rapid growth while spreading its benefits more widely.
- **Developmental challenges:**
- **Expansion:** Expansion is happening every day in developing countries like India, but perhaps not happening in the pace we would like. We have roads but we need more roads likewise we need to expand energy, infrastructure, facilities, etc.
- **Excellence:** Leaving of our top 5 or 10% quality of our education, our services, our governance, is really not that so great, we must collectively work towards improving quality in everywhere.
- **Equity:** We need to make sure that the poorest to the poorer can indeed get the best education, health, jobs, and other facilities.
- **Social development** is possible through achieving Women Empowerment and eradicating the regional disparities. Though the Government is giving the women empowerment by giving special reservations, the women's advancement in India is still not matched the expectations for inclusive growth.

Measures needed:

- Lowering the incidence of poverty and inequality requires a comprehensive strategy.
- Important steps need to be taken like framing policies to improve health, nutrition and education.
- Labour market reforms and reforms of direct taxation will have redistributive effects on the system.
- Schemes like National Rural Employment Guarantee Scheme (NREGS), provide 100 days or more of employment at a wage determined by government are already in progress but there is a need to check the cost effectiveness of these schemes

- Reforms to plug the leakages in the PDS, introduction of GPS tracking, activating vigilance committees, must be undertaken across the country.
- Research needs to be carried out by government agencies to document the 'best practices' in the implementation of government schemes.
- Minorities and other excluded groups, including the poor in upper castes, also need special programmes to bring them into the mainstream.

Conclusion:

To achieve inclusiveness, all these dimensions need to be looked into. Institutional and attitudinal changes should be brought about though this will take time. Awareness about inclusiveness and empowerment is required to be created. Reducing poverty is to be taken as key element in our inclusive growth strategy and there has been some progress in that regard.

Government Budgeting. Investment models.

A mature PPP framework, along with a robust enabling ecosystem shall enable the Government to accomplish Nation building. comment.(250 words)

Reference: Indian Economy by Dutta and Sundaram

Why this question:

The question is from the static portions of GS paper IV.

Key demand of the question:

Explain the need for a mature PPP framework, along with a robust enabling ecosystem in accomplishing the goal of Nation building.

Directive:

Comment– here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

Introduction:

In short explain the importance of investment models in the nation building. PPP is an arrangement between government and private sector for the provision of public assets and/or public services. Public-private partnerships allow large-scale government projects, such as roads, bridges, or hospitals, to be completed with private funding

Body:

To start with explain what you understand by PPP. Explain the importance of it to the Indian economy. Explain that for a country to grow and increase its production investment is required. Private investment can be source from domestic or international market. Private investment can generate more efficiency by creating more competition, realization of economies of scale and greater flexibility than is available to the public sector. List down in detail the merits and demerits of PPP model.

Conclusion:

Conclude with need to embrace PPP model to accomplish the dream of Nation building.

Introduction:

Public Private Partnership means an arrangement between a government/statutory entity/government owned entity on one side and a private sector entity on the other. It is often done for the provision of public assets or public services, through investments being made and/or management being undertaken by the private sector entity, for a specified period of time. There is well defined allocation of risk between the private sector and the public entity. The private entity

who is chosen on the basis of open competitive bidding, receives performance linked payments that conform (or are benchmarked) to specified and pre-determined performance standards, measurable by the public entity or its representative.

Body:

Need for PPPs in nation building:

- Better infrastructure: It is a fact that most governments face the problem that public financing is not enough to bridge the gap between infrastructure need and available funds. In this respect, infrastructure development has to rely increasingly on private markets to leverage and mobilize capital.
- Risk sharing: The private sector is considered to be more proficient in resource acquisition and utilities deliverance than the government, and, therefore, it is further bolstering government's good fortune to impart the related risks to the private segment.
- Optimum allocation of resources: PPPs can help in the optimum allocation of public resources for the development of infrastructure. Though conventional models of public acquirement concentrate on accomplishing the most reduced forthright expenses in conveying infrastructural ventures infrastructural projects, PPPs concentrate on delivering cost-effectiveness over the duration.
- Innovations: Development is another imperative idea that the private segment can convey to public utilities. As a rule, people in the public sector may not be as inventive similar to the private area. The private division is constantly hunting down new items and utilities to expand its aggressive edge and to save costs.
- Aid in growth of other sectors: To the government, PPP frees up fiscal funds for other areas of public service and improves cash flow management as high upfront capital expenditure is replaced by periodic service payments and provides cost certainty in place of uncertain calls for asset maintenance and replacement.
- The catalyst for the economy: To the private sector participants, PPP provides access to public sector markets. If priced accurately and costs managed effectively, the projects can provide reasonable profits and investment returns on a long-term basis.
- More employment generation: Development of infrastructure will need manpower at various levels and hence it will generate more employment opportunities for the people.

- Improves the image of the country: There will be more development of better physical infrastructure and services through PPP and it will create a good impact on tourism and other enthusiast investors.
- Attract FDI: Scope for investment by the private sector in infrastructure will also provide the opportunities to foreign investors to participate and the financial crunch can be meted out easily. The better infrastructure is also a major boost to foreign direct investment (FDI).

Challenges faced by PPP in India

- Construction/implementation risk, arising from delay in project clearance; contractor default; environmental damage.
- Market risk, arising from insufficient demand; insufficient demand.
- Finance risk, arising from inflation; changes in interest rates; increase in taxes, Change in exchange rates.
- Operation and maintenance risk, arising from the termination of the contract; technology risk; labor risk.
- Legal risk, arising from changes in law; changes in title/lease rights; insolvency of developer/service provider; change in security structure.

Way Forward

- The success of Public-Private Partnership PPP to a large extent depends on optimal risk allocation among stakeholders, the environment of trust among stakeholders, robust institutional capacity to undertake grooming and implementation of PPP projects.
- Further to foster the successful implementation of a PPP project, a robust PPP enabling ecosystem including liquid and diversified financial institutions; sound regulatory and arbitration framework; mature developers and experienced consultants etc. is essential.
- To develop the PPP projects in India, the **Kelkar Committee** proposed some changes. Some of them are:
- The PPP model requires the involvement of a private partner to leverage financing and improve operational efficiencies. Therefore, state-owned enterprises or public sector undertakings should not be allowed to bid for PPP projects.
- PPPs should not be used by the government to evade its responsibility for service delivery to citizens. This model should be adopted only after checking its viability for a project, in terms of costs and risks.
- Further, PPP structures should not be adopted for very small projects, since the benefits are not commensurate with the costs.
- Risk allocation and management: Public-Private Partnership PPP contracts should ensure optimal risk allocation across all stakeholders by ensuring that it is allocated to the entity that is best suited to manage the risk. A generic risk monitoring and evaluation framework should be developed covering all aspects of a project's lifecycle.
- Strengthening policy and governance: The Prevention of Corruption Act, 1988 should be amended to distinguish between genuine errors in decision making and acts of corruption by public servants.
- Strengthening institutional capacity: A national-level institution should be set up to support institutional capacity building activities and encouraging private investments with regard to PPPs. Independent regulators must be set up in sectors that are going for PPPs.

- An Infrastructure PPP Project Review Committee may be set up to evaluate PPP projects. An Infrastructure PPP Adjudication Tribunal should also be constituted. A quick, efficient, and enforceable dispute resolution mechanism must be developed for PPP projects
- The government should notify guidelines for auditing of Public-Private Partnership PPPs, only enabling the review of government internal systems. Special Purpose Vehicles (private partners) should follow norms of corporate governance and financial disclosures as per the Companies Act, 2013.
- Strengthening contracts: The private sector must be protected against such loss of bargaining power. This could be ensured by amending the terms of the Public-Private Partnership PPP contracts to allow for renegotiations.
- PPP must not be a short cut only to save money or bridge fiscal gaps or transfer risks; it should be used to improve service quality or bring efficiency improvements.

Highlight the importance of rebuilding the village economy in the current times while throwing light on the relevance of gram Swaraj .(250 words)

Reference: [Hindustan Times](#)

Why this question:

The author brings out the dire need of ensuring the safety and the well-being of the poor and marginalized living in urban agglomerations in the current conditions.

Key demand of the question:

Explain the importance of rebuilding the village economy in the current times while throwing light on the relevance of gram Swaraj.

Structure of the answer:

Introduction:

Start by explaining the importance of village economies in general for the economic health of the nation.

Body:

Discuss the current situation; explain how large employment centers such as Mumbai, Delhi and Ahmedabad are struggling to contain the spread of the deadly virus. Discuss the issue of poor and migrants. Then discuss the concept of Gram Swaraj of Mahatma Gandhi and explain the applications of it in the current situation. His pioneering idea of Swaraj or self-rule emanated from the very foundation of the Indian society, its villages, and implied self-reliance. Gandhi envisioned his ideal village as a self-sufficient republic – independent of its neighbors for its own wants, and, yet, interdependent for those dependent on it.

Conclusion:

Conclude with importance.

Introduction:

The onset of the coronavirus pandemic has wreaked havoc across the world. India, apart from the pandemic faces another massive challenge of ensuring the safety and the well-being of its poor and marginalised living in urban agglomerations. Nearly one-fifth of India's labour force – about 100 million – are migrants. Rebuilding the village economy can enable people to stay in their communities.

Body:

Current scenario of migrants in the urban agglomerations of India:

- National Sample Survey Organisation, 2010 reported that about 30% migrants were working as casual workers and only 35% of migrant workers were employed as regular/salaried workers.

- Without having adequate social protection and safety measures, biased policies discounting the demands of millions of migrant workers working in various hazardous industries and mines, lack of basic minimum facilities, illiteracy compounded with social discrimination and on top of it, the recent COVID-19 pandemic have pushed these migrant workers to the margin.
- Large employment centers such as Mumbai, Delhi and Ahmedabad are struggling to contain the spread of the deadly virus.
- The problem gets further complicated for those who live in congested slums and ghettos where social distancing is at best a misnomer.
- Add to that, the poor and migrants are unemployed, and, in the immediate future, face an uncertain future.
- The post-lockdown images of migrant labourers walking back on feet or thronging bus and train stations caused a massive furore.
- Migrants are aware that, without work, they can't survive in cities.
- If they don't have work in their destination cities, they have no good reasons to stay away from the family.
- Most of them are employed in low-end, low-value, hazardous work, which is further compounded by a lack of identity and legal protection. For them, villages are still a better option, with a social security net.

The importance of rebuilding the village economy:

- Gram Swaraj – Gandhiji's talisman, the fruit of his life-long search for answers of India's many ills.
- His pioneering idea of Swaraj or self-rule emanated from the very foundation of the Indian society, its villages, and implied self-reliance.
- Gandhi envisioned his ideal village as a self-sufficient republic – independent of its neighbours for its own wants, and, yet, interdependent for those dependent on it.
- Migrants are aware that, without work, they can't survive in cities. In contrast, in their villages, they have a well-established food supply and free shelter.
- For migrants, in the current scenario, villages are still a better option, with a social security net.
- Rebuilding the village economy can enable people to stay in their communities.
- Livestock, fisheries, dairy, vegetables, fruit and food processing are more labour-intensive and high value-yielding.
- Small scale industries, local mills, cottage and home-grown products can make this happen if supported with an efficient distribution system and conducive laws.

Challenges faced by villages:

- There are only a few opportunities for them in villages, which prompted them to move out of the village in the first place, often leaving behind their families, to brave the harsh conditions of cities.
- They do this to make a life for themselves and support their families.
- Cities cannot do without them, and yet, their plight remains understated.

Measures undertaken so far to revive the village economy:

- To reopen the closed and defunct mills, especially those in the food business – the flour, oil and pulse mills.
- It's reviving small units such as dairies, and ensuring them security and support to employ the local workforce, and eventually, cater to foreign markets.

- The government is also trying to revive the micro, small and medium enterprises (MSME) sector, which has over 70 lakh units in the state – the largest share in the country.
- On Panchayati Raj Diwas (April 24th), the Prime Minister of India launched ‘Swamitva Yojana’ or Ownership Scheme to map residential land ownership in the rural sector using modern technology like the use of drones. The scheme aims to revolutionise property record maintenance in India.

Way forward:

- The state can effectively engage the self-help group (SHG) members by leveraging the collateral free credit of Rs 20 lakh extended to them as part of the Pradhan Mantri Garib Kalyan Yojana (PMGKY).
- There is a need to adopt a holistic approach and develop short- and long-term plans for migrants.
- After many decades of neglect in research and development, lack of market access, on-off policies for exports, and market distortions, the present adversity may be a timely opportunity for agricultural and allied sector.
- In line with the government of Uttar Pradesh, it can instruct the SHGs to concentrate on producing items/commodities that have local demand; **one-district-one-product model** could be followed.
- Using the locally available raw material, supply chain disruption can be addressed and demand creation can be planned for rural areas.
- Government should facilitate the credit linkage to these SHGs and agencies, including the Farmer Producer Organisations and Panchayats can be engaged in procuring these products with a minimum assured price and facilitating appropriate market linkages.
- Demand for additional 100 days of rural employment guarantee can also help the rural economy significantly.
- Large-scale plantation, horticulture, fishery-related activities can be taken up including regular activities under MGNREGS to create demand for jobs in rural areas.
- The government should also facilitate assured credit support to small rural enterprises.
- It can procure horticulture products from the doorstep of the farmers for a smooth supply chain after imparting required training to the migrant workers.
- As we embrace the knowledge era and focus on capacity building of rural youth, the opportunities in rural areas should, in principle, become higher than those in urban areas since the rural segment can now benefit from all three (agriculture, manufacturing and services) sectors of the economy.
- In the knowledge era, with **emphasis on capability and capacity building of rural youth** in terms of holistic education, appropriate technology and enhanced livelihood, there is a possibility for a more balanced distribution of income as well as population.
- This would need knowledge bridges to be built between cities and villages, and the creation of an ecosystem which has been conceptualised as a “**cillage**” — a synergistic combination of city and village.

Conclusion:

Rural economy would need support of a suitable policy framework and reforms in pricing policy, tax, market access, credit and rural infrastructure, like warehouses and cold storage. The next two years or so of how we learn to live with coronavirus can redesign the economy towards safer and more

sustainable production and consumption, with agriculture and the rural economy as its strength, rather than its weakness.

Major crops cropping patterns in various parts of the country, different types of irrigation and irrigation systems storage, transport and marketing of agricultural produce and issues and related constraints; e-technology in the aid of farmers Elaborate upon the prospects of transforming rural India with the help of digital technologies.(250 words)

Reference: weforum.org

Why this question:

The question is from the static portions of GS paper III.

Key demand of the question:

Explain the prospects of transforming rural India with the help of digital technologies in detail.

Directive:

Elaborate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Start by highlighting the fact that ICT is becoming the facilitator of socio-economic development in rural India with its obvious facilities by way of health, education, financial services and employment avenues, etc.

Body:

Explain what prospects digital technologies hold in general for India and direct the discussion to focus on its contributions to the rural India in particular. Explain how it can help the bridge gaps by providing 'e' and 'm' services. Discuss various offerings that ICT makes to the rural India – With respect to empowerment, enablement, market expansion etc. Comment on the Government steps to provide e-aid to farmers.

Conclusion:

Conclude with way forward.

Introduction:

Digital technologies can be interpreted broadly as “technologies that facilitate communication and the processing and transmission of information by electronic means.” It promises a fundamental change in all aspects of our lives, including knowledge dissemination, social interaction, economic and business practices, political engagement, media, education, health, leisure and entertainment. **The Fourth Industrial Revolution (4IR)** heralds an exponential pace of technological change, building on the digital revolution to combine technologies, spawn new ones, and transform systems, industries, countries – even society itself.

Body:

Evolving Internet in India:

- Commercial Internet services in India were launched in August 1995.
- The initial launch of Internet in 1995 was with dial-up access speeds of upto 9.6 kbps.
- The initial launch of Internet services was with a rate of Rs25, 000 for a 250-hour TCP/IP (Transmission Control Protocol/Internet Protocol) account applicable for commercial organizations (amounting to Rs100 per hour).

- The number of Internet users in India was expected to reach 450-465 million by June, according to the Internet and Mobile Association of India (IAMAI) and market researcher IMRB.
- Around 72% of Internet users in India are less than 35 years of age,
- 80% of all web traffic in India emanates from the mobile—second highest in the world, after Nigeria.
- Total number of telephone subscribers were 1,210.84 million as of 17 June, according to TRAI.
- Wireless accounted for 1,186.84 million subscriptions.
- Broadband subscribers stood at 301 million at the end of June, according to TRAI.

Digital technologies have emerged as a potent tool that can lead to socio- economic empowerment of Rural India:

ICT and agriculture:

The vast majority of poor people lives in rural areas and derives their livelihoods directly or indirectly from agriculture. Increasing the efficiency, productivity and sustainability of small-scale farms are an area where ICT can make a significant contribution. Farming involves risks and uncertainties, with farmers facing many threats from poor soils, drought, erosion and pests. ICTs can deliver useful information to farmers about agriculture like crop care and animal husbandry, fertilizer and feedstock inputs, pest control, seed sourcing and market prices

▪ **Digital technologies and agriculture:**

- The vast majority of poor people lives in rural areas and derives their livelihoods directly or indirectly from agriculture.
- Increasing the efficiency, productivity and sustainability of small-scale farms is an area where Digital technologies can make a significant contribution. Farming involves risks and uncertainties, with farmers facing many threats from poor soils, drought, erosion and
- Digital technologies can deliver useful information to farmers about agriculture like crop care and animal husbandry, fertilizer and feedstock inputs, pest control, seed sourcing and market prices.
- In April 2016, Modi launched eNAM (National Agriculture Market), an online platform for farmers that integrates agricultural markets online, allowing farmers and traders alike to view all Agriculture Produce Market Committee-related information and services, commodity arrivals and prices, and buy and sell trade offers, thus helping farmers bid for the best prices across markets. GOI also launched a crop insurance scheme, the Pradhan Mantri Fasal Bima Yojana (PMFBY) in 2016, which now covers 37 million farmers.
- Additionally, GOI is investing in mapping all of India's aquifers, and using technology to manage water demand. Quantifying the relationship between rainfall and groundwater levels under alternative modes of irrigation and farming should enable prioritization of prospective water and irrigation investments.

- Digitized land registration, mobile phones and 'Uberised' tractor services all are contributing to improved farm management. Digital India Land Records Modernisation Programme (DILRMP) is updating millions of land records, providing title guarantees and increased security of land tenure to farmers while stimulating land rentals by nonviable smallholders and land consolidation.
- **Digital technologies for Education:**
 - Moreover, appropriate use of Digital technologies in the classroom fosters critical, integrative and contextual teaching and learning; develops information literacy (the ability to locate, evaluate and use information).
 - Thus, it improves the overall efficiency of the delivery of education in schools and educational management institutions at the national, state/provincial and community level.
 - The use of Digital technologies in education aims to improve the quality of teaching and learning as well as democratize the access to education.
- **Digital technologies for Economic Development:**
 - Information and Communication Technology has a vital role in connecting the rural community to outside world for exchange of information, a basic necessity for economic development.
 - Effective use of ICT can demolish geographical boundaries and can bring rural communities closer to global economic systems and be of meaningful help to the underprivileged.
 - the Mahatma Gandhi National Rural Employment Guarantee Scheme, (MGNREGS), the largest in the world, guarantees up to 100 days of rural employment for those in need of employment at Rs100 (US\$1.5)/day. Using DBTs to pay beneficiaries has reduced transfer costs, waste and corruption – and sidestepping any possible misallocation of funds transferred from central to state to district to panchayats for distribution.
- **Employment Opportunities:**
 - Poor people in rural localities have lack of opportunities for employment because they often do not have access to information about them.
 - One use of ICTs is to provide on-line services for job placement through electronic labour exchanges in public employment service or other placement agencies
- **Digital technologies in e-Governance:**
 - The poverty can be adequately addressed by effective use of e-governance and ICT application in environmental management. Improved governance by using ICT can have direct impact in reducing poverty and improving the environment.
 - ICT can contribute in a large way in making government processes more efficient and transparent by encouraging communication and information sharing among rural and marginalized people.
- **Digital technologies in Capacity-building and empowerment:**

- Communities and farmer organisations can be helped through the use of ICTs to strengthen their own capacities and better represent their constituencies when negotiating input and output prices, land claims, resource rights and infrastructure
 - ICT enables rural communities to interact with other stakeholders, thus reducing social isolation.
 - It widens the perspective of local communities in terms of national or global developments, opens up new business opportunities and allows easier contact with friends and relatives. A role is also played by ICT in making processes more efficient and transparent.
 - It helps in making laws and land titles more accessible. Global Positioning Systems (GPS) linked to Geographical Information Systems (GIS), digital cameras and internet, help rural communities to document and communicate their situation.
 - Rural communities benefit from better access to credit and rural banking facilities.
 - Recent mobile banking initiatives offer further scope to reduce costs and stimulate local
 - The Indian AMUL programme automates milk collection and payments for its 500,000 members, thereby enhancing transparency of the milk volume and quality collected and ensuring fair payments to farmers.
- **Digital technologies and Service delivery mechanisms:**
- There is a huge gap between information residing in agricultural knowledge centres and rural communities.
 - At local level, multi-stakeholder mechanisms are important to make relevant information accessible to end users. Intermediary organizations have to connect rural communities to available Users will increasingly want tailor-made, quality answers to their questions.
 - In the Agricultural Clinics in India customers get answers within one to two days.
 - Mobile Q&A services are being piloted in India.
 - At national level, mechanisms need to be in place to ensure learning and information sharing.
 - PDS using new technologies. There is now far less pilfering thanks to the digitisation of 230 million ration cards, 56% of which are strengthened with a universal ID and Aadhaar. Several states have now installed electronic point-of-sale devices at FPSs to track sales of food grains to cardholders on a real-time basis. A much debated policy shift – in-kind cash transfers in place of food distribution – is also being facilitated by digital technology.
- **Digital technologies and Health:**
- Health care is one of the most promising areas for poverty alleviation.
 - Digital technologies are being used in India to facilitate remote consultation, diagnosis and treatment.

- Delivering health care with Digital technologies enables health care professionals and institutions to address the critical medical needs of rural communities, especially those in remote locations and those that lack qualified medical personnel and services.
- **Role of Digital technologies under climate change:**
 - Digital technologies can enable access to the set of resources in the event of climate change related shocks or disturbances.
 - Digital technologies provide access to relevant data and information that is first processed at an individual level, then facilitate communication and interaction between a wide range of stakeholders, and ultimately enable cooperation, which can translate into adaptive actions being implemented with the participation of a wide range of stakeholders.
 - ICTs can also speed up access to information.
 - This is particularly important when an acute climate related shock such as landslide or flood
 - Mobile based telecommunications networks allow rapid communication of information, thus improving the speed of disaster warning, response and recovery

Conclusion:

The use of Digital technologies tools help in strengthening social networks, empowerment and participation, as well as fostering productive processes at the local level through the provision of employment and skills, as well as support services for micro-enterprise activities. In rural communities of developing countries, with limited capacities and resources to respond to the effects of extreme natural hazards, drought, landslides, floods, and to the impacts of these events on local social systems (e.g. health, infrastructure, transportation, migration), Digital technologies tools (the potential of telecentres for disaster preparedness and response) are emerging as an area of increasing interest.

**Why it is important to integrate National and International agricultural markets?
Examine and also discuss the purpose of APMC Act and related Issues.(250 words)**

Reference: arthapedia.in

Why this question:

The question is from the static portions of GS paper III. It focuses on importance of integrating National and International agricultural markets, examine also the Purpose of APMC Act and the related Issues.

Key demand of the question:

Explain the importance of integrating National and International agricultural, markets, also examine the purpose of APMC Act and related Issues.

Directive:

Examine – When asked to ‘Examine’, we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Present in short the importance of agri markets in the rural regions of India.

Body:

To start with explain the purpose of APMC act, discuss the shortcomings of APMC in the past, and explain the model of APMC. Comment on the importance of integrating National and International agricultural markets. List out the concerns and challenges.

Conclusion:

Conclude with way forward.

Introduction:

Agricultural Produce Market Committee (APMC) is a statutory market committee constituted by a State Government in respect of trade in certain notified agricultural or horticultural or livestock products, under the Agricultural Produce Market Committee Act issued by that state government. There are about 2477 principal regulated markets based on geography (the APMCs) and 4843 sub-market yards regulated by the respective APMCs in India. The typical amenities available in or around the APMCs are: auction halls, weigh bridges, godowns, shops for retailers, canteens, roads, lights, drinking water, police station, post-office, bore-wells, warehouse, farmers' amenity center, tanks, Water Treatment plant, soil-testing Laboratory, toilet blocks, etc.

Following the Centre's directive to States to amend their Agricultural Produce Markets (APMC) Acts, the Gujarat government has promulgated an Ordinance expanding the purview of the Act to include livestock under agricultural produce and to provide better market access to farmers.

Body:

APMCs are intended to be responsible for:

- ensuring transparency in pricing system and transactions taking place in market area;
- providing market-led extension services to farmers;
- ensuring payment for agricultural produce sold by farmers on the same day;
- promoting agricultural processing including activities for value addition in agricultural produce;
- Publicizing data on arrivals and rates of agricultural produce brought into the market area for sale; and
- Setup and promote public private partnership in the management of agricultural markets

Issues posed by APMCs:

- **Monopoly of APMC:** Monopoly of any trade (barring few exceptions) is bad, whether it is by some MNC corporation by government or by any APMC. It deprives farmers from better customers, and consumers from original suppliers.
- **Cartelization:** It is quite often seen that agents in an APMC get together to form a cartel and deliberately restraint from higher bidding. Produce is procured at manipulatively discovered price and sold at higher price. Spoils are then shared by participants, leaving farmers in lurch.
- **Entry Barriers:** License fee in these markets are highly prohibitive. In many markets farmers were not allowed to operate. Further, over and above license fee, rent/value for shops is quite high which keeps away competition. At most places only a group of village/urban elite operates in APMC.
- **Conflict of Interest:** APMC play dual role of regulator and Market. Consequently, its role as regulator is undermined by vested interest in lucrative trade. They despite of inefficiency won't let go any control. Generally, member and chairman are nominated/elected out of the agents operating in that market.
- **High commission, taxes and levies:** Farmers have to pay commission, marketing fee, APMC cess which pushes up costs. Apart from this many states impose Value Added Tax.

- **Other Manipulations:** Agents have tendency to block a part of payment for unexplained or fictitious reasons. Farmer is sometimes refused payment slip (which acknowledges sale and payment) which is essential for him to get loan.

Taking these concerns into cognizance, Central Government appointed a working group which recommended a **Model APMC act**. However, the **model legislation** has actually given rise to a **conflict of interest**, as the APMC, which is a major player, is also the regulator/registering authority. There is reluctance on part of state governments to reform the APMC legislation, as it generates huge revenues. Some states have created entry barriers by prescribing either prohibitive license fees for setting up such markets, or the minimum distance between private markets and APMC markets. **Union Budgets of 2014-15 and 2015-16** had suggested the **creation of a National Agricultural Market (NAM)** following which **e-NAM** was launched on 14th April 2016 as a **Pan-India electronic trade portal to link APMCs across the States**.

Importance of integrating National and International agricultural markets

- The agricultural sector in India is progressively opening up to external trade, leading to interdependency between commodity prices across diverse markets.
- The country's food production has increased tremendously from just 51 million tonnes in 1950-51 to about 252 million tonnes in 2014-15. However, farm income did not grow much. This was also highlighted by the National Commission on Farmers (NCF) headed by MS Swaminathan.
- Recent incidents of farmers reportedly dumping their bumper produce of tomatoes and onions and emptying cans of milk into drains is evidence of it. Had the markets been integrated, the surplus produce would have been transferred to deficit regions.
- The seasonal spike in prices of perishable commodities that pushes up the food inflation cannot be addressed without market reforms.
- Production and marketing should march together in order to benefit farmers and consumers. Farmers need to be empowered to decide when, where, to whom and at what price to sell.
- Indian agricultural prices are not co-integrated with global agricultural prices in short run.
- Existing literature shows that our markets are not efficient, and thus they cannot respond to sudden shocks.
- Degree of openness data suggests that Indian agriculture sector has started opening up, but this is not visible in market integration for agricultural commodities.
- The correlation between global and domestic prices of agricultural commodities and changes therein depend upon many factors in accordance with the demand and supply conditions.

Way forward:

The measures needed in the Agricultural Marketing in India are

- It is imperative to bring agriculture marketing into the Concurrent or Union list to benefit farmers. This will guarantee remunerative prices to farmers.
- The Committee on Doubling Farmers' Income under the chairmanship of Ashok Dalwai justifies the recommendation saying marketing has no boundaries; this **necessitates a pan-India operation** to meet the demand across the country.
- NITI Aayog's **model Agricultural Produce and Livestock Marketing Act** should be implemented by the states. Further the provisions like facilitating single-point levy of taxes, promoting direct interface between farmers and end-users, and give freedom to farmers to sell their produce to whomsoever and wherever they get better prices.

- e-NAM is a good step in this way. Budget 2018 announced developed **GRAMS** which would be integrated to the e-NAM Structure.
- Promoting warehouse receipts, agro-processing and exports. Warehouse receipts will help farmers defer their sale immediately post harvest, when prices are at their lowest level.
- This will require a consolidation of farm produce, which can be successfully done through farmer-producer organisations.
- Agro-processing and trade will require investment in developing infrastructure.
- Existing agri-export zones need to be revisited and strengthened in this changing scenario.
- States alone cannot revamp the agricultural marketing sector, primarily due to paucity of funds and technology.
- Private investment on a massive scale needs to be invited to upgrade and build large storage and warehousing systems that are climate resilient.

Conclusion:

It is time to concede that **production and marketing** should march together in order to benefit farmers and consumers. Farmers need to be empowered to decide when, where, to whom and at what price to sell.

Elaborate on the key determinants of cropping pattern in India while presenting a spatial analysis.(250 words)

Reference: Indian Geography by Majid Hussain

Why this question:

The question is straightforward and is from the static portions of GS paper III.

Key demand of the question:

Explain key determinants of cropping pattern in India while presenting a spatial analysis.

Directive:

Elaborate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly define what you understand by cropping pattern.

Body:

To start with, explain that the cropping patterns may be affected by several factors and interplay of these factors. Some of these include physical and technical factors, economic factors, government agrarian policy, improvements in technology, availability of agricultural inputs and facilities etc. Discuss the physical factors affecting cropping pattern, technical factors and input availability affecting cropping pattern, Economic Factors etc. Draw a map of India and present the spatial aspects of the pattern.

Conclusion:

Conclude with suggestions to address the issues.

Introduction:

Cropping pattern is a dynamic concept because it changes over space and time. It can be defined as the proportion of area under various crops at a point of time. In other words, it is a yearly sequence and spatial arrangement of sowing and fallow on a given area. In India, the cropping pattern determined by rainfall, climate, temperature, soil type and technology.

Body:

**Some of the most commonly followed crop patterns:**

- **Rice-Wheat:** UP, Punjab, Haryana, Bihar, West Bengal, Madhya Pradesh.
- **Rice-Rice:** Irrigated and Humid coastal system of Orissa, Tamil Nadu, Andhra Pradesh, Karnataka and Kerala.
- **Rice- Groundnut:** Tamil Nadu, Andhra Pradesh, Karnataka, Orissa and Maharashtra
- **Rice-Pulses:** Chhattisgarh, Orissa and Bihar.
- **Maize-Wheat:** UP, Rajasthan, MP and Bihar.
- **Sugarcane-Wheat:** UP, Punjab and Haryana accounts for 68% of the area under sugarcane. The other states which cover the crops are; Karnataka and MP.
- **Cotton-Wheat:** Punjab, Haryana, West UP, Andhra Pradesh, Karnataka, Tamil Nadu.
- **Soya bean-Wheat:** Maharashtra, MP and Rajasthan
- **Legume Based Cropping Systems (Pulses-Oilseeds):** MP, Gujarat, Maharashtra, Andhra Pradesh and Karnataka.

The key determinants of cropping pattern in India are: Cropping pattern of any region depends upon many factors

- **Physical and Technical Factors:**

- These include the physical characteristic as soil, climate, weather rainfall etc. In the dry regions where the rainfall is scanty and where there is high uncertainty of monsoons, the dependence is on jowar and bajra. Water logging areas cultivate rice.
- Cropping pattern also depend upon irrigation facilities. Where ever water is available, not only can a different crop be grown but even double or triple cropping will be possible.

- **Economic Factors:**

- Economic motivation is the most important in determining the cropping pattern of the country. Among the various economic factors affecting crop pattern, the following are important:
- **Price and Income Maximization:** Price variations exert an important influence on acreage shifts. The variation in the inter-crop prices led to shifts in acreage as between the crops.
- **Farm Size:** There is a relationship between the farm size and the cropping pattern. The small farmers are first interested in producing food grain for their requirements. Small holder therefore devotes relatively small acreage to cash crops than large holders.
- **Insurance against risk:** The need to minimize the risk of crop failures not only explains diversification but also some specific features of crop patterns.
- **Availability of Inputs:** Seeds, fertilizers, water storage, marketing, transport etc. also affect the cropping pattern.
- **Tenure:** Under the crop sharing system, the landlord has a dominant voice in the choice of the cropping pattern and this helps in the adoption of income maximizing crop adjustments.

- **Infrastructure facilities:**

- Irrigation, transport, storage, trade and marketing, post-harvest handling and processing etc

- **Government Policies:**

- The legislative and administrative policies of the government may also affect the cropping pattern. Food Crops Acts, Land Use Acts, intensive schemes for paddy, for cotton and oilseeds, subsidies affect the cropping pattern.
- MSP – farmers shifting to wheat, rice
- Green Revolution – skewed cropping pattern in Northern India towards wheat and rice from coarse cereals and pulses

- **Social factors**

- Food habits also play a role – East and South India prefers rice as staple food while it is wheat in North India.

Conclusion:

The cropping pattern in India has undergone significant changes over time. As the cultivated area remains more or less constant, the increased demand for food because of increase in population and urbanisation puts agricultural land under stress resulting in crop intensification and substitution of food crops with commercial crops

How does transportation affect agriculture? What are the problems associated with it? Elucidate. (250 words)

Reference: Indian Geography by Majid Hussain

Why this question:

The question is straightforward and is from the static portions of GS paper III.

Key demand of the question:

The question aims to analyse the important role played by transportation in the agriculture sector and the issues associated with it.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly quote the significance of transport in the agri sector in general.

Body:

When analyzing transport of agriculture produce, it is identified that transport costs has critical role in recognizing the link between accessibility and agricultural development. Good transport system is critically important to competent agricultural marketing. For distribution of agriculture produce, road transport has vital role because it is the major means of transporting agricultural produce from the farms to the markets as well as to various urban communities. It is the only means by which food produced at farm location is transported to different homes as well as markets. Transport creates market for agricultural produce, improves interaction among geographical and economic regions and opens up new areas to economic focus. Explain the associated concerns or challenges. Suggest what needs to be done to overcome it.

Conclusion:

Conclude with way forward.

Introduction:

The story of an adequate farm management begins and ends with efficient and properly managed transport. Transport takes a very important place in every industry, including agriculture. In order to produce food, farmers need certain resources, such as seed, fertilizers, pesticides, packaging materials, and many others. Precisely because of that, transport is an essential aspect of crop production that enables delivery of agricultural resources to a farmer. Furthermore, transport is a burning component of post-harvest crop management. After all, every harvested crop needs to be transported, either directly from the field to the market, or to the packing house and storage.

Body:

In short, transport enables agriculture and emboldens the farmer to invest more and increase production. And without this transport system, large quantities of painstakingly farmed produce would be laid to waste. On the contrary, if an efficient transport system exists, and the agricultural produce is handled with care, the farmer can get the best possible returns.

Many farmers are cash-strapped and would like to dispose of the produce at the earliest. This means that even if the harvest is plentiful, the farmer can still be left in the lurch if the product cannot be reached beyond the boundaries of his town. His produce also needs to reach the consumer at a reasonable price and within a reasonable time.

Importance of transportation for agriculture in India:

- In India, less than one percent of the 105 million tons of perishable goods are transported via the 30,000 reefer vehicles that ply its roads. And the loss due to this amounts to Rs. 1 lakh crore.
- At the all-India level, the proportions of the produce that farmers are unable to sell in the market are 34 per cent, 44.6 per cent, and about 40 per cent for fruits, vegetables, and fruits and vegetables combined,” finds the Ashok Dalwai committee on Doubling of Farmers’ Income.
- This means, every year, farmers lose around Rs 63,000 crore for not being able to sell their produces for which they have already made investments.
- In the absence of robust and sustainable logistics mechanisms more than half of fruits and vegetable produce end up as waste even before they arrive in the market, said the National Horticulture Board four years ago.

Some of the modes of agricultural transport and the problems associated with it are as follows:

| Mode of transport | Advantages | Disadvantages |
|-------------------|---|---|
| Road | <ul style="list-style-type: none"> • Ideal for short distances; in that case, it's relatively cheap and fast enough • Loading and unloading is possible almost at any destination | <ul style="list-style-type: none"> • Expensive and less efficient for longer distances • Potential problems with traffic jams • Significantly contributes to air pollution |
| Rail | <ul style="list-style-type: none"> • Suitable for large quantities of goods that need to be transported on a long distance • Less dependant upon adverse weather conditions (such as heavy rain, snow, and fog) | <ul style="list-style-type: none"> • Less flexible than road transport mode (the infrastructure is not set everywhere, unloading and loading can be practiced only where it's allowed) • Expensive when practiced for short distances |
| Water | <ul style="list-style-type: none"> • Relatively cheap and efficient way of transporting large quantities of goods, as well as for long distances | <ul style="list-style-type: none"> • Relatively slow • The cargo can be loaded only in places with a suitable port |
| Air | <ul style="list-style-type: none"> • The fastest mode of transport • Efficient for long distances | <ul style="list-style-type: none"> • The most expensive • Not suitable for short distances |

Way forward:

- The significance of an efficient and modest marketing system is important to rural transport services (RTS) and infrastructure to speed up development.
- Adequate and cheap transport facilities so that farmer is able to reach Mandi rather than disposing it off at his village only.
- Enabling policies need to be put in place to encourage the procurement of agricultural commodities directly from farmers' fields and to establish effective linkage between the farm production and the retail chain and food processing industries.
- In India, the road network provide link between farms and market and secondly, transport equipment carries agriculture produce. The efficiency of road transport depends on the type of road provided.
- The Indian Railways with its Pan-India network is the optimal and preferred choice for movement of horticultural produce.
- About 1.9 per cent of the perishable fruits and vegetables are transported through rail, while 97.4 per cent of the produce is transported through roads. This ratio needs to shift in favour of rail network.
- An investment in creating a robust post-harvest storage and transportation by investing Rs 89,375 crore will also create over 3 million jobs.
- And a majority of which will be at the village level, thus empowering the local, rural economy.

Conclusion:

Transport is considered to be an important aspect in improving agricultural efficiency. It improves the quality of life of individuals, structures a market for agricultural productions, makes interaction possible among geographical as well as regions and opened up new areas to economic focus.

Evaluate the constitutional right of freedom of trade for Indian farmers. Do you think their freedom to market their produce at a place of their choice has been compromised in the country? Discuss. (250 words)

Reference: [The Hindu](#)

Why this question:

The question aims to evaluate the constitutional right of freedom of trade for Indian farmers and its true realization in the country.

Key demand of the question:

Explain the issues farmers have been facing in realizing their constitutional right of freedom of trade.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Start by discussing importance of Freedom for farmers to trade their produce.

Body:

Indian Farmers sell their products at Local Market, APMC, and MSP. Explain in what way the Essential commodities Act, 1955 and APMC Acts of States are the major reasons for the decline of rights of Farmers to sell their produce at the price of their choice. Mention the difficulties faced by farmers initially, acts hindering their marketing freedom. Suggest solutions to address the issues.

Conclusion:

Conclude with way forward.

Introduction

A study on agricultural policies in India by the **Indian Council for Research on International Economic Relations-Organisation for Economic Co-operation and Development (2018)**, concluded that the **restrictions on agricultural marketing** amounted to ‘implicit taxation’ on farmers to the tune of **₹45 lakh crore** from 2000-01 to 2016-17.

The restrictive trade and marketing policies being practised with respect to agricultural prices have substantially eroded the incomes of farmers.

Body

Challenges faced by farmers to market their produce

- **Restrictive Laws:** The **Essential Commodities Act, 1955**, and the **Agricultural Produce Market Committee (APMC) Acts** of the States are the principle sources of violation of the rights of farmers to sell their produce at a price of their choice.
 - These two laws severely restrict the options of farmers to sell their produce. Farmers continue to be the victims of a buyers’ market.
 - This is the principal cause of their exploitation.
- **Contradictory Objectives**
 - India’s agriculture policies have had multiple mandates, including a **production imperative** (national food security), a **consumer imperative** (keeping food prices low for a large low-income population), and a **farmer welfare imperative** (raising farmer’s income).

- Tensions between these mandates have resulted in costly, contradictory policies whose costs have been increasingly borne by farmers, the government purse, and the natural environment.
- **Lower income:** Their farm incomes are at the **mercy of markets, middlemen and money lenders**.
 - For every rupee that a farmer makes, others in the supply chain get much more.
 - Both farmers and consumers are the sufferers of the **exploitative procurement** and marketing of farm produce.
- **Consumer Oriented Policies:** Whenever there is a price rise in any agricultural commodity, the government imposes restrictions on exports to protect Indian consumers.
 - It creates hindrances for farmers taking advantage of high prices in foreign markets.
 - This, coupled with the Essential Commodities Act (ECA), has meant **lower private investment in export infrastructure** such as warehouses and cold storage systems.
 - This lack of storage infrastructure compels farmers to go for **Distress sale**.

Recent measures taken to alleviate farmer issues

- **Agri-Infrastructure:** The agricultural cooperative societies, farmer producer organizations (FPOs), and start-ups will be given funds worth ₹1 lakh crores to encourage farm-gate infrastructure.
 - This is to develop cold chain storage and other post-harvest management infrastructure at the farm gate and aggregation points.
 - Recently announced package has approximately ₹4 lakh crore support for farming and allied sectors, aimed at **improving infrastructure and enhancing credit support**.
- **Legislative reforms: The Essential Commodities Act, 1955**, will be amended to de-regulate cereals, edible oils, oilseeds, pulses, onion, and potato.
 - Reforms in the Agri-Marketing are to be given serious concern to provide adequate choice to farmers for selling their produce at fair prices.
 - Laws to bring in **Contract farming** can help establish forward and backward linkage for agriculture and realisation of better farm incomes. It will help with modern technology adoption as well.
 - **APMC laws** will be amended, so that farmers will be free to sell their produce anywhere, even to private players directly. This will encourage more **private mandis to be set up**, where farmers will get better price for their crops without being victim to cartelization.
 - The above three reforms will create all India market for farmers to sell their produce.
- **Support to animal husbandry and fisheries:** The fishermen will be allocated ₹20,000 crore under **PM Matsya Sampada Yojana**.
 - This underlines the need for **diversifying the income sources of farmers**.

- The fish production is expected to grow more than 70 lakh tonnes over 5 years with this fund allocation.
- The beekeeping segment has been assigned ₹500 crores.
- This will augment income sources especially for the tribal people who live on minor forest produce. Skill development in bee-keeping has also been a major focus in recent times.

Way Forward

- While allowing several buyers to directly access the produce from the farmers, a strong and effective network of **Farm Producers' Organisations should be created** to enhance the **bargaining power of farmers**.
 - This will ensure that individual farmers are not exploited.
- Freeing up input prices to market levels, or charging an optimum cost pricing for fertilisers, power, agri-credit, and canal waters fees.
- Channelizing the resulting savings for expenditures on investments in agricultural R&D, irrigation, marketing infrastructure, building value chains by involving Farmer Producer Organisations (FPOs) and linking farms to organised retail, food processing, and export markets.
- **Direct income transfers to farmers'** should be promoted by leveraging the trinity of **Jan Dhan–Aadhaar–Mobile (JAM)** to reduce the leakages and pilferage.
- The Model Land Lease Act, 2016 offers an appropriate template for the states and UTs to draft their own piece of legislations, in consonance with the local requirements and adopt an enabling Act
 - In remote dry areas, leasing land to solar or wind power companies could provide farmers with relatively higher and steadier incomes.
- Robust agriculture exports will increase the demand for India's farm output (and hence, incomes of farmers).

Conclusion

It is time to allow the farmers to sell their produce anywhere, in return for the highest bidder. All stakeholders should be taken on board while revising restrictive agri-marketing laws. The reforming of laws will not only help farmers get better income but also help consumers who are also most hit by the current slowdown and pandemic. The target of achieving **Doubling Farmers income by 2022** will be closer to being successful.

Issues related to direct and indirect farm subsidies and minimum support prices; Public Distribution System- objectives, functioning, limitations, revamping; issues of buffer stocks and food security; Technology missions; economics of animal-rearing.

Do you think the current pandemic poses the right opportunity to put India's agri-marketing and PDS system on a more efficient path? Examine.(250 words)

Reference: [Indian Express](#)

Why this question:

The author Ashok Gulati brings to us a detailed overview of the opportunity that the current pandemic has brought to the PDS system of the country.

Key demand of the question:

Explain the opportunities that the COVID-19 pandemic has brought to the PDS system and India's agri marketing system and what needs to be done to encash the same.

Directive:

Examine – When asked to 'Examine', we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Briefly explain the existing structure of Indian agri markets and the PDS system.

Body:

To start with, highlight the fact that despite initial disruptions in supply lines, India has somehow managed to feed its large population of 1.37 billion. There have been no large-scale food riots and no major flaring up of food prices for consumers. Talk about the large scale reforms in agri-marketing as well as in the public distribution system (PDS) that are required. Take hints from the article and explain the dos and don'ts. Highlight the significance of the opportunity that India has right now in this sector and what Indian policy makers should actually do.

Conclusion:

Conclude with way forward.

Introduction

Despite initial disruptions in supply lines, India has somehow managed to feed its large population of 1.37 billion. There have been no large-scale food riots and no major flaring up of food prices for consumers.

Body

The nationwide lockdown resulted in a collapse in demand, forcing farmers to throw away, re-plough or feed their cattle with perishable produce like vegetables, flowers, poultry and milk.

Reforms needed Agri-Marketing and PDS system

- **Market reforms:** It is time to open channels for direct buying from farmers/farmer producer organisations (FPOs). Any registered large buyer, be it processors or retail groups or exporters must be encouraged by providing them with a license, that is valid all over India.
 - **Eg: Karnataka passed an ordinance to amend the APMC Act.** With this ordinance farmers will no longer be bound to the more than 160 APMC markets in the State and they can sell their produce to private players as well.

- **Exempt from cess/tax:** Farmer produce should be exempted from any market fee and other cesses as they will not be using the services of the APMC market yards.
- **E-NAM** can flourish if grading and dispute settlement mechanisms are put in place.
- **Private mandis** with modern infrastructure need to be promoted in competition with APMCs.
- Another reform pertains to the possibility of another legislation to promote **contract farming** and **linking it to futures commodity markets**.
- **Public Distribution System:** On the PDS front, we need to move towards cash transfers that can be withdrawn from anywhere in the country.
 - Government is also in process of implementing **One Nation One Ration Card** that will help the migrants immensely in accessing their benefits all over India and have food security during the time of crisis.
- **Stimulus to Agriculture:** It is an opportune moment to strengthen the farm gate infrastructure.
 - Laws to bring in **Contract farming** can help establish forward and backward linkage for agriculture and realisation of better farm incomes. It will help with modern technology adoption as well.
 - Bee-keeping and fisheries (aquaculture and mariculture) needs to be given impetus to ensure alternate sources of income during non-agricultural season.
 - Infrastructure such as **cold storage and Kisan Rail** will help in preservation of perishables and maintain quality during transport.
- **The Essential Commodities Act, 1955**, that controls trade and commerce of certain commodities will be amended to help realize better prices for farmers by letting them choose their buyers and through deregulation of some crop items.

Significance of opportunity in India's agri-market and food sector

- **Growth and prosperity:** Agriculture still engages India's largest workforce, with nearly 48% population.
 - And it may be the only sector that registers a respectable growth this year as almost all other major sectors may plummet into negative territory.
 - This will help absorb the shock of the coronavirus on **extreme poverty and malnutrition**.
 - With majority migrant workers returning back to their native states, it is time to focus on "Doubling farm income" with even more vigour.
- **APMC and market reforms:** APMCs' jurisdiction would be limited to their respective markets and they can levy cess only on transactions within the market area.
 - Private entities can set up their markets/market committees, which will attract investment in infrastructure and offer farmers competitive remuneration.
 - The **new unified trading licence** will let traders participate in markets all over the state and they can buy directly from farmers **without having to pay APMCs a fee**.

- **Providing cash in the hands of farmers** will help create more demand as the economists have been suggesting, and for the farmers it will also provide them with some resources to plan for the sowing of paddy crop in the days to come.
- **Better inter-state movement** of agricultural commodities will help in creating linkage between deficit and surplus states. Meanwhile it'll help revive the supply chains and the ancillary activities in the process (transport, warehousing etc.)

Conclusion

The farm sector has been the worst hit and the same time also the most essential and crucial sector of the economy that needs handholding. The major problem in agriculture is not production but marketing. The APMC markets are monopolistic, rent-seeking, they charge high rates of commission. Thus, the marketing reforms will provide better avenues for farmers to sell their produce and at the same time ensure food security for Indians, especially those in the lower strata.

Analyze in detail the provisions for the agricultural sector under the Atmanirbhar Bharat Abhiyan that was launched recently. (250 words)

Reference: [Economic Times](#)

Why this question:

The third tranche of the Atmanirbhar Bharat Abhiyan has listed measures to deal with critical infrastructure gaps and long-pending governance issues that plague the farm sector. Thus the question.

Key demand of the question:

The question is straight forward and aims to assess the benefits that the Atmanirbhar Bharat Abhiyan would render to the agriculture sector in the country.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Briefly explain the coming of Atmanirbhar Bharat Abhiyan into action.

Body:

To start with, explain the provisions given by the finance minister to the agri sector in the Atmanirbhar Bharat Abhiyan. Straight away discuss the provisions made for the agri sector in the tranche. Explain the benefits that it would render and how it would help the sector become self-reliant. Point out to challenges if any while suggesting solutions to the same.

Conclusion:

Conclude with way forward.

Introduction

The recent fund allocation of **Rs 1 lakh crore** under the third tranche of **Atmanirbhar Bharat Abhiyan** underpins the importance of infrastructural development in the agriculture sector and allied activities, especially in local supply systems.

This fund comes as a breather for the farmer producer organisations (FPOs), farmer cooperative societies, agri-entrepreneurs and start-ups which want to integrate and access these facilities within the vicinity of their farmgate and aggregation points.

Body

Provisions for agricultural sector under Atmanirbhar Bharat

- **Food Enterprises:** The announcement of **Rs 10,000 crore funds** for Food Micro Enterprises, which will benefit 2 lakh micro enterprises/ startups is a welcome step.
 - This will strengthen the food micro-enterprises/startups who are facing multiple issues like limited access to capital, lean workforce, vulnerability to sudden market changes, low-risk appetite and high dependency on supply chains.
 - These enterprises can go global with their specialty products such as **saffron in Kashmir, ragi in Karnataka and Makhana in Bihar.**
- **Agri-Infrastructure:** The agricultural cooperative societies, farmer producer organizations (FPOs), and start-ups will be given funds worth ₹1 lakh crores to encourage farm-gate infrastructure.
 - This is to develop cold chain storage and other post-harvest management infrastructure at the farm gate and aggregation points.
- **Fisheries:** The fishermen will be allocated ₹20,000 crores under PM Matsya Sampada Yojana. This is being done to boost the fishery segment. The fish production is expected to grow more than 70 lakh tonnes over 5 years with this fund allocation.
- **Livestock:** To ensure **100% vaccination** of cattle, buffalos, sheep, goats, and pigs, a fair amount of **₹13,000 crores** has been allocated.
 - **Animal husbandry** infrastructure has gained a ₹15,000 crore under the Atmanirbhar Bharat Scheme.
- **Medicinal plants:** To carry out the efficient promotion of herbal cultivation, ₹4,000 crores have been allotted.
 - It is expected to boost herbal cultivation in an area of 10 lakh hectare in 2 years.
- **Bee-keeping:** The beekeeping segment has been assigned ₹500 crores. This will augment income sources especially for the tribal people who live on minor forest produce. Skill development in bee-keeping has also been a major focus in recent times.
- **Market reform:** The Essential Commodities Act, 1955, will be amended to de-regulate cereals, edible oils, oilseeds, pulses, onion, and potato.
 - Reforms in the Agri-Marketing are to be given serious concern to provide adequate choice to farmers for selling their produce at fair prices.

Shortcomings

- **Repackaging of existing schemes:** The third tranche of reforms for Agri-sector was replete with additions to existing schemes or reiterations of the government's commitment to certain programmes.
- **No immediate relief to farmers:** The missing item from the third tranche were measures which could provide immediate relief to farmers that have been hit hard by the curbs on movement and transport of goods. There is no component of compensation in the package either.
- Agri-Economists like **Ashok Gulati** have criticised government for not raising the PM-KISAN money to 10,000 to aid farmers for the coming cropping season.

Conclusion

There is a greater need to create a better trade facilitation framework which can help farmers to make effective decisions for selling his produce and support during the entire transaction. Therefore, the need of the hour is to develop infrastructure, which will not only support the local supply systems but also help capitalise on high demand, high price markets at distant locations.

Do you think the reforms proposed for agricultural sector under the realm of Aatmanirbhar Bharat Abhiyaan ensure better price realization for farmers? Elucidate. (250 words)

Reference: [The Hindu](#)

Why this question:

The question is amidst the farm sector tranche that was announced by the finance minister recently under the Aatmanirbhar Bharat Abhiyaan.

Key demand of the question:

Explain the possibility of the package given to the farm sector in ensuring price realization to the farmers.

Directive:

Elucidate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

The pandemic Covid19 has highlighted the persistent and deep rooted problem of Indian agriculture system, thus the context of the question.

Body:

Students must remember that the question is not about the scheme the question is about how the scheme helps the farmer for price realization. Thus one has to discuss the possible positives that the scheme could bring to the farm sector and mention associated challenges if any.

Conclusion:

Conclude with what more needs to be done and in what way one particular scheme may not suffice to aid price realization and the approach needs to be multi-pronged.

Introduction

The Centre's objective of using the COVID-19 crisis to usher in an **Atmanirbhar Bharat** saw the Finance Minister, focus the third tranche of announcements on farm sector reforms. The centrepiece was the promises of **three legal reforms to ease up agriculture marketing** and the reinforcement and expansion of certain schemes that had been announced by the Centre in the past.

Body

Advantages of the reforms proposed for Agriculture Sector

- **Food Enterprises:** The announcement of **Rs 10,000 crore funds** for Food Micro Enterprises, which will benefit 2 lakh micro enterprises/ startups is a welcome step.
 - This will strengthen the food micro-enterprises/startups who are facing multiple issues like limited access to capital, lean workforce, vulnerability to sudden market changes, low-risk appetite and high dependency on supply chains.
 - These enterprises can go global with their specialty products such as **saffron in Kashmir, ragi in Karnataka and Makhana in Bihar.**

- **Agri-Infrastructure:** The agricultural cooperative societies, farmer producer organizations (FPOs), and start-ups will be given funds worth ₹1 lakh crores to encourage farm-gate infrastructure.
 - This is to develop cold chain storage and other post-harvest management infrastructure at the farm gate and aggregation points.
 - Given that the lack of adequate cold-storage facilities continues to extract a high price on farmers and the agrarian economy by way of post-harvest losses, especially in perishables, the targeted outlay is a welcome step.
- **Fisheries:** The fishermen will be allocated ₹20,000 crore under PM Matsya Sampada Yojana.
 - This is being done to **boost the fishery segment**. The fish production is expected to grow more than 70 lakh tonnes over 5 years with this fund allocation.
- **Livestock:** To ensure **100% vaccination** of cattle, buffalos, sheep, goats, and pigs, a fair amount of **₹13,000 crores** has been allocated.
 - **Animal husbandry** infrastructure has gained a ₹15,000 crore under the Atmanirbhar Bharat Scheme.
 - It will augment farm income and **boost household revenue of 2/3rd rural families**.
- **Medicinal plants:** To carry out the efficient promotion of herbal cultivation, ₹4,000 crores have been allotted.
 - It is expected to boost herbal cultivation in an area of 10 lakh hectare in 2 years.
 - Farmers can cultivate on their fallow land and utilise additional income as social security.
- **Bee-keeping:** The beekeeping segment has been assigned ₹500 crores. This will augment income sources especially for the tribal people who live on minor forest produce. Skill development in bee-keeping has also been a major focus in recent times.
- **One nation one market reform: The Essential Commodities Act, 1955**, will be amended to de-regulate cereals, edible oils, oilseeds, pulses, onion, and potato.
 - Reforms in the Agri-Marketing are to be given serious concern to provide adequate choice to farmers for selling their produce at fair prices.
 - Laws to bring in **Contract farming** can help establish forward and backward linkage for agriculture and realisation of better farm incomes. It will help with modern technology adoption as well.
 - APMC laws will be amended, so that farmers will be free to sell their produce anywhere, even to private players directly. This will encourage more private mandis to be set up, where farmers will get better price for their crops without being victim to cartelization.
 - The above three reforms will create all India market for farmers to sell their produce.

Concerns and challenges still remain

- **Law must not be repealed:** The Economic Survey 2020, had recommended jettisoning the “anachronistic” **Essential commodities Act (ECA)**.

- But the law has nonetheless remained a vital tool in the government's armoury for protecting consumers from irrational volatility in the prices of essentials by tamping down on black marketeers and hoarders.
- **Affect food prices:** While the **ECA Act's** provisions do have scope for an overzealous bureaucracy to harass even an honest exporter, who may have paid a fair price to the farmer and stocked produce for shipment overseas, total deregulation for foodgrains is fraught with the risk of future inflationary food price spikes.
- **Market reforms:** The other two proposals related to APMC are also of concern.
 - The first reform seeks to **bypass the APMC regime** through a central law that would allow farmers the freedom to **sell across State borders**, the other proposes a framework for farmers (**Contract farming**) to enter into **pre-sowing contracts** that would purportedly help assure them of offtake volumes and prices.
 - Both the changes, once enacted, **could privilege market forces without** necessarily safeguarding **food security**. Surely, it would be in no one's interest to throw the baby out with the bathwater.
- **Lack of immediate relief:** The government has failed to provide compensation and relief to farmers for the losses suffered during the lockdown, primarily because it lacks the fiscal space.
 - Political scientists pointed out that while the governance reforms of Essential commodities Act and agricultural marketing **are good long-term measures**, yet the much-spoken **Jan Dhan, Aadhaar and Mobile trinity was not of much use to** address the distress of the poor.

Conclusion

Along with the long-term measures envisioned by the Centre under the Atmanirbhar Abhiyaan, it must be ensured that the farmers be given enough liquidity to manage the crisis due to lockdown and slump in demand. States must coordinate to ensure the supply chain for agri-produce is functioning at all times, while realising better farm incomes.

Explain the Contributions of Livestock Sector to Indian Economy.(250 words)

Reference: *Indian Geography by Majid Hussain*

Why this question:

The question is straightforward from the static portions of GS paper III.

Key demand of the question:

Explain in detail the contributions of Livestock Sector to Indian Economy.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Briefly explicate what constitutes the livestock sector in the country, quote some relevant and latest facts.

Body:

To start with, explain that about 20.5 million people depend upon livestock for their livelihood. Livestock contributed 16% to the income of small farm households as against an average of 14% for all rural households. Livestock provides a livelihood to two-third of the rural community. It also provides employment to about 8.8 % of the population in India. Then discuss the importance of

animals as an efficient and economical means of food production. Discuss what needs to be done to augment the sector. Suggest the policy measures that exist in this direction.

Conclusion:

Conclude with way forward.

Introduction

Economic Survey 2020 noted that livestock sector has grown at a compound annual growth rate of **7.9 per cent** during last five years. Livestock income has become an important secondary source of income for rural families and has assumed an important role in achieving the goal of doubling farmers' income.

Body

Livestock Data: India

- The total number of cattle in the country is 192.49 million in 2019 shows an increase of 0.8 per cent.
- **Small Ruminant Sector:** Sheep and goat are collectively known as small ruminants.
 - India supports 16.1 per cent of the world's goat population and 6.4 per cent of its sheep (FAO).
- **20th Livestock Census:** India is the world's highest livestock owner at about 535.78 million.
 - First in the total buffalo population in the world – 109.85 million buffaloes.
 - Second in the population of goats – 148.88 million goats.
 - Second largest poultry market in the world.
 - Second largest producer of fish and also second largest aquaculture nation in the world.
 - Third in the population of sheep (74.26 millions)
 - Fifth in in the population of ducks and chicken (851.81 million)
 - Tenth in camel population in the world – 2.5 lakhs

Contributions of Livestock Sector to Indian Economy

- **Employment:** According to NSSO's 68th Round Survey on Employment and Unemployment, 16.44 million workers were engaged in the activities of farming of animals, mixed farming, fishing and aquaculture.
- **Largest Milk Producer:** India is the largest producer of milk in the world.
 - Milk production in the country was 188 million tonnes in 2018-19 with a yearly growth rate of 6.5 percent resulting in increased per capita availability to 394 grams per day.
- **Income:** About 20.5 million people depend upon livestock for their livelihood. Livestock contributed **16% to the income of small farm households** as against an average of 14% for all rural households.
 - Livestock provides livelihood to two-third of rural community. As per the 70th round of NSSO, livestock rearing is a principal source of income to 3.7 per cent of the agricultural households.

- Livestock sector contributes **11% GDP and 25.6% of total Agriculture GDP**.
- **Food:** The livestock products such as milk, meat and eggs are an important source of animal protein to the members of the livestock owners. The per capita availability of milk is around 375 g / day; eggs is 74 / annum during 2017-18.
- **Social security:** The animals offer social security to the owners in terms of their status in the society. The families especially the landless which own animals are better placed than those who do not.
- **Draft:** Bullocks are the back bone of Indian agriculture. Despite lot of advancements in the use of mechanical power in Indian agricultural operations, the Indian farmer especially in rural areas still depend upon bullocks for various agricultural operations.
 - The bullocks are saving a lot on fuel which is a necessary input for using mechanical power like tractors, combine harvesters etc.
 - Pack animals like camels, horses, donkeys, ponies, mules etc are being extensively used to transport goods in different parts of the country in addition to bullocks.
 - In situations like hilly terrains mules and ponies serve as the only alternative to transport goods.
 - Similarly, the army has to depend upon these animals to transport various items in high areas of high altitude.
- **Dung:** In rural areas dung is used for several purposes which include fuel (dung cakes), fertilizer (farm yard manure), and plastering material (poor man's cement).
- **Fisheries Sector:** The sector provides livelihood to about 16 million fishers and fish farmers at the primary level and almost twice the number along the value chain.
 - **Share in Agricultural GDP and export:** The sector accounts for **58 percent of GDP from agriculture**, forestry and fishing.
 - Also, the sector is one of the major contributors of foreign exchange earnings with India being one of the **leading seafood exporting nations** in the world.
 - **Fish Production:** The total fish production in the country was 13.42 million metric tonnes (MMT) during 2018-19. (Marine fisheries- 3.71 MMT and Inland fisheries- 9.71 MMT)

Challenges faced by the Livestock sector in India

- **Productivity:** Improving the productivity of farm animals is one of the major challenges. The average annual milk yield of Indian cattle is 1172 kg which is only about 50 per cent of the global average.
- **Diseases:** The frequent outbreaks of diseases like **Foot and Mouth Diseases, Black Quarter infection; Influenza, etc.** continue to affect livestock health and lowers productivity.
- **Greenhouse Gases:** India's huge population of ruminants contributes to greenhouse gases emission. Reducing greenhouse gases through mitigation and adaptation strategies will be a major challenge.
- **Loss of indigenous breeds:** Crossbreeding of indigenous species with exotic stocks to enhance the genetic potential of different species has been successful only to a limited extent.

- **Limited Artificial Insemination** services owing to a deficiency in quality germplasm, infrastructure and technical manpower coupled with poor conception rate following artificial insemination have been the major impediments.
- **Less credit:** The sector received only about **12 per cent of the total public expenditure on agriculture and allied sectors**, which is disproportionately lesser than its contribution to agricultural GDP. The sector has been neglected by financial institutions.
- **Meat production and market:** Likewise, slaughtering facilities are inadequate. About half of the total meat production comes from un-registered, make-shift slaughterhouses. Marketing and transaction costs of livestock products are high taking 15-20 per cent of the sale price.

Measures by government to improve livestock sector

- **Rashtriya Gokul Mission (RGM):** To undertake breed improvement programme for indigenous breeds so as to improve the genetic makeup and increase the stock.
- **E-Pashu Haat Portal:** This portal is for connecting breeders and farmers regarding availability of quality bovine germplasm.
- **National Livestock Mission:** IT is for intensive development of livestock, especially small livestock along with adequate availability of quality feed and fodder.
- **Livestock Health & Disease Control Scheme:** Assistance is provided for prevention and control of animal diseases like Foot and Mouth Disease (FMD) etc.
- **Dairy Development:** For strengthening infrastructure for production of quality milk, procurement, processing and marketing of milk and milk products through the following dairy development schemes.
- **Disease Protection of Livestock:** For livestock protection, the diagnostic kits against Japanese Encephalitis (JE) and Bluetongue (BT) diseases and Subviral Particle based Infectious Bursal Disease Vaccine were developed.
- **Fisheries and Aquaculture Infrastructure Development Fund (FIDF):** FIDF provides concessional finance/ loan to the Eligible Entities (EEs), including State Governments/UTs and State entities for development of identified fisheries infrastructure facilities.
 - **Independent Department:** Recognising the importance of the sector, an independent Department of Fisheries has been created in 2019.

Conclusion

Policymakers in India are finally acknowledging a structural shift in the agriculture sector they have been noticing for a decade. Livestock now controls a quarter of the agriculture gross domestic product (GDP). The livestock sector is performing well in the manner of production, value addition, and export of dairy, fishery, wool, poultry, and other products. Apart from its performance, some threats also exist; we need to overcome them to grab the global market opportunities.

Examine the problem of locust invasion that has caused an unusual threat to food security and livelihood in parts of East and West Africa, South West Asia, and India, What measures need to be taken? Discuss. (250 words)

Reference: [Indian Express](#)

Why this question:

The article explains why locusts are being sighted in urban areas, what it can mean for crops.

Telegram: <https://t.me/insightsIAStips>

Youtube: <https://www.youtube.com/channel/UCpoccbCX9GEIwaile4HLjwA>

Facebook: <https://www.facebook.com/insightsonindia>

**Key demand of the question:**

Explain problem of locust invasion that has caused an unusual threat to food security and livelihood in parts of East and West Africa, South West Asia, and India while suggesting measures that need to be taken.

Directive:

Examine – When asked to ‘Examine’, we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:**Introduction:**

Briefly explain the issue of Locusts in the country. The first swarms were sighted along the India-Pakistan border on April 11, months ahead of the usual time of arrival.

Body:

To start with, explain what are locusts and when are they are sighted in India. Explain the issue – These insects feed on a large variety of crops. If not controlled, locust swarms can threaten the food security of a country. At present countries in the Horn of Africa such as Ethiopia and Somalia are witnessing one of the worst locusts attacks in the last 25 years. Present the case of current locust storms that have infested north- western parts of India. Explain in what way they lead to food insecurity if not controlled. Present the case of India.

Conclusion:

Suggest measures to address the issue.

Introduction:

Locusts are a group of short-horned grasshoppers that multiply in numbers as they migrate long distances in destructive swarms (up to 150km in one day). In recent weeks, locust swarms have attacked crops in more than a dozen countries in Asia and Africa. Swarms of locusts are being sighted early in India and in areas not historically associated with such sightings.

Body:**Locusts:**

- They are a collection of certain species of short-horned grasshoppers in the family Acrididae that have a swarming phase.
- These insects are usually solitary, but under certain circumstances they become more abundant and change their behaviour and habits, becoming gregarious.
- No taxonomic distinction is made between locust and grasshopper species; the basis for the definition is whether a species forms swarms under intermittently suitable conditions.
- These grasshoppers are innocuous, their numbers are low, and they do not pose a major economic threat to agriculture.
- However, under suitable conditions of drought followed by rapid vegetation growth, serotonin in their brains triggers a dramatic set of changes: they start to breed abundantly, becoming gregarious and nomadic (loosely described as migratory) when their populations become dense enough.
- They form bands of wingless nymphs which later become swarms of winged adults. Both the bands and the swarms move around and rapidly strip fields and cause damage to crops.
- The adults are powerful fliers; they can travel great distances, consuming most of the green vegetation wherever the swarm settles

**Locusts in India:**

- The first swarms were sighted along the India-Pakistan border on 11th April 2020, months ahead of the usual time of arrival.
- Agriculture Ministry's Locust Warning Organization (LWO) reported the first sightings in Rajasthan's Sri Ganganagar and Jaisalmer districts.
- In India, locusts are sighted normally during July- October along the Pakistan border.
- In 2019, parts of Western Rajasthan and Northern Gujarat reported swarms that caused damage to growing rabi crops.
- These were the first swarms reported in India since 1997.
- Locusts are being seen in areas not historically associated with such sightings.
- These areas include urban areas of Rajasthan including Jaipur, Madhya Pradesh's Gwalior, Morena and Sheopur.
- Also, stray swarms are seen in Vidharbha region of Maharashtra's Amravati, Nagpur and Wardha.
- Since there are no crops in the fields, the locusts have moved across states attracted by green cover.
- The swarms were aided by high-speed wind and thus they made their way to Jaipur.
- At present, there are 3 to 4 swarms in Rajasthan, another 2 or 3 in Madhya Pradesh.
- From Madhya Pradesh, a group has migrated to Maharashtra, which is not very difficult to control.

Implications for crops in India:

- At present, chances of crop damage are low given that farmers have already harvested their rabi crop.
- The bigger problem will come once the present swarms breed.
- An adult female locust lays 80-90 eggs thrice in her three-month life cycle.
- If left uncontrolled, a swarm can grow exponentially to 40-80 million locusts per square kilometre.
- The locusts will start laying eggs after the monsoon starts and continue breeding for two more months.
- The newer generations may rise during the growth phase of kharif crop.
- In May 2020, Union Agriculture Minister chaired a meeting to take stock of the situation.
- Control involves spraying insecticide on locusts' night resting places like trees using drones.
- India has also put an order of 60 specialised insecticide sprayers with the UK, with India already having 50 such machines.

Measures to control:

- Bio Control: Control by natural predators and parasites so far is limited since locusts can quickly move away from most natural enemies. The most effective controls were natural ones: crows, mynahs, starlings, storks, bustards, vultures and other birds all congregated to feast on locusts.
- LWO role: The locust hunters in both countries have coordinated with military authorities like the Border Security Force to set up regular meetings at border points.
- Controlling desert locust swarms primarily uses organophosphate chemicals by vehicle-mounted and aerial sprayers, and to a lesser extent by knapsack and hand-held sprayers.
- Extensive research is ongoing regarding biological control and other means of non-chemical control with the current focus on pathogens and insect growth regulators.

Conclusion:

While climate change is a global phenomenon, **developing countries and least developed countries stands out for its vulnerability** which is driven primarily by the prevailing low levels of socioeconomic development. Persons living in poverty face compounding vulnerabilities to climate change impacts because they lack the resources to quickly recover from its effects. In this case, desert locusts are ravaging crops in the field before harvesting, wiping out livestock and wildlife feed, and with them savings, assets and livelihoods. Deployment of **climate action solutions** such as **decentralizing solar dryers to agro-value chain actors** can ensure that they can earn up to 30 times more by being able to preserve their harvest and sell during the offseason or gives them flexibility to compensate for unpredictable events such as these locust swarms.

Food processing and related industries in India- scope and significance, location, upstream and downstream requirements, supply chain management.

Examine the Potential and challenges of Pink Revolution in India.(250 words)

Reference: [The Hindu](#)

Why this question:

The question is based on the static theme of “Food processing and related industries in India” and its significance.

Key demand of the question:

The question is straightforward and aims to examine the potential and challenges of Pink revolution.

Directive:

Examine – When asked to ‘Examine’, we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Define what you understand by Pink revolution.

Body:

Pink Revolution is a term used to denote the technological revolutions in the meat and poultry processing sector. Meat and poultry processing sector in the country has great potentials for growth. The present meat consumption per capita of around 6 grams per day will improve to 50 grams a day in the next decade or so. When such phenomenal increase in meat consumption occurs, the sector will witness a tremendous growth. Despite India’s large livestock Population, India accounts only around 2 percent of global market. Challenges include creating standard policies for meat production and export, standardizing the quality and safety aspects of meat and poultry, and creating infrastructure facilities for modern slaughter houses, meat testing facilities and cold storages for the growth of the meat and poultry processing sector.

Conclusion:

Conclude with solutions.

Introduction:

Pink revolution refers to the modernization or technological revolutions of the meat and poultry processing sector in India. India has already seen the ‘green’ and ‘white’ revolutions in its food industry – related to agriculture and milk respectively, now thrust is upon meat and poultry sector. India being a country of huge cattle and poultry population, has high potential for growth if this sector is modernized.

Body:

Current scenario:

- According to the Agricultural and Processed Food Products Export Development Authority (APEDA), India's buffalo meat exports have fallen 9% in 2018-19 from a year ago to the lowest level in six years.
- The present meat consumption per capita of around 6 grams per day will improve to 50 grams a day in the next decade or so. When such phenomenal increase in meat consumption occurs, the sector will witness a tremendous growth.
- Despite India's large livestock population, India accounts only around 2 percent of global market.
- China had stopped buying Indian meat on fear of the foot and mouth disease a few years ago.
- Exporters said the devaluation of currencies of Brazil and Argentina had also made Indian supplies less competitive.
- China was a bulk consumer a few years ago and there was a safety net for the industry in terms of consistent volume of trade.

Potential of pink revolution:

- India is having a good potential for meat production because of large livestock population.
- About 20.5 million people depend upon livestock for their livelihood.
- Livestock contributed 16% to the income of small farm households as against an average of 14% for all rural households.
- Livestock provides livelihood to two-third of rural community.
- It also provides employment to about 8.8 % of the population in India. India has vast livestock resources.
- Livestock sector contributes 4.11% GDP and 25.6% of total Agriculture GDP.
- Meat exported from India is risk-free, lean, nutritious and competitively priced meat.
- It has resulted in consistent, high compound growth rate in the export volumes.
- The importers of Indian meat are Vietnam, Malaysia, Thailand, Australia, UAE, Saudi Arabia and Egypt.
- Uttar Pradesh state has emerged as the major exporter of buffalo meat followed by Punjab and Maharashtra.
- The value addition to slaughterhouse by products generate additional income as well as the costs of disposing of by products can be minimized.
- There is huge potential in this sector for economic development of country through increasing exports so the policy makers should adopt critical measures at every stage to encourage and support this vital segment of the Indian agriculture.

Challenges of Pink revolution:

- Livestock sector did not receive the policy and financial attention it deserved. The sector received only about 12% of the total public expenditure on agriculture and allied sectors, which is disproportionately lesser than its contribution to agricultural GDP.
- The sector has been neglected by the financial institutions.
 - The share of livestock in the total agricultural credit has hardly ever exceeded 4% in the total (short-term, medium-term and long-term). The institutional mechanisms to protect animals against risk are not strong enough.
- **Insurance:**

- Currently, only 6% of the animal heads (excluding poultry) are provided insurance cover. Livestock extension has remained grossly neglected in the past.
- Only about 5% of the farm households in India access information on livestock technology. These indicate an apathetic outreach of the financial and information delivery systems.
- **Lack of access to markets** may act as a disincentive to farmers to adopt improved technologies and quality inputs.
- **Productivity:**
 - Improving productivity of farm animals is one of the major challenges. The average annual milk yield of Indian cattle is 1172 kg which is only about 50% of the global average.
- **Diseases:**
 - The Frequent outbreaks of diseases like Food and Mouth Diseases, Black Quarter infection, Influenza etc. continue to affect Livestock health and lower the productivity.
- **Environment:**
 - India's huge population of ruminants contributes to greenhouse gases emission adding to global warming. Reducing greenhouse gases through mitigation and adaptation strategies will be a major challenge.
- **Crossbreeding of indigenous species** with exotic stocks to enhance genetic potential of different species has been successful only to a limited extent.
- **Limited Artificial Insemination services** owing to a deficiency in quality germplasm, infrastructure and technical manpower coupled with poor conception rate following artificial insemination have been the major impediments.
- Livestock derives a major part of their energy requirement from agricultural by-products and residues. Hardly 5% of the cropped area is utilized to grow fodder. India is deficit in dry fodder by 11%, green fodder by 35% and concentrates feed by 28%. The common grazing lands too have been deteriorating quantitatively and qualitatively.
- Except for poultry products and to some extent for milk, markets for livestock and livestock products are underdeveloped, irregular, uncertain and lack transparency. Further, these are often dominated by informal market intermediaries who exploit the producers.
- Likewise, **slaughtering facilities are too inadequate**. About half of the total meat production comes from un-registered, make-shift slaughterhouses. Marketing and transaction costs of livestock products are high taking 15-20% of the sale price.

Measures needed to propel the pink revolution in India:

- A national breeding policy is needed to upgrade the best performing indigenous breeds.
- Measures should be taken to increase the meat production efficiency of different species of animals using the improved management practices.
- Adoption of improved shelter management practices can reduce the environmental stress.

- New breeds should be developed for meat production with higher feed conversion efficiency, faster growth and disease resistant.
- Health management practices should be followed for prevention of diseases and economic loss to the farmers.
- Regular prophetic health measures should be carried out against infectious diseases.
- Regular screening of animals should be carried out against disease such as tuberculosis, brucellosis, salmonellosis etc.
- The livestock market yard should have basic facilities for feeding, watering and holding animals for days.
- By vertical integration with meat processing industries the middle men can be eliminated, which will ultimately increase the profit of farmers.
- There is need for modernizing the quality control laboratories of the State Government, apart from need for strict laboratory inspection of meat and meat products, training programs for meat workers regarding hygiene and sanitation need to be organized regularly.
- Modernization of abattoirs, setting up of rural abattoirs and registration of all slaughter houses in cities/towns are essential for quality meat production.
- The setting up of large commercial meat farms have been recommended to address the traceability issues necessary for stringent quality standards of CODEX.

Way forward:

In a report titled the '**Indian Meat Industry Perspective**', the **FAO** outlined four steps that should be taken if India's food industry is to successfully go pink. These recommended steps were: **setting up state of the art meat processing plants; developing technologies to raise male buffalo calves for meat production; increasing the number of farmers rearing buffalo under contractual farming; and establishing disease-free zones for rearing animals.**

Conclusion:

Being a secular country the focus should be more on professional aspect of market rather than religious aspect. India needs legislations and willingness to make India fair play ground not only for domestic entrepreneurs but also for global players in meat and poultry business.

Discuss the Scope and Significance of Food Processing Industries in India. (250 words)

Why this question:

The question is straightforward from the static portions of GS paper III.

Key demand of the question:

Explain the Scope and Significance of Food Processing Industries in India.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

The food processing industry in India is increasingly seen as a potential source for driving the rural economy as it brings about synergy between the consumer, industry and the farmer.

Body:

To start with, explain the importance of food processing industry. Food processing activity is still at a nascent stage in India with low penetration. List down the importance of food processing industry – Holds the potential of reducing enormous wastage of agricultural produce in the absence of

processing technologies and cold chain facility, is labour-intensive industry, lead to increase in farm income etc. Discuss the conditions favorable for food processing. Highlight the importance of it.

Conclusion:

Conclude with significance of it to Indian economy.

Introduction:

Food processing generally includes the basic preparation of foods, the alteration of a food product (usually raw) into another form (as in making preserves from fruit), and preservation and packaging techniques. Food processing typically takes harvested crops or animal products and uses these to produce long shelf-life food products.

It includes the **process of value addition** to produce products through methods such as preservation, addition of food additives, drying etc. with a view to preserve food substances in an effective manner, enhance their shelf life and quality.

Body

Scope of FPI in India:

- India is the world's second largest producer of fruits & vegetables after China but hardly 2% of the produce is processed.
- India is among the top 5 countries in the production of coffee, tobacco, spices, seeds etc. With such a huge raw material base, we can easily become the leading supplier of food items in the world.
- In spite of a large production base, the level of processing is low (less than 10%). Approximately 2% of fruits and vegetables, 8% marine, 35% milk, 6% poultry are processed. Lack of adequate processable varieties continues to pose a significant challenge to this sector.
- **Economic Survey 2020:** During the last 6 years ending 2017-18, Food Processing Industries sector has been growing at an average annual growth rate of around 5.06 per cent.
 - **Employment:** According to the **Annual Survey of Industries** for 2016-17, the total number of persons engaged in registered food processing sector was **54 lakhs**. (whereas unregistered FPOs supports **51.11 lakh** workers)
- **Farmer Beneficiaries:** The SAMPADA scheme is estimated to benefit about **37 lakh** farmers and generate about **5.6 lakh direct/ indirect employment** (ES 2020 data).
- **Curbing Distress Migration:** Provides employment in rural areas, hence reduces migration from rural to urban. Resolves issues of urbanization.

Government Initiatives to boost the FPI:

- The Ministry of Food Processing Industries (MoFPI) is implementing **PMKSY (Pradhan Mantri Kisan SAMPADA Yojana)**. The objective of PMKSY is to supplement agriculture, modernize processing and decrease agri-waste.
 - Mega Food Parks.
 - Integrated Cold Chain, Value Addition and Preservation Infrastructure.
 - Creation/Expansion of Food Processing/Preservation Capacities.

- Infrastructure for Agro Processing Clusters.
- Scheme for Creation of Backward and Forward Linkages.
- **Foreign Direct Investment (FDI) policy:** FDI up to 100%, under the automatic route is allowed in food processing industries.
- **Agri Export Zones:** To give thrust to export of agro products, new concept of Agri Export Zones was brought in 2001. **APEDA** has been nominated as the Nodal Agency to coordinate the efforts
 - cluster approach of identifying the potential products;
 - the geographical region in which these products are grown;
 - Adopting an end-to-end approach of **integrating the entire process** right from the stage of production till it reaches the market (farm to market).

Significance of the food processing industries:

The **Food Processing Industry (FPI)** is of enormous significance as it provides vital linkages and synergies that it promotes between the two pillars of the economy, i.e. agriculture and industry.

- **Employment Opportunities:** Food processing industries can absorb a major share of workers from the agriculture sector, who face disguised unemployment. It can lead to better productivity and GDP growth.
- **Prevents Wastage:** Nearly one-third of the food that is produced each year goes uneaten, costing the global economy **over \$940 billion** as per report by **World Resources Institute (WRI)**
 - India is biggest producer of numerous fruits and vegetable. Most of these are perishable and have very low shelf life. This is the major reason for high percentage of wastage. Their shelf life can be increased through food processing.
- **Value Addition:** Products such as tomato sauce, roasted nuts, de-hydrated fruits are in high demand.
- **Reduce malnutrition:** Processed foods when fortified with vitamins and minerals can reduce the nutritional gap in the population.
- **Boosts Trade and Earns Foreign exchange:** It is an important source of foreign exchange. For e.g. Indian Basmati rice is in great demand in Middle Eastern countries.
- **Make in India:** Food processing is one of the six superstar sectors under the GoI's, Make in India initiative and has the potential to transform India as a leading food processing destination of the World.
- **Curbing Food Inflation:** Processing increases the shelf life of the food thus keeping supplies in tune with the demand thereby controlling food-inflation.
 - **For e.g.** Frozen peas/ corn are available throughout the year.
 - Similarly, canned onions under Operation Greens can achieve price stability.
- **Doubling of farmers' income:** With contract farming, farmers can get better technological inputs from industries as well. There is income security and proportionate value for produce. They are also protected against price shocks.

- **Crop-diversification:** Food processing will require different types of inputs thus creating an incentive for the farmer to grow and diversify crops.

Impediments faced by FPI:

Food Processing Sector- Impediments

8

MOFPI
Ministry of Food Processing Industries
Government of India

Conclusion

Food processing has a promising future, provided adequate government support is there. Food is the biggest expense for an urban Indian household. About 35 % of the total consumption expenditure of households is generally spent on food. As mentioned, food processing has numerous advantages which are specific to Indian context. It has the capacity to lift millions out of undernutrition. Government has its work cut out to develop industry in a way which takes care of small scale industry along with attracting big ticket domestic and foreign investments.

Effects of liberalization on the economy, changes in industrial policy and their effects on industrial growth.

Deliberate upon the impact of the ongoing pandemic in changing dynamics of global value chain (GVC)? Suggest as to how Indian industries should behave post-pandemic situation. (250 words)

Reference: [Economic Times](https://www.economic-times.com)

Why this question:

The article talks about the impact of the ongoing pandemic in changing dynamics of global value chain (GVC) and the way forward for the Indian industries.

Key demand of the question:

Deliberate upon the impact of the ongoing pandemic in changing dynamics of global value chain (GVC) and highlight the role that Indian industries should play in the post-pandemic situation.

Directive:

Telegram: <https://t.me/insightsIAStips>

Youtube: <https://www.youtube.com/channel/UCpocbcX9GEIwaile4HLjwA>

Facebook: <https://www.facebook.com/insightsonindia>

Deliberate – Weigh up to what extent something is true. Persuade the reader of your argument by citing relevant research but also remember to point out any flaws and counter-arguments as well. Conclude by stating clearly how far you agree with the original proposition.

Structure of the answer:

Introduction:

Start by explaining the fact that the manufacturing and production ecosystem of the world is undergoing massive changes.

Body:

To start with explain that the outbreak of the COVID-19 pandemic has sent shock waves floating up and down GVCs. Unlike the previous epidemics, this public health threat is very unique, and increasingly becoming an economic threat. The hard-hit sectors in this pandemic are precision instruments, machinery, automotive and communication equipment. Present the case of Indian industries. Explain what needs to be done, suggest solutions to address the above challenges.

Conclusion:

Conclude that the reconfiguration of GVCs will be the key imperatives for businesses and policy makers in the coming future to ensure a global sustainable market.

Introduction:

Global value chains (GVCs) integrate the know-how of lead firms and suppliers of key components along stages of production and in multiple offshore locations. The international, inter-firm flow of know-how is the key distinguishing feature of GVCs.

Global Value Chains are undergoing profound changes, with important implications for the manufacturing and production ecosystem. When uncertainty rises, global value chains suffer. Based on past data, one can predict that a 300% increase in uncertainty—as the covid-19 pandemic seems likely to produce—would reduce global supply-chain activity by 35.4%.

Body:

Importance of GVCs:

- **Promote productivity and growth:** According to WTO report, a 1% increase in GVC participation is estimated to boost per capita income levels by more than 1%—about twice as much as standard trade.
- In Ethiopia, firms participating in GVC are more than twice as productive as similar firms that participate in standard trade.
- **Reduce poverty:** Since gains in growth from GVC are larger than from trade in final products, their impact on poverty reduction is also larger.
- Regions in Mexico and Vietnam that participated more intensively in GVCs experienced greater reductions in poverty.
- **Deliver better jobs:** Firms in GVC draw people into more productive manufacturing and services activities and tend to employ more women, supporting structural transformation in developing countries.
- **Important for growth:** GVCs are a powerful driver of productivity growth, job creation, and increased living standards. Countries that embrace them grow faster, import skills and technology, and boost employment.
- With GVC-driven development, countries generate growth by moving to higher-value-added tasks and by embedding more technology and know-how in all their agriculture, manufacturing, and services production.
- GVCs provide countries the opportunity to leap-frog their development process.

Impact of the ongoing pandemic in changing dynamics of global value chain:

- According to the United Nations Conference on Trade and Development (UNCTAD) estimates, published on 8 April 2020, India is among the first 15 most affected economies due to the COVID-19 pandemic.
- The disruption of world trade has a trade impact of US\$ 348 million in India due to the pandemic, although it is less compared to its developed trade partners such as EU, the US, Japan and South Korea.
- The outbreak of the COVID-19 pandemic has sent shock waves floating up and down GVCs.
- Unlike the previous epidemics, this public health threat is very unique, and increasingly becoming an economic threat.
- The hard-hit sectors in this pandemic are precision instruments, machinery, automotive and communication equipment.
- In India, these industries have started showing their participation in the GVC although facing a severe supply chain disruption due to lockdown and restrictive border controls.
- The logistic sector is breaking down and the resultant disruptions are spreading across economics.
- The businesses of small and medium enterprises, dependent on cross-border trades, have come to a standstill. This damage is irreparable.
- Higher foreign value content in export and higher domestic value content in export indicate stronger backward and forward participation in GVC. These linkages have been strongly interrupted due to lockdown.

**Measures needed for Indian industries in post-pandemic era:**

- According to the recent report published by the WTO, transparency obligations are crucial for trade in goods and services to flow. Governments are taking new trade measures every day in response to COVID-19.
- Any crisis opens new opportunities and replaces some old. Global shock helps economists and policymakers to find new pathways to grab those opportunities.
- **Short term measures:**
 - **A strong fiscal and monetary policy-mix is the need of the hour in India.**
 - The foreign content in the sectoral output of pharma industry is approximately 22%.
 - Thus, prioritising pharma industries would help in substitution for critical imported inputs by domestic ones, as there may be a large demand worldwide for these goods in the current situation.
 - This stage of the economy is an opportune moment for deficit financing.
 - In the face of large-scale unemployment and lockdown impact on livelihood of most people in India, **the deficit financing may jack up domestic demand and production.**
- **Medium to long term policy-mix measures:**
 - **ICT adoption and internet penetration, digitization, innovation and growth of e-commerce** should be prioritised in order to get the benefits of fourth industrial revolution, as **virtual platforms or 'digital supply networks'** will become more important for matching providers and users.
 - Policies such as **digital policy, AI strategy, e-commerce policy and start-up policy** are going to be instrumental to take our economy back to its growth trajectory.
 - **Brining small retailers in the e-commerce platform is imperative**, so that they can't run out from their business during the crisis.
 - Further, tackling unnecessary policy impediments to value chain operations, such as a lack of alignment of standards and other regulatory barriers, is now more important than ever to reduce the costs of international transactions.
 - After this outbreak, countries need to reengage with each other to find the silver lining, as this is a novel economic crisis that novel coronavirus has brought to us.

Conclusion:

Mitigating the impact of COVID-19 on manufacturers and supply chains requires both **new approaches and new forms of collaboration to increase overall resilience**. Therefore, there is a need of proposing a **new framework to help governments and companies** think through the implications of the ongoing transformations of Global Value Chains for their industrial development and investment strategies. Thinking of **new opportunities for multi-stakeholder collaboration for national economies** in order to advance their levels of readiness, built resilience and have a role to play in next-generation Global Value Chains.

Discuss the role of Public Sector Enterprises in the Indian Economy.(250 words)

Reference: Indian economy by Dutta and Sundaram

Why this question:

The question is straightforward and is from the static portions of paper III.

Key demand of the question:

Explain the role of public sector enterprises in India and their contributions to Indian economy.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain the scenario of public sector enterprise in India.

Body:

Explain that the public sector in India is composed of a number of segments; the govt., departmental and non-departmental enterprises. Then move on to discuss the importance/presence of the Public Sector in the Indian Economy. Discuss elaborately role of the Public Sector in the Indian Economy. Highlight the Problems Associated with Public Sector while suggesting solutions to the same.

Conclusion:

Conclude with way forward.

Introduction:

In India, a public sector company is that company in which the Union Government or State Government or any Territorial Government owns a share of 51 % or more. Currently there are just three sectors left reserved only for the government i.e. Railways, Atomic energy and explosive material. Private sectors/players are not allowed to operate in these sectors.

Body:

The public sector aims at achieving the following objectives:

- To promote rapid economic development through creation and expansion of infrastructure
- To generate financial resources for development
- To promote redistribution of income and wealth
- To create employment opportunities
- To promote balanced regional growth
- To encourage the development of small-scale and ancillary industries, and
- To accelerate export promotion and import substitution

Role of Public Sector Enterprises in the Indian Economy:

Public Sector and Capital Formation:

- The role of public sector in collecting saving and investing them during the planning ear has been very important.
- During the first and second five year plan it was 54% of the total investment, which declined to 24.6 % in the 2010-11.

Employment Generation:

- Public sector has created millions of jobs to tackle the unemployment problem in the country.

- The number of persons employed in the as on march 2011 was 150 lakh.
- Public sector has also contributed a lot towards the improvement of working and living conditions of workers by serving as a model employer.
- **Balanced Regional Development:**
 - Public sector undertakings have located their plants in backward parts of the county. These areas lacked basic industrial and civic facilities like electricity, water supply, township and manpower.
 - Public enterprises have developed these facilities thereby bringing about complete transformation in the socio-economic life of the people in these regions.
 - Steel plants of Bhilai, Rourkela and Durgapur; fertilizer factory at Sindri, are few examples of the development of backward regions by the public sector.
- **Contribution to Public Exchequer:**
 - Apart from generation of internal resources and payment of dividend, public enterprises have been making substantial contribution to the Government exchequer through payment of corporate taxes, excise duty, custom duty etc. gross internal resource generation in 1990-2000 was 36000 cr which rose to 1, 11,000 cr in 2008-09, while net profit was 92,077 cr in 2010-11.
- **Export Promotion and Foreign Exchange Earnings:**
 - Some public enterprises have done much to promote India's export. The State Trading Corporation (STC), the Minerals and Metals Trading Corporation (MMTC), Hindustan Steel Ltd., the Bharat Electronics Ltd., the Hindustan Machine Tools, etc., have done very well in export promotion.
- **Import Substitution:**
 - Some public sector enterprises were started specifically to produce goods which were formerly imported and thus to save foreign exchange.
 - The Hindustan Antibiotics Ltd., the Indian Drugs and Pharmaceuticals Ltd. (IDPL), the Oil and Natural Gas Commission (ONGC), the Indian Oil Corporation Ltd., the Bharat Electronics Ltd., etc., have saved foreign exchange by way of import substitution.
- **Promotion of Research and Development:**
 - As most of the public enterprises are engaged in high technology and heavy industries, they have undertaken research and development programmes in a big way.
 - Public sector has laid strong and wide base for self-reliance in the field of technical know-how, maintenance and operation of sophisticated industrial plants, machinery and equipment in the country.
 - Expenditure on research and development reduces the cost of production.

Despite their impressive role, Public enterprises in India suffer from **several problems and shortcomings. It includes Poor Project Planning, Over-capitalization, excessive overheads,**

overstaffing, under-utilization of the capacity, lack of proper price policy and inefficient management.

Conclusion:

The public sector in India has its set of several drawbacks and failures, but that does not underestimate the crucial role it plays in the economy as it acts as an essential catalyst to propel the economy forward regarding overall growth and development, along with the general welfare of the citizens.

Discuss the effects of Liberalization on various aspects of Indian economy and Society.
(250 words)

Reference: Indian economy by Dutta and Sundaram

Why this question:

The question is again from the static portions of GS paper III.

Key demand of the question:

The question aims to discuss the effects of Liberalization on various aspects of Indian economy and Society.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain the coming of liberalisation and its application to Indian economy.

Body:

To start with, explain the impact of liberalisation on Indian economy in general. Explain that we have seen landmark shift in Indian Economy since the adoption of new economic policy in 1991. This had far reaching impacts on all spheres of life in India. There can be no concrete conclusions about their impact on Indian people. Economic liberalization is the lessening of government regulations and restrictions in an economy in exchange for greater participation by private entities; the doctrine is associated with classical liberalism. Thus, liberalization in short is “the removal of controls” in order to encourage economic development. Discuss its impact on various sectors of economy – agriculture, industry, health, education, IT etc. Explain how it impacted the fabric of Indian society; highlight both positives and negatives.

Conclusion:

Conclude with significance.

Introduction:

Economic liberalization is the lessening of government regulations and restrictions in an economy in exchange for greater participation by private entities; the doctrine is associated with classical liberalism. Thus, liberalization in short is “the removal of controls” in order to encourage economic development.

After suffering a huge financial and economic crisis our previous Government brought a new policy which is known as **Liberalization, Privatization and Globalization Policy (LPG Policy)** also known as **New Economic Policy, 1991** as it was a measure to come out of the crisis that was going on at that time.

Body:

Impact on Indian Economy:

- India's annual average growth rate from 1990 – 2010 has been 6.6 % which is almost double than pre reforms era.
- **Free flow of capital:** Liberalisation has improved flow of capital into the country which makes it inexpensive for the companies to access capital from investors. Lower cost of capital enables to undertake lucrative projects which they may not have been possible with a higher cost of capital pre-liberalisation, leading to higher growth rates.
- **Stock Market Performance:** Generally, when a country relaxes its laws, taxes, the stock market values also rise. Stock Markets are platforms on which Corporate Securities can be traded in real time.
- **Political Risks Reduced:** Liberalisation policies in the country lessens political risks to investors. The government can attract more foreign investment through liberalisation of economic policies. These are the areas that support and foster a readiness to do business in the country such as a strong legal foundation to settle disputes, fair and enforceable laws.
- **Diversification for Investors:** In a liberalised economy, Investors gets benefit by being able to invest a portion of their portfolio into a diversifying asset class.

Impact on Agriculture:

- In the area of agriculture, the cropping patterns has undergone a huge modification, but the impact of liberalisation cannot be properly measured. It is observed that there are still all-pervasive government controls and interventions starting from production to distribution for the produce.
- Global agricultural economy is highly distorted. This is mainly because imbalance in economic and political power in hands of farmers of developed and developing countries. In developed countries, commercial and capitalistic agriculture is in place which is owned by influential Agri corporations. They easily influence policies of WTO and extract a better deal for themselves at cost of farmers of developing world.
- Farming in developing world is subsistence and supports large number of poor people. With globalization there has been high fluctuation in commodity prices which put them in massive risk. This is particularly true for cash crops like Cotton and Sugarcane. Recent crises in both crops indicate towards this conclusively.
- Another global debate born out of globalization is one of GM crops. Here too powerful MNCs like Monsanto hold the key. USA allows unhindered use of GM crops, but EU bans it. In India only non-food GM crops are grown.
- Apart from these, Farm Mechanization i.e. use of electronic/solar pumps, Tractors, combines etc. all are fruits of globalization. Now moving a step further, Information technology is being incorporated into agriculture to facilitate farming.

Impact on Small scale industry

- SSIs however exists and still remains backbone of Indian Economy. It contributes to major portion of exports and private sector employment.
- Results are mixed, many erstwhile Small scale industries got bigger and better.
- But overall value addition, product innovation and technology adoption remains dismal and they exist only on back of government support.
- Their products are contested by cheaper imports from China.

Impact on Services Sector:

- In service sector, globalization has changed the scene of developing countries and misery for developed ones.
- Due to historic economic inequality between two groups, human resources have been much cheaper in developing economies.
- This was further aided by information technology revolution and this all culminated in migration of numerous jobs from developed countries to developing countries.
- Best part is that export of services result in export of high value. There is almost no material exported which consume some natural resource. Only thing exported is labour of Professionals, which does not reduce, instead grows with time.
- Now India is better positioned to become actually Knowledge Economy. Exports of these services generate huge revenue for India's foreign Exchange.

Impact on Education and Health Sectors:

- It should be noted that food (Agriculture), Health and education (and to lesser extent banking) are among basic necessities, which every human being deserves and can't do without.
- Unfortunately, in developing countries there is market failure in all these sectors and majority of people can't afford beyond a certain limit (or can't afford at all).
- Concept of free markets, globalization, liberalization etc. fails here miserably.
- Free markets provide goods and services to people who can afford paying for them, not to those who deserve and need these.
- Now if we consider these sectors from angle of our inclination towards free markets, certainly there has been lot of progress.
- There has been world class education available in India and Deregulation has resulted in Mushrooming of private engineering and Medical Colleges.
- But in reality, this had far reaching devastating effect on society. These new colleges accommodate only a miniscule proportion of aspirants at very high costs.
- Reality is that after deregulation and liberalization, government along with other sectors, pulled its hand from social sectors too. Now there is Mediocre to high quality options are available in private sector which can be availed as per one's budget.

Overall negative impacts of liberalization:

- **Impact of FDI in Banking sector:** Foreign direct investment allowed in the banking and insurance sectors resulted in decline of government's stake in banks and insurance firms.
- **Destabilization of the economy:** Tremendous redistribution of economic power and political power leads to Destabilizing effects on the entire Indian economy.
- **Threat from Multinationals:** Prior to 1991 MNC's did not play much role in the Indian economy. In the pre-reform period, there was domination of public enterprises in the economy. On account of liberalisation, competition has increased for the Indian firms. Multinationals are quite big and operate in several countries which has turned out a threat to local Indian Firms.
- **Technological Impact:** Rapid increase in technology forces many enterprises and small scale industries in India to either adapt to changes or close their businesses.
- **Mergers and Acquisitions:** Acquisitions and mergers are increasing day-by-day. In cases where small companies are being merged by big companies, the employees of the small companies may require exhaustive re-skilling. Re-skilling duration will lead to non-productivity and would cast a burden on the capital of the company.

Conclusion:

It is well recognized that liberalization has major impact on the Indian economy and made it a huge consumer market. Currently, most of the economic changes in the country are based on the demand supply cycle and other economic factors. Today, India has made good status in economy in terms of market exchange rate and 5th largest in terms of the purchasing power parity. Economic liberalization is generally thought of as a useful and necessary process for developing nations. The fundamental goal is to have clear capital flowing into and out of the country in order to increase growth and efficiencies within the domestic country. The effects following liberalization are what should interest investors as it can provide new opportunities for diversification and profit.

Infrastructure: Energy, Ports, Roads, Airports, Railways etc.

Deliberate on the problems in railway infrastructure in the country and also discuss the efforts of the government to resolve the issues in this direction.(250 words)

Reference: [Business Today](#)

Why this question:

The question is straightforward and is based on topics from the static portions of GS paper III.

Key demand of the question:

One has to discuss the problems in railway infrastructure in the country and the efforts of the government to resolve the issues in this direction.

Directive:

Deliberate – Weigh up to what extent something is true. Persuade the reader of your argument by citing relevant research but also remember to point out any flaws and counter-arguments as well. Conclude by stating clearly how far you agree with the original proposition.

Structure of the answer:

Introduction:

One can start by presenting some key facts highlighting the expanse of the railway infrastructure.

Body:

List down the key problems – The quality of service provided leaves scope for substantial improvement in many areas. The average speed of trains is much lower than in other comparable countries. Railway safety is also an issue. The entire system is in urgent need of modernization. The Rolling stock must be modernized and new. Higher capacity locomotives inducted. Average speeds must be significantly increased etc. Discuss and list down some of the efforts of the government aimed at resolving these problems.

Conclusion:

Conclude with a positive note and highlight the significance of railways as a critical transport infrastructure.

Introduction

Indian Railways (IR) has the fourth-largest rail network in the world, behind only the US, China and Russia. It is a network of 70,000km, spanning 29 states, three Union territories and 8,500 stations. It runs about 21,000 trains, two-thirds of which are passenger trains, carrying 23 million passengers and 3 million tonnes of freight per day.

This calls for a re-look into the challenges of the Indian Railways and the restructuring needed.

Body

Problems in Railway Infrastructure

- **Low Quality of Service, Catering and Punctuality:** Indian Railways deserves the credit for serving the largest democracy in the world, but it faces criticism, particularly in case of aspects like service, catering, and punctuality.
 - CAG report noted that, at present the focus is mainly on improving the façade and passenger facilities, rather than removing bottlenecks to ensure timely movement of trains.
 - The rolling stock is in need of upgradation, on par with the European nations.
- **Low Internal Revenue:** The problem of cross-subsidization has severely affected the internal revenue generation of the Indian Railways.
 - **Cross subsidization:** Money earned through freight traffic is diverted to meet the shortfalls in passenger revenue, and thus the development of freight traffic infrastructure suffers.
- **Lack of fiscal space:** The working of Indian Railways is caught up between making it a self-sufficient organisation and serving it as a transport system for the poor.
 - The result being no rise in passenger fares and new trains and routes being decided on non-commercial reasons.
 - The passenger **fares usually remain static for years**, burdening the Union Budget.
 - In order to keep finances in check, **freight charges have been raised** in the past.
 - But the discrepancy between freight charges and passenger fares seem to distort the Railways' performance.
 - The recent decision of surge pricing of tickets in premium trains is a move in a correct direction.
- **Operating Efficiency:** Indian railways has a huge employee base of 1.3 million, which includes powerful workers' unions.
 - Operating ratio of Railways is at nearly 99%, meaning there is no revenue left for making improvements.
- **Increasing Number of Accidents:** Repeated railway accidents have further raised questions on government ownership of railways.
- **General Inefficiencies:** In the previous fiscal, it missed most of its targets, including of electrification, track renewals, bridge works, and doubling of tracks.
 - In 2014/15, projects worth Rs 6.5 lakh crore were stuck, including works related to doubling, new lines, gauge conversion, traffic facilities, and electrification.
 - Today Railways faces a burden of Rs 4,83,511 crore for the execution of 458 unfinished projects.

Efforts of the government

- **Mission Raftaar** is an Indian Railway's project, to increase the speed of trains on busy routes, to reduce travel time.

- It was introduced in the Railway Budget of 2016-17 and approved by NITI Aayog in 2017.
- It aims to offer semi-high-speed trains to passengers, by running trains at a speed of 160-200 km/h in the selected corridors of the country.
- This will increase the ridership and reliability while improving the tourism prospects.
- **Vande Bharat Express:** India entered a new era of mobility with Vande Bharat Express.
 - India's first **high-tech, energy-efficient, self-propelled train**.
 - This is a prime example of the **success of Make in India movement**.
 - This train will be proliferated across India and also exported globally.
- **High Speed Rail:** The Ahmedabad-Mumbai High-speed Rail (HSR) will revolutionise the transport sector in India through speed, safety and service.
- **Freight:** Railways has achieved significant milestones in moving the country's economy faster with the highest ever freight loading in 2018-19.
 - **Freight earnings** have touched their **highest level** and is expected to be about Rs. 1.43 lakh cr in BE 2019-20.
 - **Dedicated Freight Corridors (DFC)** are gateways to India's superfast growth and development. First sections of Eastern DFC (Bhadan to Khurja, 200 Kms) and Western DFC (Rewari to Madar, 200 Kms) have been completed.
- **Modernization and upgradation:** Railways is improving passenger services including a complete **makeover of Stations by installing modern facilities** including **escalators, lifts, free wifi etc.** and using local art in the design.
 - Four stations are undergoing redevelopment - Habibganj, Gandhinagar, Charbagh and Gomtinagar.
 - Beautification of 65 stations has been completed using local art.
 - Railways has improved trains and coaches including launching the **Tejas, Antyodaya and Humsafar trains and Deen Dayalu and Anubhuti coaches**.
 - Connecting passengers to the **digital world, high speed WiFi service** has been provided at more than 800 stations.
 - Pan India rollout of **paperless Unreserved Ticketing (UTS)** has been done to make ticketing convenient and hassle free.
- **Mission Satyanishta:** It aims at sensitizing all railway employees about the need to adhere to good ethics and to maintain high standards of integrity at work. It is the first ever such mission by any government organisation.

Way-Forward

Bibek Debroy Committee made following recommendations for reforming the railways in India.

- **Need for Modernisation:** It is important to modernize the railways, so measures must be taken to reimburse the social costs speedily so that resources of the railways is better allocated and facilities are upgraded from time to time.
- **Delegation of functions:** The peripheral function of railways (**cleanliness, ticket disposal, traveller's amenities**), **must be privatized.**
- **Transition to commercial accounting:** The process of accounting in Indian Railways is very complicated.
 - The financial statements of Indian Railways need to be re-drawn, consistent with principles and norms nationally and internationally accepted.
- **The non-core function of railways must be privatized:** These activities include running hospitals and schools, catering, real estate development, including housing, construction and maintenance of infrastructure, manufacturing locomotives, coaches, wagons and their parts.
- **Expansion of Indian Railways Manufacturing Company:** According to Debroy, wagons are already produced by the private sector. Coaches and locomotives could follow. Unless they are freed from 59 their constraints, the existing production units will be unable to face this competition.
- **Encouraging private entry:** Private entry into running both freight and passenger trains in competition with Indian railways should be allowed and private participation.
- **Independent regulator:** Shift regulatory responsibility from the government to an independent regulator as the private sector will only come in if there is fair and open access to railway infrastructure.

Discuss the objectives of the National Electric Mobility Mission Plan (NEMMP) 2020, and the focus areas of FAME India Scheme.(250 words)

Reference: dhi.nic.in

Why this question:

The question is based on the National Electric Mobility Mission Plan (NEMMP) 2020.

Key demand of the question:

One must evaluate the National Electric Mobility Mission Plan (NEMMP) 2020, its objectives and the focus areas of FAME India scheme in detail.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

The National Electric Mobility Mission Plan (NEMMP) 2020 is a National Mission document providing the vision and the roadmap for the faster adoption of electric vehicles and their manufacturing in the country.

Body:

Explain the key features, objectives of the NEMMP 2020. Highlight the advantages and disadvantages. Talk about the FAME Scheme –The target is to achieve sales of 6 – 7 million in the hybrid and electric vehicles sector from 2020. The government will provide fiscal and monetary

incentives for this industry. The expectation is that crude oil worth Rs.62000 crore will be saved due to this.

Conclusion:

Conclude with importance.

Introduction

There is an ambitious target under National Electric Mobility Mission Plan **to achieve** 6-7 million sales of hybrid and electric vehicles year on year from 2020 onwards. Government aims to provide fiscal and monetary incentives to kick start this nascent technology. With the support from the Government, the cumulative sale is expected to reach 15-16 Million by 2020

Body

Objectives of National Electric Mobility Mission Plan

- To encourage reliable, affordable and efficient hybrid and electric vehicles that meet consumer performance and price expectations.
- **Government-Industry collaboration** for promotion and development of indigenous manufacturing capabilities in hybrid and electric vehicles, required infrastructure, consumer awareness and technology;
- **Energy Security:** Helping India to emerge as a leader in the electric vehicle Two-Wheeler and Four-Wheeler market in the world by 2020, with total EV sales of 6-7 million units thus enabling Indian automotive Industry to achieve global EV manufacturing leadership and contributing towards **National Fuel Security**.
- **Environment Conservation:** Mitigation of the adverse impact of vehicles on the environment.
 - According to NITI Aayog (2019), if India reaches an EV sales penetration of 30 per cent for private cars, 70 per cent for commercial cars, 40 per cent for buses, and 80 per cent for 2 and 3 wheelers by 2030, **a saving of 846 million tons of net CO₂** emissions and oil savings of 474 MTOE can be achieved.
- **Indian Manufacturing Capabilities:** Growth of domestic manufacturing capabilities in the automobile sector. Economic Survey 2019 had noted that India could become the Detroit of Electric Vehicles.

Focus areas for Faster Adoption and Manufacturing of Electric vehicles (FAME) scheme

The scheme was launched to fast-track the goals of NEMMP.

- In FAME India Phase II, launched from 1 April 2019, emphasis is on electrification of public transportation.
- **Electrification of the public & shared transport:** It is planned to support 10 Lakhs e-2W (electric – 2-Wheeler), 5 Lakhs e-3W, 55000 4Ws and 7000 Buses.
- Demand incentives on operational expenditure mode for electric buses will be delivered through State/city transport corporation (STUs).
- **Incentives will be given** to 3-wheeler/4 wheeler vehicles used for public transport or registered for commercial purposes.

- **Charging infrastructure:** About **2700 charging stations** will be established in **metros, million plus cities, smart cities** and cities of hilly states across the country.

Way Forward

There is a strong believe that **electric infrastructure** will have a massive scale going forward.

- For EVs to contribute effectively, we need commensurate efforts in developing an entire ecosystem.
 - Need to shift the focus from subsidizing vehicles to subsidizing batteries because batteries make up 50% of EV costs.
 - Work places in tech parks, Public bus depots, and Multiplexes are the potential places where charging points could be installed. In Bangalore, some malls have charging points in parking lots.
 - Corporates could **invest in charging stations** as **Corporate Social Responsibility compliances**.
- **SIAM** (Society of Indian Automobile Manufacturers) the nodal body for Indian automobile industry reports that the country currently sells close to 750,000 electric vehicles a year, a majority of these are two wheelers, which sold 6,30,000 units, with 1,26,000 of these three-wheelers.
- A **longer-term policy** priority has to be the **setting up of lithium battery production and solar charging infrastructure** of a scale that matches the ambition. The Centre has accepted some of the demands of the auto industry to popularize EVs.
- The government should provide **incentives for CNG vehicles** and should also come out with a **scrappage plan for vehicles** to incentivize customers to buy new vehicles.

Conclusion

While various incentives have been provided by the government and new policies are being implemented, it is important that these policies not only focus on reducing the upfront costs of owning an EV but also reduce the overall lifetime costs of ownership.

Science and Technology- developments and their applications and effects in everyday life; Achievements of Indians in science & technology; indigenization of technology and developing new technology.

Covid-19 responses show need to revisit India's drone policy, do you think our drone policy is in tune with the emerging scenario? Give your opinion with suitable justifications. (250 words)

References: [Economic Times](#)

Introduction:

Villages, cities and even entire countries are locked down because of the Covid-19 pandemic, exposing big holes in local supply chains and in how governments access people across dense urban clusters and remote village areas. Incidentally, as it often happens in emergencies, it also uncovered

our ingenuity in finding new and useful applications for available things and technologies. Like, how we use unmanned aerial vehicles (UAV), commonly called drones.

The Director General of Civil Aviation has finally announced its policy for remotely piloted aircraft or drones, which came into effect from December 1, 2018. The new policy defined what will be classified as remotely piloted aircraft, how they can be flown and the restrictions they will have to operate under.

Body:

Usage of drones in times of COVID-19 pandemic:

- Pictures and news reports from the world over showed authorities putting drones to a variety of uses while tackling the pandemic.
- They were used for surveillance and monitoring during lockdowns, for broadcasting important messages, for tracking down violators of restrictions, for decontamination of hotspots, for delivery of medicines and some essential items.
- Right now, a Chennai-based company is using drones to disinfect areas specified by the Chhattisgarh government.
- The police in Spain and in some Indian states are using drones with attached sirens and loudspeakers to warn residents to stay home.
- China used drones for transporting medical equipment to contagious areas with minimal risk.

Extra information: Drone policy details:

Who can fly?

- *The policy also stipulates that RPAs shall be flown only by someone over 18 years of age, having passed 10th exam in English, and undergone ground/ practical training as approved by DGCA.*
- *Under the new framework, civilian users seeking UIN/UAOP have to be Indian citizens.*
- *Companies seeking permits for commercial use must be registered in India, with two-thirds of the board members, including the chairman, being Indian nationals. Their primary place of business must be India and "substantial ownership" and this has not been defined must be resting with Indian nationals.*
- ***The basic operating procedure will restrict drone flights to the daytime only and that too within Visual Line of Sight (VLOS). This applies to all categories.***
- ***Also, along with other SOPs, the DGCA has clarified that no remote pilot can operate more than one RPA at any time. Manned aircraft will also get priority. There can't be any human or animal payloads, or anything hazardous. It cannot in any manner cause danger to people or property. An insurance will be mandatory to cover third-party damage.***

Where can drones not be flown?

- *RPAs cannot be flown within 5km of the perimeters of the airports in Mumbai, Delhi, Chennai, Kolkata, Bengaluru and Hyderabad and within 3km from the perimeter of any other airport.*
- *It cannot fly within permanent or temporary Prohibited, Restricted and Danger Areas and within 25km from international border which includes the Line of Control (LoC), Line of Actual Control (LAC) and Actual Ground Position Line (AGPL).*
- *It cannot fly beyond 500 m into sea from the coast line and within 3 km from perimeter of military installations.*
- *It also cannot be operated from a mobile platform such as a moving vehicle, ship or aircraft.*

- *Eco-sensitive zones around National Parks and Wildlife Sanctuaries are off-limits without prior permission.*
- *Violations will be acted on under relevant sections of the IPC and the Aircraft Act 1934.*

Need to align the drone policy in tune with changing times:

- There is a need to introduce a few changes for faster adoption of drone technology by government agencies providing emergency services.
- For instance, to deploy drones at present, government agencies like the fire department, police and NDMA need to take permission from the DGCA and AAI 24 hours in advance under the no permission no take-off (NPNT) regulation.
- If the emergency necessitates a faster response and cannot be predicted, these agencies should be exempt from NPNT.
- The security risk here is addressed because the agencies are mostly state bodies themselves or are at least aiding the government for public good.
- Hence misuse by rogue operators is out of question.

Way forward:

- Going forward, drones could be integrated into emergency response mechanisms called “cobotic responses”.
- These are responses in which humans cooperate with robots (effectively drones are robots).
- This could be the future, and even the new normal, and may even open up several possibilities.
- Imagine being able to go to the site of a nuclear accident like that in Fukushima with a drone capable of detection and resolution.
- India must also examine prevailing policy mechanisms in other countries to adopt their best practices as it formalises its regulatory framework. However, a point to be underlined is that guidelines alone are not sufficient so the key is ensuring implementation and compliance.
- Flying drones safely in India will require research and development to understand how they can be best used in India’s unique landscape.
- The government needs to create the right ecosystem for drone operations to add to the economy’s automation dividend.

Discuss the possible role that AI can play in revolutionizing the mining sector in India in near future. (250 words)

Reference: [geography and you](#)

Why this question:

The question is based on the application of AI to the mining sector in the country.

Key demand of the question:

Explain the prospects of AI applications in revolutionizing the mining sector.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain key facts of mining sector.

Body:

To start with, explain what role AI can play in aiding the mining sector in the country. List out the existing challenges facing the mining sector that AI can resolve. Give examples specifically evident of the lacunae in the mining sector.

Conclusion:

Conclude that AI can be the future enabler of mining.

Introduction:

Artificial intelligence (AI) is the branch of computer science concerned with making computers behave like humans. AI refers to the ability of machines to perform cognitive tasks like thinking, perceiving, learning, problem solving and decision

Artificial Intelligence (AI) brings in a host of real-world applications which had earlier merely been a subject of science fiction novels or movies. The breakthroughs such as the Weather Company's to be launched, **the GRAF model** capable of predicting a thunderstorm virtually anywhere on the planet every hour and other such applications are useful. AI has made inroads to automation and decision support systems to complement or augment human abilities.

Body:

Artificial intelligence is helping to transform the mining industry into a safer, more profitable, and more environmentally friendly industry.

Leveraging AI in mining:

- **Mineral exploration**
 - AI is leading to earlier identification for mining companies, which can eliminate time and money spent on wasted exploration as well as increasing discovery potential.
 - Through the use of pattern matching, predictive analytics, and even computer vision systems that can process map and geological data AI is able to analyze vast quantities of data to better predict where to find better resources.
 - With better predictions comes better planning and a better return on investment.
 - The latest mineral exploration technologies have led to more efficient and targeted drilling campaigns, as well as world class discoveries.
- **Drones:**
 - Drones are increasingly being used in the mining industry, becoming a very powerful tool for a wide range of applications.
 - Companies are using drones to scan over their mining operations, keeping an eye on quarry and waste piles, environmental issues, retention and leaching ponds, and pipeline infrastructure.
 - Using machine learning-based computer vision systems, these drones can analyze data collected from the imagery.
 - This gives mining companies continuous, around-the-clock access and monitoring to their facilities in ways not possible with human operation.
- **Autonomous vehicles, trains, aircraft and mines:**

- Mines have always been dangerous places to work. However, to extract the resources we need, we're moving to increasingly more hostile environments to get them.
 - Whether we're extracting coal or minerals miles under the earth, or oil and gas from deep sea drills, or excavating land in arctic zones, we're increasingly putting people into harsh environments.
 - It is much more preferable to put machines and equipment into mines and greatly minimize or eliminate human labor from these harsh conditions.
 - Through the use of AI-powered autonomous systems, mining and energy companies are making greater use of self-controlling machines in harsh environments. This equipment is then able to work without the presence of a human. It is also capable of going to many places that humans just can't physically go.
 - This includes using the most advanced airborne electromagnetic technology, collecting high resolution electromagnetic, magnetic and radiometric data from an autonomous aircraft.
 - This can simultaneously map shallow and deep features at a higher level of resolution than previously possible, enabling them to develop an understanding of an area's geology and fully analyse it before drilling any unnecessary deep holes.
 - Autonomous mining equipment is set to increase overall productivity.
 - In addition, these machines are able to work around the clock without tiring while also minimizing costly and potentially fatal mistakes.
 - Another aspect of these autonomous machines is that they can perform some of the regular inspections needed on the mines.
 - By attaching cameras and sensors to the equipment companies can detect issues in the mine such as gas levels and structural instability. The more frequently that mines can be inspected and the less we need to send human inspectors into a mine, the safer the mining operation is.
- **Reducing environmental impact with AI**
 - Mining by its nature is destructive and has a negative environmental impact. While it isn't possible to completely eliminate the negative environmental impact of mining, it is possible to significantly reduce this impact by managing how resources are extracted, transported, and treated.
 - Cameras and sensors are being deployed around mines, both on the inside and outside to have constant surveillance.
 - These devices are able to monitor excavation, extraction, and general mining activities, keeping tabs on the spread of waste and harmful materials.
 - **Safety and maintenance**
 - Aside from cost savings, AI uses real-time data and analytics to help mining companies prevent accidents and injuries on the job.
 - If enough high-quality data can be collected, the applied technology should be able to predict failures transforming preventative maintenance into predictive maintenance.

Conclusion:

It is clear that the use of robotics, AI and machine learning can significantly help save costs, increase efficiency, improve safety, increase discovery potential and many other benefits for mining companies. What has held them back was the data challenge, as being able to extract and make actionable insights from a large amount of data has often been too difficult. However, mining companies are now working on scaling the use of AI in mining and we will start to see more sophisticated use of AI in the mining industry.

Discuss the problems and prospects of Hyperloop as fifth mode of transportation.(250 words)

Reference: [Live Mint](#)

Why this question:

The question is based on the applications of technology to effect everyday life.

Key demand of the question:

Explain the problems and prospects of Hyperloop as fifth mode of transportation.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain what you understand by Hyperloop.

Body:

A Hyperloop is a proposed mode of passenger and/or freight transportation which has a sealed tube or system of tubes through which a pod may travel free of air resistance or friction conveying people or objects at high speed while being very efficient. The idea was first mooted by Elon Musk, CEO of SpaceX and Tesla, who gave a white paper on it in the year 2013. Discuss then what the expected benefits in detail are. Explain and elucidate upon the possible challenges involved in realizing the goal of making it the fifth mode of transport.

Conclusion:

With the rising population and increasing congestion, Transport Oriented Development (TOD) is the need of the hour in which Hyperloop like transportation can play a major role. However, much is needed to be done before it can become a reality.

Introduction:

Hyperloop technology is a transportation system where a pod-like vehicle is propelled through a near-vacuum tube connecting cities at speeds matching that of an aircraft. The hyperloop concept is a brainchild of Tesla founder Elon Musk. "It is based on vactrain concept which employs magnetically levitating trains in the form of capsules in the evacuated (airless) or partly evacuated tubes. India's first Hyperloop project is coming up in the state of Andhra Pradesh. Elon Musk's revolutionary transport idea

will be connecting the city centres, Vijayawada and Amaravati.

Body:

Travelling in a Tube

THE TECHNOLOGY

A capsule, with passengers, travels at speeds of more than **1200 KM/H** inside a vacuum tube

Vacuum tube has an area of **LOW PRESSURE INSIDE IT**

INDIA PLANS

Hyperloop can be built in India in **38 MONTHS**

Globally, **800 ENGINEERS** working on the Hyperloop, of which **25 ARE FROM INDIA**

It uses power from **RENEWABLE ENERGY** sources like solar energy, regenerative braking & wind power

These tubes stand on pylons that can **WITHSTAND** quakes & crashes

Operation:

- In hyperloop transportation, custom-designed capsules or pods are expected to zip smoothly through continuous steel tubes which are held at partial vacuum.
- The pod which sandwiches the passenger compartment between an air compressor upfront and a battery compartment in the rear is supported by air caster skis at the bottom.
- The skis float on a thin layer of air provided under high pressure, eliminating rolling resistance and allowing for movement of the pods at high speeds.
- These capsules are expected to be driverless with estimated speeds of 1,000 km/h. Linear induction motors that are placed along the tube control the speed of the pod. Electronically-assisted acceleration and braking determines the speed of the capsule.
- This speed is more than two and a half times the top speed of the world's fastest train, the Shanghai Maglev (267 mph or 430 km/h), and some 200 mph faster than the cruising speed of a commercial jetliner (460-575 mph/740-925 km/h).

Prospects:

- A major advantage of the hyperloop tube concept is its potential for extremely efficient transportation on a large scale.
- The technology offers very fast speed of transportation which is twice that of aircraft.
- The hyperloop can be powered mostly or entirely by renewable energy. If powered entirely by solar and wind power, the net emissions of the hyperloop are practically zero.
- It has very low power consumption.
- It is low cost transportation system on long run. Compared to high-speed rail travel, Hyperloops potentially need far less ground space to construct their tunnels and far less energy to transport the pods than conventional trains.
- It is resistant to earthquakes.

- It is safe mode of transportation system.
- It has smaller civil engineering footprint, with no direct emissions or noise compared to railways

Challenges:

- Constructing tube hundreds of kilometers long would be an engineering marvel in of itself. However, introducing tube hundreds of kilometers long that operates at a near perfect vacuum which can support the force of capsule weighing thousands of kilograms as it travels hundreds of kilometers an hour is nothing short of sci-fi fantasy.
- Small scale experiments reveal the fundamentals of the idea are sound. Although, in the real world, there are tens of thousands of kilograms of atmospheric pressure which threatens to crush any vacuum chamber.
- There is also the problem with thermal expansion which threatens to buckle any large structure without proper thermal expansion capabilities.
- The Hyperloop would also be stupendously expensive. There are many unavoidable problems facing the Hyperloop that threaten the structural integrity, and every human life on board. The problems can be addressed, but at a great cost.
- Initial cost of investment to have the system in place is very high.
- Land use rights will be concern for deployment of the project.
- It has very high risk to life when something wrong happens to the system.
- It has limited space in the train and hence people cannot move freely.

Conclusion:

The technology is nascent as no hyperloop has actually been developed on a long distance. India has time to develop expertise in the field. Partnerships with companies like HTT and Virgin Hyperloop will help India decide as to how the technology can be cost effective. Also, meanwhile improving basic necessities like food, access to energy and house should be focused.

What are the biggest challenges facing online education today? How do you overcome challenges in online learning?(250 words)

Reference: [Indian Express](#)

Why this question:

The article talks about Indian education sector switching gears to the online education system amidst the Covid times.

Key demand of the question:

One has to evaluate the challenges facing the e-learning aspects of education in India today and what solutions need to be figured out to address the same.

Structure of the answer:**Introduction:**

Briefly explain the current scenario of education across the world.

Body:

To start with, explain that It shouldn't have taken a global pandemic for Indian education to explore online teaching and learning. Challenges lie ahead. Explain that Comparing face-to-face learning with online learning brings forth significant deficiencies in the online mode such as lack

of human connect, absence of opportunities of collaborative learning, teacher supervision and the most glaring being lack of opportunities for hands-on learning in complex subjects such as science.

Conclusion:

Conclude by suggesting solutions to address these key concerns.

Introduction:

The coronavirus pandemic has shuttered educational institutions across the globe. Closure of schools, colleges and universities, shutdown of routine life of students and teachers, disruptions in education and the education ministry remaining incommunicado, have created an unprecedented situation and thrown many unexpected challenges to administrators, educators, teachers, parents and students.

Body:

Impacts on education due to COVID-19 pandemic:

- school and university closures will not only have a short-term impact on the continuity of learning for more than 285 million young learners in India but also engender far-reaching economic and societal consequences.
- The pandemic has significantly disrupted the higher education sector as well, which is a critical determinant of a country's economic future.
- A large number of Indian students—second only to China—enroll in universities abroad, especially in countries worst affected by the pandemic, the US, UK, Australia and China.
- Many such students have now been barred from leaving these countries. If the situation persists, in the long run, a decline in the demand for international higher education is expected.
- The bigger concern, however, on everybody's mind is the effect of the disease on the employment rate. Recent graduates in India are fearing withdrawal of job offers from corporates because of the current situation.
- The Centre for Monitoring Indian Economy's estimates on unemployment shot up from 8.4% in mid-March to 23% in early April and the urban unemployment rate to 30.9%.

Challenges:

- India is far behind some developing countries where digital education is getting increased attention.
- In countries where e-learning is popular, students have access to various online resources such as Massive Open Online Courses (MOOCs) which help students, teachers and professionals upgrade their skills.
- The major challenge in EdTech reforms at the national level is the seamless integration of technology in the present Indian education system, which is the most diverse and largest in the world with more than 15 lakh schools and 50,000 higher education institutions.
- Further, it is also important to establish quality assurance mechanisms and quality benchmark for online learning developed and offered by India HEIs as well as e-learning platforms (growing rapidly).
- Many e-learning players offer multiple courses on the same subjects with different levels of certifications, methodology and assessment parameters. So, the quality of courses may differ across different e-learning platforms.

- Democratization of technology is now an important issue, comprising internet connectivity, telecom infrastructure, affordability of online system, availability of laptop/desktop, software, educational tools, online assessment tools, etc.
- Since our education system has not trained our teachers and students to think creatively and manage in a crisis situation, and has underplayed the importance of e-learning, they are unprepared for the transition from the classroom to online.
- Parents feel too pressed, having to support their children's classes while working from home themselves.
- The physical classroom does not only impart the syllabus. Children are also socialised, and there is an element of sport and play which is absent in virtual learning.
- The matrix for socialisation is not replicated on an LCD screen.
- Poor are disconnected and irrespective of background, some children cannot relate to the online classroom, and many more are losing out on midday meals.

Measures needed:

- There should be ease of digital access and the ability of parents to support learning at home.
- Online classes offered as live teaching can be sustained only with a mix of activities, worksheets and interactive sessions.
- Teachers should have a structured plan which does not suffocate or burden them and also keep the students involved.
- All institutions will have to chalk out an infrastructure plan which can be used in such a crisis.
- Teachers need to be considerate about how children feel or what they are going through these days so an understanding should be developed.

Going forward, the use of technology in teaching or recruitment will lead to a new era wherein the best of faculty will be available from across the globe to students. Education quality will be gauged not just by the quality of faculty but will also have quality of IT infrastructure and familiarization of the faculty with digital teaching technologies as important parameters.

Conclusion:

To summarize, education must continue. Students should keep learning. The lockdown period should be productive. Educators should think creatively and introduce innovative ways of learning. In a country where access to the Internet and high-speed connectivity is a problem, and the digital divide is an issue, it is important to address the challenges. Those who are involved in education planning and administration should give a serious thought to reducing the digital divide in the country and popularize digital learning.

Cloud applications have become a necessity for business continuity in today's world, do you agree? Comment.(250 words)

Reference: [Financial Express](#)

Why this question:

The article talks about ever rising use of cloud applications to all the business communities.

Key demand of the question:

Explain the importance of cloud applications in today's world with special focus on their importance to business communities.

Directive:

Comment— here we have to express our knowledge and understanding of the issue and form an overall opinion thereupon.

Structure of the answer:

**Introduction:**

Start by explaining what cloud applications are.

Body:

Cloud computing is the on-demand availability of computer system resources, especially data storage (cloud storage) and computing power, without direct active management by the user. Today it has become more important than ever for the organisations to have a strong foundation in place for their business systems as there are challenges pertaining to business continuity, cash-flow, and supply-chain. Explain why it has become essential to the Businesses of today.

Conclusion:

Conclude by reasserting the significance of such a technology.

Introduction:

Cloud computing is the delivery of computing services—including servers, storage, databases, networking, software, analytics, and intelligence—over the Internet (“the cloud”) to offer faster innovation, flexible resources, and economies of scale.

Body:

In general, there are three cloud computing characteristics that are common among all cloud-computing vendors:

- The back-end of the application (especially hardware) is completely managed by a cloud vendor.
- A user only pays for services used (memory, processing time and bandwidth, etc.).
- Services are scalable

It is common to categorize cloud computing services as infrastructure as a service (IaaS), platform as a service (PaaS) or software as a service (SaaS)

Cloud computing in today's times:

- Due to the covid-19 pandemic, many companies have asked their employees to work remotely.
- This change has brought new ways of working digitally and some teams have experienced an easier transition than others with the help of cloud technology that is automating their business processes and allowing them to better cope with closing the books, remotely.
- In times like these, it is important that businesses continue to innovate and pivot in order to achieve their business goals.
- Managing core processes and customer experience data on a single platform helps create operational efficiency, improves insights, enhances decision-making and enables businesses to be nimble and outpace market changes.
- A modern suite of software as a service (SaaS) applications provides a complete, agile, secure, and integrated solution for an entire business, across functions.
- Highly customized, on-premises solutions are siloed and often require multiyear deployments lack the agility, speed, interoperability, and simplicity required to tap into the business benefits of technologies such as Artificial Intelligence (AI), digital assistants and Internet of Things (IoT).
- This is why many organizations are turning to SaaS consumption models to more easily “turn on” “pay as you use” subscription models.
- Many organizations and their HR teams are facing new and unprecedented challenges. Most have never operated with remote employees and are looking to find the best solution to make their employees’ work-from-home experience an easy and a productive one.
- **Human capital management (HCM) applications** can help by removing functional limitations and providing high-security platforms that can support business continuity anytime, anywhere and on any device.

Limitations:

- With all of the speed, efficiencies, and innovations that come with cloud computing, there are naturally risks.
- **Security** has always been a big concern with the cloud especially when it comes to sensitive medical records and financial information.
- While regulations force cloud computing services to shore up their security and compliance measures, it remains an ongoing issue. Encryption protects vital information, but if that encryption key is lost, the data disappears.
- Servers maintained by cloud computing companies may fall victim to natural disasters, internal bugs, and power outages, too.
- The geographical reach of cloud computing cuts both ways: A blackout in California could paralyze users in New York, and a firm in Texas could lose its data if something causes its Maine-based provider to crash.
- As with any technology, there is a learning curve for both employees and managers. But with many individuals accessing and manipulating information through single portal, inadvertent mistakes can transfer across an entire system.
- **Maintenance costs:** While the upfront or capital cost for the cloud-based server is very low compared to traditional hosting, the cloud server requires the same amount to be paid each month to maintain both servers as well as data.
- **Internet connectivity:** For cloud-based services, consistent internet connection is important because if any one of the cloud-based service providers loses connectivity, then the company will be out of business until that internet connection returns.
- A common argument from critics is that cloud computing cannot succeed because it means that organizations must **lose control of their data**, such as an email provider that stores data in

multiple locations around the world. A large regulated company, like a bank, might be required to store data in the United States.

Conclusion:

Cloud computing proponents point to it being a new paradigm in software development, where smaller organizations have access to processing power, storage and business processes that were once only available to large enterprises. It has immense potential in the field of E-governance, Telecom, Banking, Manufacturing and other sectors.

Case studies of how cloud computing is helping today:

- **SRL Diagnostics** is an example of how technology can be used to enable business continuity. This laboratory is using Oracle Service Cloud to manage a high volume of queries from their patients coming through to their website, mobile app and calls to the customer service center. Patients can now receive results of any tests within 24 hours via various digital channels like email, etc.
- **Save the Children** is working round-the-clock to make sure that life gets a little easier for underprivileged sections of the society. The NPO is using Oracle ERP Cloud and Oracle Human Capital Management (HCM) Cloud to enable seamless flow of supplies, resources, funds and procurement and make sure that there is no disruption in the relief work.
- **Hindalco Industries**, a flagship aluminium and copper manufacturing company, used to face multiple challenges when it came to seamless collection of data from various locations and then filing financial reports on a real-time basis. Hindalco adopted Oracle Enterprise Performance Management (EPM) Cloud and streamlined their financial management and regulatory reports by utilising the power of data and smart automation in a cost-effective manner.

Awareness in the fields of IT, Space, Computers, robotics, nano-technology, bio-technology and issues relating to intellectual property rights.

Discuss the long standing issues with respect to Intellectual property enforcement and protection in India, suggest solutions to address the same.(250 words)

Reference: [The Hindu](#)

Why this question:

India continues to be on the 'Priority Watch List' of the United States Trade Representative (USTR) for lack of adequate intellectual property (IP) rights protection and enforcement, the USTR said in its Annual Special 301 Report. Thus the question.

Key demand of the question:

Explain the long standing issues with respect to Intellectual property enforcement and protection in India, suggest solutions to address the same

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Present brief description of the current IP regime in the country.

Body:

To start with explain the facts pointed out by the report; India remained one of the most challenging economies for IP enforcement and protection. While India made "meaningful progress" to enhance IP protection and enforcement in some areas over the past year, it did not resolve recent and long-standing challenges, and created new ones.

Discuss the concerns pointed out such as – innovators being able to receive, maintain and enforce patents particularly in the pharmaceutical sector;

Concerns over copyright laws not incentivizing the creation and commercialization of content; and an outdated trade secrets framework.

Suggest solutions to these issues.

Conclusion:

Conclude with way ahead.

Introduction:

Intellectual Property Rights (IPRs) are legal rights, which result from intellectual invention, innovation and discovery in the industrial, scientific, literary and artistic fields. These rights entitle an individual or group to the moral and economic rights of creators in their creation.

India continues to be on the 'Priority Watch List' of the United States Trade Representative (USTR) for lack of adequate intellectual property (IP) rights protection and enforcement, the USTR said in its Annual Special 301 Report, released recently.

Body:

The National IPR Policy (2016) is a vision document that aims to create and exploit synergies between all forms of intellectual property (IP), concerned statutes and agencies. It sets in place an institutional mechanism for implementation, monitoring and review. It aims to incorporate and adapt global best practices to the Indian scenario.

Some of the long standing issues of IPR regime in India:

- Innovators being able to receive, maintain and enforce patents particularly in the pharmaceutical sector; concerns over copyright laws not incentivizing the creation and commercialization of content
- India has an outdated trade secrets framework.
- India also further restricted the transparency of information provided on state-issued pharmaceutical manufacturing licenses, continues to apply restrictive patentability criteria to reject pharmaceutical patents.
- India has still has not established an effective system for protecting against the unfair commercial use, as well as the unauthorized disclosure, of undisclosed test or other data generated to obtain marketing approval for pharmaceuticals and certain agricultural chemical products
- India maintains extremely high customs duties directed to IP-intensive products such as medical devices, pharmaceuticals, Information and Communications Technology (ICT) products, solar energy equipment, and capital goods. These goods categories have been persistent challenges in trade talks between US and India.
- weak enforcement by courts and the police, lack of familiarity with investigative techniques and no centralized IP enforcement agency.
- The USTR also noted that India was ranked among the top five source economies for fake goods by the Organization of Economic Development and Cooperation (OECD) in 2019.
- The government's 2019 draft Copyright Amendment Rules, if implemented, would have "severe" consequences for Internet-content rights holders as the proposed rules broadened the scope of compulsory licensing from radio and television broadcasting to online broadcasting.
- Trademark counterfeiting levels were "problematic" and there are "excessive delays" in obtaining trademarks due to a lack of examination quality.

Measures taken to strengthen the IPR regime in India:

- The statutes governing different kinds of IPRs in India are **Patents Act, 1970; Trade Marks Act, 1999; Designs Act, 2000; Geographical Indications of Goods (Registration and Protection) Act, 1999; Copyright Act, 1957; Protection of Plant Varieties and Farmers' Rights Act, 2001; Semiconductor Integrated Circuits Layout-Design Act, 2000 and Biological Diversity Act, 2002.**
- The **Department of Industrial Policy and Promotion (DIPP)** is entrusted with matters concerning the specialized UN agency on IPRs, the World Intellectual Property Organization (WIPO), including coordination with other concerned Ministries or Departments.
- The **Controller General of Patents, Designs and Trade Marks (CGPDTM)** under the Department of Industrial Policy and Promotion, Ministry of Commerce and Industry is entrusted with the responsibility of administering the laws relating to Patents, Designs, Trade Marks and Geographical Indications within the territory of India.
- The **Protection of Plant Varieties and Farmers' Rights Act, 2001** is a sui generis legislation in India providing protection for plant varieties and rights of farmers and is under the aegis of the Ministry of Agriculture.
- The preservation of biological diversity in India is under the Ministry of Environment and Forests; the **Biological Diversity Act 2002** provides mechanism for regulating access and ensuring fair and equitable sharing of benefits arising out of the use of biological resources and associated traditional knowledge.
- India has always been conscious of its obligations in the international arena, and has acceded to a number of international conventions to further the cause of IPRs globally.

- India was the first country to ratify the **Marrakesh Treaty 2013 for Access to Published Works by visually impaired persons**.
- The accession to the **Madrid Protocol in 2013** is a step towards global alignment for proprietors of marks.
- The **Indian Patent Office** has been recognized as an **International Search Authority** and an **International Preliminary Examination Authority**.
- **The Intellectual Property Appellate Board** hears appeals arising from the decisions of Controllers of Patents as also Registrars of Trade Marks and GIs.

Way forward:

- Fostering an environment where innovation flourishes and a knowledge economy is built, is the key idea. Hence, the policy should have a balance.
- It should encourage patenting and at the same time ensure that patentability of a product/process does not deter further innovation and progress.
- Intellectual Property must not be about patents on paper but dearth of application in reality.
- The organizations such as CSIR and others must be encouraged to work upon socially useful applications of their patents.
- Support for innovation has to be accompanied with instruments that guard local companies against the misuse of market power, coercive bargaining and aggressive acquisition strategies.
- India needs to spread awareness on IPR in public and for its traditional industries to enable fair monetization of IP Rights.
- It needs to safeguard its patents, copyrights and traditional knowledge by ensuring easy IPR rules.

Examine the idea of creation of the 'PPP pandemic patent pool' at a global level, to pool all innovations, also analyse if it is necessary to ensure Intellectual Protection regimes do not outweigh public health interests of the world. (250 words)

Reference: [The Hindu](#)

Why this question:

The question is based on the premise of Vaccine and medicine for COVID-19, and need for a PPP pandemic patent pool.

Key demand of the question:

Explain the significance of 'PPP pandemic patent pool' and in what way it is time to reflect upon the role of intellectual property (IP) in the [ongoing health crisis](#) and dedicate IP to finding a solution.

Directive:

Examine – When asked to 'Examine', we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Present briefly the background of the question.

Body:

To start with discuss what the idea of patent pool implies. Then explain the fact that creating a patent pool will give all countries the right to implement innovations without further permission from patent holders. Explain how it becomes important to ensure Intellectual Protection regimes do not outweigh public health interests.

Conclusion:

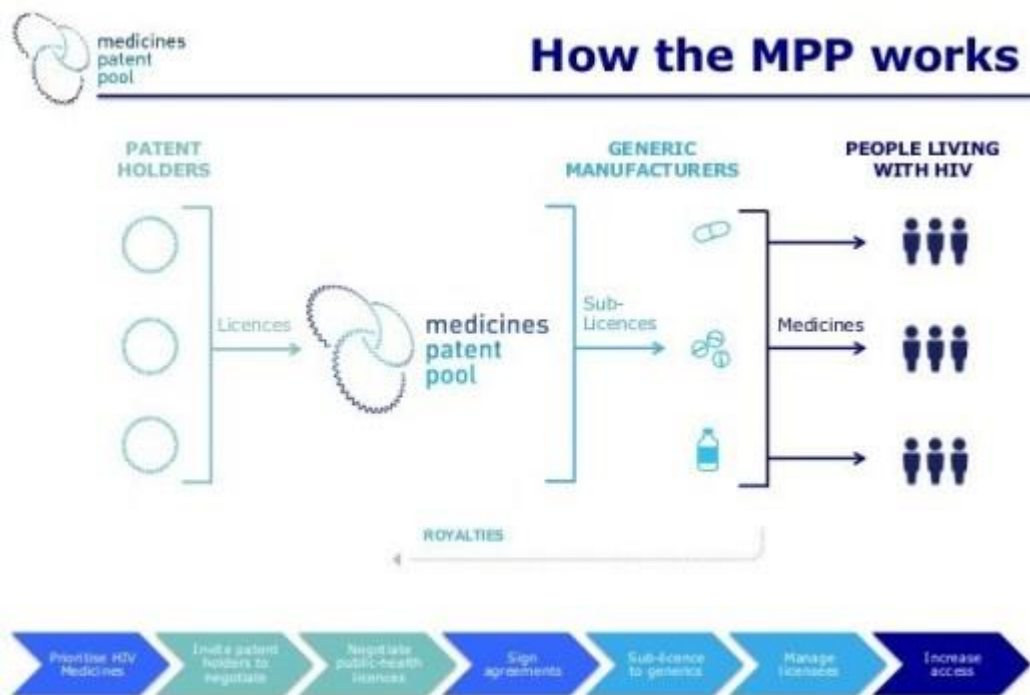

Conclude with significance of the idea of the 'PPP pandemic patent pool' and its relevance.

Introduction:

World Intellectual Property Day, celebrated every April 26, provided us an opportunity to reflect upon the role of intellectual property (IP) in the ongoing health crisis and dedicate IP to finding a solution. The purpose of creating and recognising patent rights is for the common public good, i.e., innovation should be made public in exchange for a limited monopoly. Thus, patents need to be disclosed to the public in order to enable further research.

Body:

Patent rights are detrimental to society:

- With the outbreak of COVID-19, there are several innovations. All these innovations may be the subject matter of patent applications around the world.
- It will be a few years before patents are even granted. However, friction already exists among various stakeholders.
- For instance, one country made attempts to obtain exclusive rights to a vaccine being developed. On the other hand, there are also collaborations taking place.
- However, the spirit of collaborative solutions is only on the anvil. The question that arises is whether the exclusivity that is recognised by patent rights will be detrimental to society.

Covid-19 and patent rights – a use case:

- For human life to become normal again, vaccines or medicines are the only permanent solutions.
- However, even by conservative estimates, it will take at least 6-10 months for any vaccine/drug to be available.
- Even when approval for marketing of a vaccine/drug is granted, it will be impossible for it to be made instantly available across the world.

- This is because even after approval for commercial production is granted, say, in one country, in order for the product to be available to the rest of the world, approvals will be required in each and every country.
- Then countries will have to gear up for instant manufacturing and marketing of the drug.
- For this to happen, continuous dialogue has to take place among innovators, manufacturers and supply chains. This requires massive efforts by private players, governments and international organisations.

Patents – roadblocks or solutions:

- Pandemics need disruptive solutions. Governments and international organisations need to arrive at a consensus in advance to ensure that the system is ready. Procrastination would be disastrous.
- Creating hindrances through exclusivity claims, in the wake of a pandemic, will result in dividing countries, corporations and international organisations.
- This will not benefit patients and the world as a whole. If patent owners create impediments on the strength of patent rights, the world will start despising patents and that is not a situation IP owner ought to be in.
- Under the TRIPS (Trade-Related Aspects of Intellectual Property Rights) regime, there are several tools such as compulsory licensing that are available to ensure access to medicines.
- However, beyond the laws, society needs to respect innovation. To protect the sanctity and integrity of patent systems, and in order to ensure that an anti-IP sentiment is not generated globally, answers need to be found within the existing regime.
- In exceptional circumstances such as these, there is a likelihood that societies may resort to extreme steps to protect themselves. Before such ideas are floated, solutions should be created.

Way forward:

- The purpose of creating and recognizing patent rights is for the common public good, i.e., innovation should be made public in exchange for a limited monopoly.
- Thus, patents need to be disclosed to the public in order to enable further research.
- Public-private partnerships (PPP) need to be scaled up. Creation of the 'PPP-pandemic patent pool' at a global level, to pool all innovations, is the way forward. Let us not wait any longer.
- Pooling of patent resources is also in line with the Doha Declaration on Public Health which is a part of the TRIPS agreement.
- This declaration recognizes the need for taking measures to 'protect public health' and 'promote access to medicines'.

Conclusion:

Creation of a pool and immediate licensing will ensure that there are hundreds of manufacturers across the world. As a result, vaccines and medicines will be quickly available. Such a pool needs the cooperation of not just countries and international organizations but also the hundreds of researchers, innovators, companies and universities involved. Concerns relating to patents and profits to be earned therefrom should be put aside. The world has to come out of this crisis quickly and patents ought to accelerate rather than impede the path. Combating the crisis and earning collectively is the need of the hour.

Conservation, environmental pollution and degradation, environmental impact assessment.

Critically examine the impact of algal blooms on the economies and societies of countries surrounding the Arabian Sea.(250 words)

Reference: [Live Mint](#)

Why this question:

The article talks about New study, entitled Ecosystem state change in the Arabian Sea fuelled by the recent loss of snow over the Himalayan- Tibetan plateau region and brings out insights of the impact of it.

Key demand of the question:

One must present a critical examination of the impact of algal blooms on the economies and societies of countries surrounding the Arabian Sea.

Directive:

Critically examine – When asked to ‘Examine’, we have to look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications. When ‘critically’ is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgment.

Structure of the answer:

Introduction:

From over almost two decades there is exponential spread of tiny plankton i.e. Noctiluca scintillans in the Arabian sea.

Body:

To start with explain what is Algal bloom, Algal bloom is the rapid increase of algae in the fresh and marine waters which depletes the supply of oxygen leading to the death of marine life. This rapid spread of algal bloom has negative implications on the countries around the Arabian Sea. Discuss then the implications of it on the countries surrounding Arabian sea are India, Yemen, Oman, Iran, Sri Lanka, Maldives etc.

Conclusion:

Conclude that thus countries surrounding the Arabian sea have far reaching economical and societal implications due to the massive growth of algal blooms.

Introduction:

An algal bloom or marine bloom or water bloom is a rapid increase in the population of algae in an aquatic system. Algal blooms may occur in freshwater as well as marine environments. Blooms which can injure animals or the ecology are called “harmful algal blooms(HAB)”. Harmful Algal Bloom can lead to fish die-offs, cities cutting off water to residents, or states having to close fisheries.

The new study, entitled Ecosystem state change in the Arabian Sea fueled by the recent loss of snow over the Himalayan- Tibetan plateau region, is an unusually all-encompassing snapshot of the interconnected impacts of climate change.

Body:

Linkage between global warming and algal blooms:

- According to the study, global warming has exerted a disproportionately strong influence on the Eurasian land surface, causing a steady decline in snow cover [in the Himalayas].

- This has disrupted “winter convective mixing” which occurs when cold winter winds blow over the Arabian Sea, driving the surface waters down, which are in turn replaced by nutrient rich waters from below.
- That process allows photosynthetic phytoplankton – the basic building block of our ocean food chain to thrive, along with all the fish species that eventually result in the seafood bounty so many of us rely on.

Effects of Algal Bloom:

- **On economies:**

- HAB events adversely affect commercial and recreational fishing, tourism, and valued habitats, creating a significant impact on local economies and the livelihood of coastal residents.
- Economic concerns associated with HABs include increased drinking-water treatment costs, loss of recreational revenue, loss of aquacultural and fisheries revenue, and livestock sickness or fatalities.
- Taste-and-odor compounds are of particular concern to drinking-water suppliers because of customer dissatisfaction with malodorous drinking water.
- Affects navigation due to increased turbidity, thus impacting the shipping.
- *Case study: The stunning growth in Noctiluca “blooms” has calamitous implications for the economies and societies that surround the Arabian Sea. According to Columbia’s in-house The Earth Institute, “In Oman, desalination plants, oil refineries and natural gas plants are forced to scale down operations because they are choked by Noctiluca blooms, and the jellyfish that swarm to feed on them. The resulting pressure on the marine food supply, and economic security may also have fueled the rise in piracy in countries like Yemen and Somalia.*

- **On Societies:**

- Exposure to algal toxins may occur through consumption of tainted water, fish, or shellfish; recreational activities; or inhalation of aerosolized toxins.
- Algal toxins are known to cause illness immediately (hours to days) after exposure.
- In addition, several algal toxins are believed to be carcinogens or to promote tumor growth, although more research on the effects of long-term exposure is needed.

- **On ecology:**

- Algal Blooms restrict the penetration of sunlight resulting in death of aquatic plants, and hence restricts the replenishment of oxygen.
- The primary consumers like small fish are killed due to oxygen deprivation caused by algal blooms.
- Death of primary consumers adversely affects the food chain and leads to the destruction of higher life forms.
- Loss of coral reefs: Occurs due to decrease in water transparency (increased turbidity).

- **Loss of fresh water lakes:**
 - Eutrophication eventually creates detritus layer in lakes and produces successively shallower depth of surface water.
 - Eventually the water body is reduced into marsh whose plant community is transformed from an aquatic environment to recognizable terrestrial
- **New species invasion:**
 - Eutrophication may cause the ecosystem competitive by transforming the normal limiting nutrient to abundant level. This cause shifting in species composition of ecosystem.
- **Human health:**
 - exposure to Cyanobacteria or their toxins may produce allergic reactions such as skin rashes, eye irritations and respiratory symptoms.
 - The most likely pathway to exposure for humans is through accidental ingestion or inhalation during recreational activities in lakes, rivers and bays.
- A bloom often results in a colour change in the water. Algal blooms can be any colour, but the most common ones are red or brown. These blooms are commonly referred to as red or brown tides.

Impacts on India:

- The stunning growth in Noctiluca “blooms” has calamitous implications for the economies and societies that surround the Arabian Sea.
- The study indicates that countries like India now face an unavoidable reckoning, as the melting of Himalayan and Tibetan glaciers cannot be declined.
- They are central to our weather, food and health security, and feed the rivers that are integral to our culture and identity.

Measures to mitigate eutrophication:

- Treating Industrial effluents domestic sewage to remove nutrient-rich sludge through wastewater processing. Using tertiary sewage treatment methods to remove phosphate and nitrate before discharging the effluent into rivers and lakes
- Riparian buffer: Interfaces between a flowing body of water and land created near the waterways, farms, roads, etc. in an attempt to filter pollution.
- programs to treat wastewater, reduce the overuse of fertilizers in agriculture and reducing the bulk flow of runoff can be effective for reducing severe algal bloom
- Nitrogen testing & modelling: N-Testing is a technique to find the optimum amount of fertilizer required for crop plants. It will reduce the amount of nitrogen lost to the surrounding area.
- Encouraging organic farming.
- Reduction in nitrogen emission from vehicles and power plants.
- Reducing the use of phosphates as builders in detergents
- Aerating lakes and reservoirs to prevent oxygen depletion particularly during algal blooms
- Further, there is a need to monitor the growth of algal bloom using Space technology.

Conclusion:

The algal blooms are threatening food-chains in the regions surrounding Arabian sea. Therefore, countries have to act now, to escape the growing crisis.

Discuss the impact of climate change on the water security of the country and suggest mitigation measures to reduce the impacts.(250 words)

Reference: [The Hindu](#)

Why this question:

The article titled "Water wisdom during a pandemic" brings to us the impact of climate change on the water security of the country.

Key demand of the question:

One must deliberate on the impact of climate change on the water security of the country and suggest measures to mitigate the same.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Discuss in short what is current issue associated with water security in India.

Body:

To start with explain importance of water; Water is the primary medium through which climate change impacts trickle down to the community and individual levels, primarily through reduced predictability of water availability. Then move onto explain the impact of climate change, Increased precipitation and flooding in certain areas and less precipitation and longer and more severe droughts in other areas. Explain the impact all over the geography and expanse of the country. Suggest what needs to be done.

Conclusion:

Conclude with solutions to address the issue.

Introduction:

Climate change impacts the world's water in complex ways. Climate change manifests itself primarily through changes in the water cycle. As climate changes, droughts, floods, melting glaciers, sea-level rise and storms intensify or alter, often with severe consequences. Climate change impacts have direct consequences for water security and conflict.

Body:

The 2020 edition of the World Water Development Report (WWDR 2020) entitled 'Water and Climate Change' aims at helping the water community to tackle the challenges of climate change and informing the climate change community about the opportunities that improved water management offers in terms of adaptation and mitigation.

Impact of climate change on water security:

- The ever increasing dependence on ground water and its continuous excessive exploitation is reducing the ground water level and adversely affecting the quality of drinking water supply, which is a complex challenge.
- Drying of water sources, rapid depletion of ground water table, recurrence of drought and deteriorating water management in different states are presenting different types of challenges.
- Repairs of closed bore pumps, water supply pipelines are not being done on time due to which there is a special crisis in the area.
- Due to the pressure of industrialization and urbanization, the sources of water have been destroyed. This worrying aspect was consistently ignored by various governments.
- Fluoride, nitrate, pesticides, etc. were found to be present in more than acceptable limits in the ground water of most cities and about 19,000 villages. Water quality is challenging in this regard.
- Studies sponsored by the World Bank and UNICEF show that not only is drinking water inadequate in rural India but its imbalance is widespread across the country.
- Waterborne diseases are the biggest health challenge in India. According to official statistics published in the National Health Profile of India-2018, about one quarter or four cases reported in India are due to communicable diseases and one in every five deaths is due to waterborne diseases.
- Water crisis has become a major problem in 30 countries of the world and in the next decade about two-thirds of the global population will face extreme water shortage. In real terms water crisis has become a major challenge in India.

Measures needed:

- **Water efficiency:**
 - Incentivize the wider adoption of sprinkler and drip irrigation by diverting resources otherwise used to subsidize power and surface irrigation.
 - Special emphasis should be laid on desilting of water bodies, including river, lakes, ponds and reservoirs.

▪ **Recycle of waste water:**

- With the country generating 140 bcm of wastewater annually, a pilot scheme to irrigate 10 lakh ha with treated waste water by 2020 may initially be taken up.
- Industries should be encouraged to meet a major share of their demand through recycled water. Besides, programmes for smart water meters and tradable permits for use of recycled water may be launched.

▪ **Water harvesting**

• **Watershed development:**

- The MoWR may develop specific strategies to tap water through watershed development (check dams) in rain-fed areas, expand micro irrigation coverage to 80 lakh ha, and link ground water development to aquifer mapping.
- The timeline for watershed development projects needs to be shortened from seven to four years with special efforts by state governments. Funds available under MGNREGA and state plans may be used for watershed development projects.

• **Rainwater harvesting:**

- Model Building Bye Laws, 2016 circulated by Ministry of Urban Development includes the provision of rain water harvesting.
- Barring the states/UTs of Manipur, Sikkim, Mizoram and Lakshadweep, all states have incorporated the provision in their respective Building Bye Laws.

▪ **Groundwater management:**

- As on date, development of groundwater, i.e., utilization of groundwater resources vis-à-vis replenishable quantity, is 62 per cent. There is a need to develop recharging zones at identified places to make groundwater resources sustainable using check dam, farm ponds, tanks and injection wells.
- Special focus should be placed on the quality of rural drinking water supply in arsenic and fluoride affected areas by tapping multiple sources through conjunctive use of surface water, ground water and rain water harvesting. All new, piped water supply schemes should have mandatory provisions on operation and maintenance involving local communities and stakeholders.

Way forward:

▪ India's priority must be:

- To make our irrigation and water systems amenable to modern concepts.
- To complete irrigation and water sector reforms.
- To implement improved water management, governance and regulation practices.
- Pricing system for water: For making people use water efficiently

▪ Bigger program on water efficiency as energy efficiency – Setting standards for water management.

- Ensuring minimal pollution in both urban areas and industry.
- Fixing India's water crisis will need well balanced policies, meticulous strategy and a massive amount of public participation.
- Sugarcane consumes a disproportionate amount of water and water-stressed regions must make an effort to move away from the crop.
- Comprehensive restructuring of India's Central Ground Water Board and the Central Water Commission in order to create a new 21st Century management authority.
- Right to water should mean a high priority to drinking water.
- India has so far seen the water sector in terms of irrigation projects or water schemes. We need to balance between our water-needs and that of the river itself.

Explain the significance of the Environment Impact Assessment (EIA) process in the Indian context. Also highlight the concerns associated with it. (250 words)

Reference: Green norms must be discussed: Cong. The Hindu

Why this question:

The Environment Ministry has extended the deadline for receiving public comments on the draft Environment Impact Assessment (EIA) Notification 2020.

Key demand of the question:

The question is straightforward and aims to analyse the significance of EIA in the India context along with the concerns associated with it.

Directive:

Explain – Clarify the topic by giving a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

In short define what EIA is.

Body:

To start with explain the details such as – The EIA Notification 2020 is to replace and supersede the 2006 notification. The new EIA Notification proposes fundamental changes in the environmental regulatory regime in India. Bring out the concerns associated- Concept of post facto clearance, Citizens or the civil society cannot report any violations, the construction sector accounts for a large proportion of the greenhouse gas emissions etc.

Conclusion:

Conclude with solutions to address the issue.

Introduction:

Environmental Impact Assessment (EIA) is an important management tool for ensuring optimal use of natural resources for sustainable development. It covers developmental sectors such as industries, thermal power projects, mining schemes etc. EIA has now been made mandatory under the Environmental (Protection) Act, 1986 for 29 categories of developmental activities involving investments of Rs. 50 crores and above.

Body:

Significance of the EIA:

- EIA reports are a critical component of India's environmental decision-making process.

- It acts as a detailed study of the potential impacts of proposed projects.
- It helps in predicting environmental impacts at an early stage in project planning and design.
- Based on these reports, the Environment Ministry or other relevant regulatory bodies may or may not grant approval to a project.
- The EIA reports are also important to define measures that the project could take in order to contain or offset project impacts.
- EIA-based approvals for most projects also involve the process of conducting public hearings, so that who are likely to be affected can be taken on board before approving the project.
- EIA links environment with development. The goal is to ensure environmentally safe and sustainable development.

Issues Related to EIA:

- Environmental decision-making processes for development projects are supposed to use the best available scientific knowledge to ensure that development does not lead to negative impacts.
- But there are compromised decision-making on development and infrastructure projects.
- Sometimes the EIA reports lack the expected degrees of honesty, owing to bias, corruption, exaggeration and wrong claims.
- EIA reports for the approved “redevelopment” projects in Delhi were prepared by copying from copyrighted papers, web-pages and other EIA reports.
- There are many instances of missing or misleading information which understate the potential impact of the projects.
- Many projects are approved without public consultation.
- Lack of awareness among the local people about the process of EIA, its significance for them, their own rights and responsibilities.
- Most of the time EIA reports are unavailable in local languages, thus local people are unable to decipher the reports, and are misled by the proponents
- Expert Appraisal Committees (EAC) is dominated by ex-bureaucrats and institutional experts rather than eminent environmentalists.
- Very little importance is given to socio-economic issues, including those related to gender.
- In the end, it is citizens who have to bear the brunt.

Way Forward:

- Competent authorities must ensure that a project causes minimal adverse environmental impact and generates maximum social and economic benefits.
- Involving affected people and concerned citizens in environmental decision-making has far reaching effects.
- It allows for democratising environmental governance.
- Participatory processes give opportunities to understand and plan for unforeseen effects.
- In 2009, the **Delhi High Court in Utkarsh Mandal v/s Union of India** upheld that it is the duty of the EACs to consider the merits of the objections raised at the public hearings.
- Women and other vulnerable sections of the society are the first and most affected by consequences of developmental processes and damage to the environment.
- Adverse impacts of development projects can be reduced with the full and equal participation of both genders, particularly women in decision-making processes.

- NGOs, civil society groups and local communities need to build their capacities to use the EIA notification towards better decision making on projects.

Conclusion:

An EIA should not be used just as a means for obtaining an environmental clearance; rather, project proponents should use it as a management tool to assess the soundness of a project plan. The focus of EIA needs to shift from utilization and exploitation of natural resources to conservation of natural resources.

Discuss the relationship between climate change and energy security in the context of India, explain the key issues involved and suggest solutions.(250 words)

Reference: pib.gov.in

Why this question:

The question is in the backdrop of the speech rendered by Dr.Anil Kakodkar on the occasion of National Technology Day.

Key demand of the question:

Explain in detail the relationship between climate change and energy security in the context of India, highlight the key issues involved and suggest solutions to address the same.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Start by explaining what you understand by climate change and energy security.

Body:

Highlight the need for dealing with energy needs in the context of climate crisis. Explain the correlation between HDI and Per Capita Energy Consumption. Emphasize on the need to strike a balance between enhancing the quality of human life as well as keeping a control over the climate crisis. Comment on the aspects of action required.

Conclusion:

Conclude by suggesting solutions; explain that interaction between energy security and climate change at a national level can be an important influence on the positions taken by nation states at international negotiations and that there is need to recognise it and work on it.

Introduction:

Climate change and energy security are both global concerns, and both feature routinely in public policy discourses around the world. **India needs a 30-fold increase in renewable energy, 30-fold increase in nuclear energy and doubling of thermal energy, making 70% of energy carbon-free.**

Global climate change is expected to have severe effects on world energy production and consumption. These effects will impact energy security, as well as economic and social security within India. Adaptation and mitigation measures are required to address some of the challenges on energy systems presented by climate change. The challenge before India is how to meet its energy requirements without compromising the ecology of the country.

Body:

Relationship between Climate Change on energy security in the India:

- **Increasing Energy Demand:** Climate change has already started influencing energy demand in most sectors.

- India imports 80 percent of its oil needs and is the third largest oil consumer in the entire world.
 - India's energy consumption is expected to grow 4.5 percent every year for the next 25 years.
 - Recently due to high International Crude Oil Prices, Current Account Deficit (CAD) inflated because of higher cost of oil import, raising concerns about long term economic stability in India, highlighting importance of energy security
 - Air conditioning, urbanisation, increased demand for goods etc are among daily life processes that have increased energy demand to cope with increasingly extreme temperature variations. Energy supply will be affected as the global climate is altered.
 - Also, countries are forced to rely more on energy-intensive methods of providing sufficient water supplies. This effect of climate change drives increasing energy demand and elevates costs.
 - Agricultural practices are affected by temperature changes as farmers become more dependent on more energy-intensive methods in order to maintain productivity levels.
 - Higher temperatures decrease the ability of laborers to work healthily in open-air conditions. Hours of operation for some businesses are therefore changing, for example to earlier or later hours in the day. This change in productivity hours may lead to growing overall energy consumption.
- **Reducing Energy Supply:** Energy supply has been negatively affected by changing weather patterns.
 - As water reservoirs decrease due to lower precipitation and increased evaporation, capacity for electricity production from hydropower and other water-intensive generation technologies may decline.
 - Decreasing water availability can also negatively affect cooling and cleaning systems required for Solar Power, nuclear power, and various other thermal generation technologies.
 - **Impact on energy Infrastructure:** The existing energy infrastructure in India is not designed to cope with the effects of climate change and as a result risks of system failures are manifesting themselves through increasing numbers of energy outages.
 - **Impact on the Transportation sector:** The existing transportation infrastructure is currently not designed to address the challenges of climate change and is not adequate for meeting the expected increasing needs of its societies. Any future incentives for mitigating climate-changing greenhouse gas emissions, such as carbon pricing, electric vehicles will require major changes in the region's energy sector.
 - **Impact on the construction sector:** Climate change is also resulting in important changes in the housing sector as increasing temperatures, particularly in summer months, are also increasing the demand for air conditioning. In the phase of expanding urbanization, with large numbers of new construction projects, it is tough to meet energy demands.

Measures to tackle energy challenge:

- **Increasing accessibility to clean energy:**
 - India has already committed to bring electricity to every household by 2022. An even more ambitious goal would be to provide electricity to all households on 24x7 basis.
 - To bring clean fuel in rural areas the Pradhan Mantri Ujjawala Yojana, should be complemented by: Setting up of biomass pelletising units; and distribution of 'efficient biomass chullahs'.
 - On the agricultural front, solar irrigation pump distribution target must be stepped up and financed through credit support from NABARD and government subsidy.
 - The potential non-conventional energy sources must be explored and researched to make them technologically economical and accessible, like geothermal energy, tidal energy etc.
- **Enhancing efficiency:**
 - The National Mission for Enhanced Energy Efficiency (NMEEE) should conduct a thorough cost-benefit analysis of the available energy-efficient technologies and products across all sectors, especially agriculture, housing and transportation.
 - At the institutional level, the national and state designated agencies working in the area of energy efficiency should be strengthened.
 - To enhance vehicle fuel efficiency gains, the auto fuel quality should be upgraded to BS VI norms for nation-wide launch in 2020.
- **INDIA ENERGY SECURITY SCENARIOS, 2047(IESS)**
 - It has been developed as an energy scenario building tool. The guiding ambition of this is to develop energy pathways leading up to the year 2047, comprising of likely energy demand and supply scenarios.
 - NITI Aayog launched the India Energy Security Scenarios 2047 calculator (IESS 2047), as an open source web based tool.
 - The tool aims to explore a range of potential future energy scenarios for India, for diverse energy demand and supply sectors leading up to 2047.
- **India's Energy diplomacy:**
 - India is setting up a web of energy relationships in the extended neighborhood covering Myanmar, Vietnam in the east, with Central Asian countries like Kazakhstan and Gulf countries in the west.
 - Indo-US Nuclear deal opened new vistas for India in field of Nuclear energy facilitating cutting edge technology and nuclear fuel. India has started to engage with China, Kazakhstan and Australia for nuclear fuel.
 - India's SCO membership could now play a bigger role in ensuring greater energy cooperation between energy producers and consumers by linking Central Asia and South Asia.
- **Promotion of Renewable Energy**

- A renewable energy capacity of 100 GW should be achieved by 2019-20 so as to contribute to achievement of 175 GW target by 2022.
- Solar Energy Corporation of India Limited (SECI) should develop storage solutions within next three years to help bring down prices through demand aggregation of both household and grid scale batteries.
- A large programme should be launched to tap at least 50% of the bio-gas potential in the country by supporting technology and credit support through NABARD by 2020.

Way forward:

- At the national/state level, it will be important for countries to shift to renewable energy sources in their energy mix in order to reduce demand competition for non-renewable sources such as fossil fuels.
- Governments should pay special attention to improving energy infrastructure management and improving planning to cope with the impacts of climate change.
- This will also require appropriate policies and regulatory frameworks that incentivise energy efficiency and behavioural change.
- Governments will need to encourage small businesses' activities in the energy sector, for example by enacting policies that support local-level development of renewable energy sources.
- Incorporating likely climate change effects into energy forecasts and planning will be critical for all countries and international institutions.
- Strengthening cooperation among the public sector, the private sector, and academia would be critical.

Conclusion:

Implementing the above measures and accounting for climate change impacts on the energy sector will continue to be challenging. This transition will take some time. There are various mitigation and adaptation measures that will have to start immediately. The longer the wait, the more pressing the challenges will become for the region, especially for the poorest who have the least ability to adapt.

Account for the impact of COVID-19 Pandemic on Sustainable Development Goals (SDGs). (250 words)

Reference: [The Hindu](#)

Why this question:

The question aims to examine the impact of the COVID-19 pandemic on the Sustainable Development Goals (SDGs) of the world.

Key demand of the question:

The question is straightforward and aims to examine the impact of the pandemic on the SDGs.

Directive:

Account – Weigh up to what extent something is true. Persuade the reader of your argument by citing relevant research but also remember to point out any flaws and counter-arguments as well. Conclude by stating clearly how far you are in agreement with the original proposition.

Structure of the answer:

Introduction:

Explain that besides having a devastating effect on Global Health, the COVID-19 pandemic has adversely affected almost all the SDGs.

Body:

To start with, explain briefly the SDGs and map the concerns posed by the pandemic that range from – health that has a significant place in the 2030 agenda (via SDGs) to education to climate change. Explain that in order to contain the pandemic, various countries have gone for lockdown affecting economic activity. Though everybody is feeling the pinch of a tottered economic activity, the people from lower socio-economic strata are finding it very hard and unaffordable. As the situation is today, hunger, unemployment and inequality stand exacerbated. Children and youth are getting deprived of quality education due to the closure of schools and colleges. The reports of domestic violence against women are on the rise. Suggest what needs to be done. Discuss the case of India.

Conclusion:

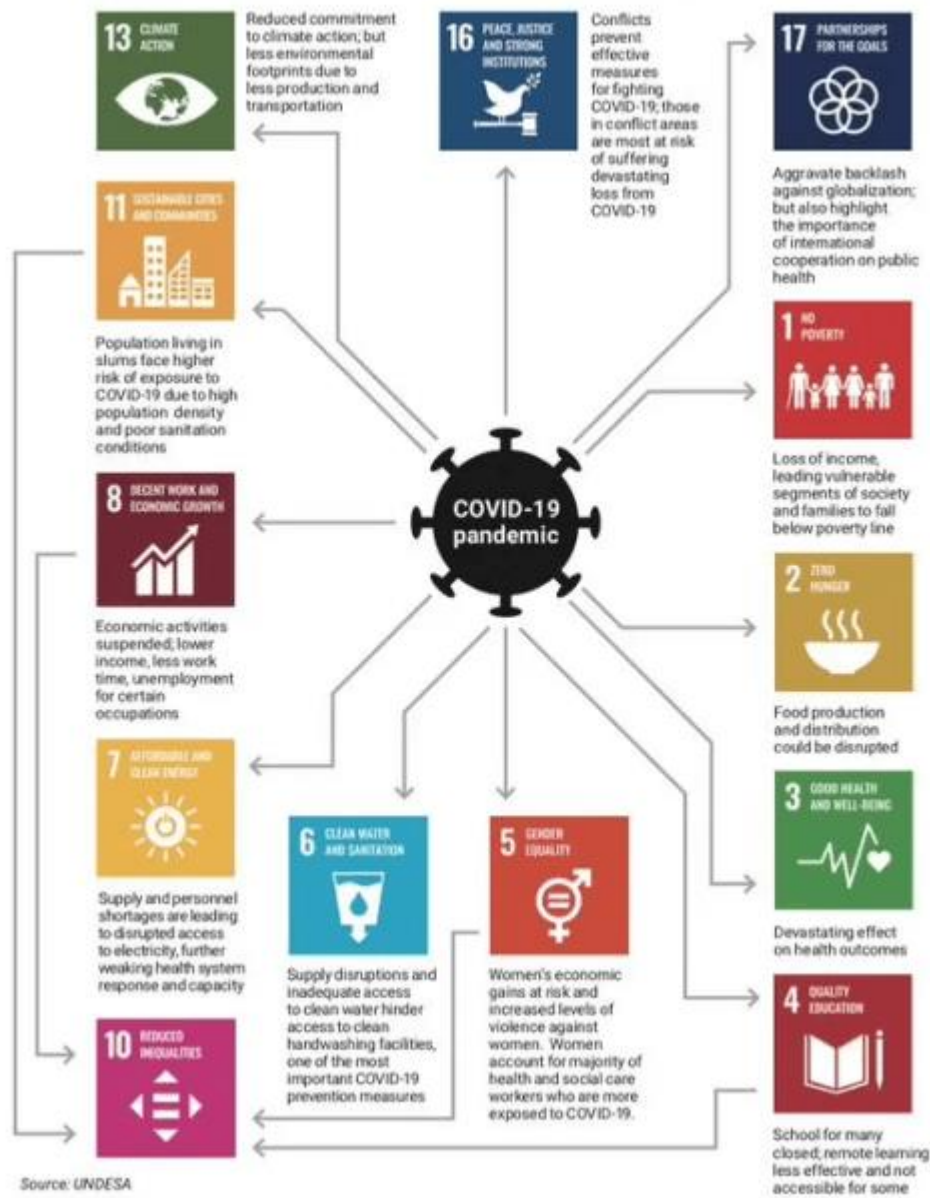

Conclude that to summarize, human health is inextricably linked to environment, ecosystems and biodiversity which in no case be allowed to get spoiled. It has become all the more imperative that in order to achieve SDGs, a population growth which is sustainable and which goes well with our environment, biodiversity and ecosystems be determined and defined.

Introduction

Amid the coronavirus pandemic, the SDGs are even more relevant today than ever before. The primary cost of the pandemic as seen in the loss of human lives is distressing, but the secondary effects on the global economy, on livelihoods and on sustainable development prospects are even more alarming. The International Monetary Fund estimates that our world has entered into a recession, the costs of the pandemic will be astronomical, with preliminary estimates placing it at a whopping US\$2 trillion.

Body

The coronavirus disaster undoubtedly infects the SDGs' Agenda 2030 at the very core. Hence the pandemic poses a major threat of delaying the whole process, which was already facing tremendous hardships in its implementation in the first place due to issues of scarce financial resources and political will, technological impediments and monitoring loopholes.

Impact of COVID-19 Pandemic on Sustainable Development Goals

- **Health:** Although in the present scenario, **SDG 3 (Good Health and Well-being)** acts as the linchpin that supersedes all the other development objectives across the world.
 - This pandemic has manifestly exposed the crisis in global health systems.
 - And while it is severely undermining prospects for achieving global health by 2030, critically it is having direct far-reaching effects on all the other SDGs.
- **Poverty:** Preliminary projections from the UN system indicate that COVID-19 could lead to the first increase in global extreme poverty in over 20 years, since the Asian financial crisis of 1981.
 - It could push 40 to 60 million people into extreme poverty and could double the incidence of food insecurity in the world.
 - In the worst scenario of a 20 percent economic decline, 419 million more people would be living in extreme poverty on less than \$1.90 a day.

- **Marginalization:** Quite inadvertently, marginal groups are more vulnerable than ever – **women, migrants, informal workers, refugees, indigenous tribes**, etc.
 - This in essence comes in direct **conflict** with the **SDGs' social-inclusivity sermon of "leaving no one behind"**.
- **Education:** UNESCO estimates that some **25 billion students** are affected by this pandemic, posing a serious challenge to the attainment of **Goal 4, Quality Education**.
- **Unemployment:** According to the **International Labour Organisation (ILO)** some **25 million people could lose their jobs** with those in informal employment suffering most from lack of social protection during this pandemic. Unfortunately, these might just be the tip of the iceberg.
- **Interlinkage:** Crucially, in many parts of the world, the pandemic and its effects are being exacerbated by the crisis in delivering on **clean water and sanitation targets (Goal 6)**, weak economic growth and the absence of decent work (Goal 8), pervasive inequalities (Goal 10), and above all, a crisis in poverty (Goal 1) and food security (Goal 2).
- The COVID-19 pandemic has temporarily **reduced pollution, emissions and exploitation of resources as a result of lockdown**. But this should not be a moment of reprieve. Rather, recovery efforts need to build a new reality, embedded in sustainability.
- Even at this stage in this deadly pandemic, we cannot deny the fact that the crisis is fast teaching us, as global citizens, the utmost value in being each other's keeper, in working to leave no one behind, and in prioritising the needs of the most vulnerable in society.

Build Back Better

- Priority must be given to placing vulnerable populations at the center of social policy reform packages in the short- and medium-term, including by establishing systems for **universal health care and universal social protection**.
- In the long-term, the note suggests that countries invest in **strengthening social protection and enhancing emergency preparedness** to minimize the impact of future health emergencies and enhance resilience of economies.
- Nations must start investing in **reducing the digital divide**, observing that digital communication has played a key role in enabling social distancing.
- The need of the hour is to bring together development agencies, national governments, civil society and the private sector in a global effort to protect the livelihoods and lives of the poorest of the poor in the Global South

Conclusion

Although the Covid-19 disaster will delay the timeline for the global goals, the SDGs have to stand the test of time to see how global partnerships in the future can make Agenda 2030 successful. While readjusting to the changing world orders after this pandemic, it is of utmost importance for nations to strive toward the SDGs with a renewed vigor, capitalizing on the fact that this huge challenge in the present is an immense learning opportunity for the entire human race in the future.

Account for the current water crisis in India and suggest what India can learn from other countries. (250 words)

Reference: thewaterproject.org

Why this question:

The question is straightforward and aims to assess the current water crisis in the country.

Key demand of the question:

Explain current water crisis in India and suggest what India can learn from other countries.

Directive:

Account – Weigh up to what extent something is true. Persuade the reader of your argument by citing relevant research but also remember to point out any flaws and counter-arguments as well. Conclude by stating clearly how far you are in agreement with the original proposition.

Structure of the answer:

Introduction:

Every year 2 lac Indians die due to inadequate access to safe water while 600 million face extreme water stress.

Body:

With the rise in climatic changes, this issue is likely to get complicated in the coming future. The monsoon rains have become more erratic and droughts becoming common thereby threatening harvest of farmers. It can cripple the livelihoods of an agricultural dominant country where 80% of water is used to irrigate crops like rice and sugarcane. The country's demand is likely to be twice of its supply, resulting in severe water scarcity of millions of people. Explain in detail the current situation. Give examples for efficient water management. Highlight recent steps taken by India. Suggest what lessons we can take from other countries.

Conclusion:

Conclude with way ahead.

Introduction:

The **NITI Aayog report on Composite Water Management Index (CWMI)** said that India is facing its 'worst' water crisis in history. Taps in Shimla went dry in summer of 2018, posing an unprecedented water crisis in the hill town. According to a forecast by the Asian Development Bank, India will have a water deficit of 50% by 2030. Recent studies also ranked Chennai and Delhi at the top of the 27 most vulnerable Asian cities in terms of low per-day water availability. Mumbai and Kolkata follow close.

Body:

India's water crisis is more serious than its energy crisis:

- The water crisis in India is more dire than imagined.
- The annual per capita availability of water continues to decline sharply from about 5,177 cubic metres in 1951 to about 1,720 cubic metres in 2019.
- The NITI Aayog in its report on Composite Water Management Index (2018) has underlined that currently 600 million people face high to extreme water stress.
- Twenty-one cities, including Delhi, Bengaluru, Chennai and Hyderabad will run out of groundwater by 2020, affecting 100 million people.
- Apart from mega cities, many fast-growing small and medium cities such as Jamshedpur, Kanpur, Dhanbad, Meerut, Faridabad, Visakhapatnam, Madurai and Hyderabad also figure in this list.
- The demand-supply gap in most of these cities ranges from 30 per cent to as much as 70 per cent.
- About two lakh die every year due to inadequate access to safe water, about three-fourths of the household do not get drinking water at their premise and about 70 per cent of water is contaminated.
- The rate of groundwater extraction is so severe that NASA's findings suggest that India's water table is declining alarmingly at a rate of about 0.3 metres per year.
- At this rate of depletion, India will have only 22 per cent of the present daily per capita water available in 2050, possibly forcing the country to import water.

- About 81 per cent of India's ultimate irrigation potential, estimated at 140 million hectares, has already been created and thus the scope for further expansion of irrigation infrastructure on a large scale is limited.
- Climate experts have predicted that there will be fewer rainy days in the future but in those days it would rain more.

Causative factors for water crisis:

- A combination of population explosion, unplanned growth of the city and its expansion to some traditional catchment areas (a region from which rainfall flows into a river, lake, or reservoir) have led to a reduction in the natural flow of water, and large-scale deforestation.
- Climate change, leading to much lower precipitation during the winter months. As a result, the natural flow and recharge of water in the region has fallen sharply
- Failure of State governments to check unplanned development and exploitation of water resources. There is no attempt at the central or state levels to manage water quantity and quality
- The vegetation pattern has changed, tree cover is shrinking and unscientific dumping of debris in water streams is rampant.
- The debris blocks the natural course of water bodies.
- Increasing number of tube wells resulting in depletion of groundwater.
- Changes in farming patterns lead to consumption of more water for irrigation and also change the soil profile because of the use of fertilizers
- The states ranked lowest like Uttar Pradesh, Haryana and Jharkhand – are home to almost half of India's population along with the majority of its agricultural produce.
- There is also a **lack of interest in maintaining India's traditional water harvesting structures.**

Measures needed:

- **Structural measures:**
 - Putting in place an efficient piped supply system (without leakage of pipes) has to be top on the agenda.
 - Ancient India had well-managed wells and canal systems. Indigenous water harvesting systems need to be revived and protected at the local level. Examples: Karez, Bawli, Vav etc
 - Digging of rainwater harvesting pits must be made mandatory for all types of buildings, both in urban and rural areas.
 - **Treating the Greywater and reusing it** needs to be adopted by countries like Israel (upto 85%). It could be used to recharge depleted aquifers and use on crops.
 - Initiatives such as **community water storage and decentralized treatment facilities, including elevated water towers or reservoirs and water ATMs**, based on a realistic understanding of the costs involved, can help support the city's water distribution.
 - Technologies capable of converting non-drinkable water into fresh, consumable water, offering a potential solution to the impending water crisis are needed.
Example: **Desalination technologies in Coastal areas, Water-sterilization in polluted water areas.**
- **Non-structural measures:**

- The **World Bank's Water Scarce Cities Initiative** seeks to promote an integrated approach, aims at managing water resources and service delivery in water-scarce cities as the basis for building climate change resilience.
- Groundwater extraction patterns need to be better understood through robust data collection
- Decentralisation of irrigation commands, offering higher financial flows to well-performing States through a **National Irrigation Management Fund**.
- **Public awareness campaigns, tax incentives for water conservation and the use of technology interfaces** can also go a long way in addressing the water problem. **Example**, measures such as water credits can be introduced with tax benefits as incentives for efficient use and recycling of water.
- A collaborative approach like the adoption of a public-private partnership model for water projects can help. **Example**, in Netherlands, water companies are incorporated as private companies, with the local and national governments being majority shareholders.
- Sustained measures should be taken to prevent pollution of water bodies and contamination of groundwater.
- Ensuring proper treatment of domestic and industrial waste water is also essential.

Way forward:

- India's water problems can be solved with existing knowledge, technology and available funds.
- NITI Aayog has prescribed only a continuation of past failed policies.
- India's water establishment needs to admit that the strategy pursued so far has not worked.
- Only then can a realistic vision emerge.

Conclusion:

Primarily water is not valued in India. "People think it is free". In order to meet the future urban water challenges, there needs to be a shift in the way we manage urban water systems.

An **Integrated Urban Water Management approach** must be adopted which involves managing freshwater, wastewater, and storm water, using an urban area as the unit of management.

Discuss the Objectives of Environmental Impact Assessment and bring out its procedure.(250 words)

Reference: Environment by Shankar IAS

Why this question:

The question is straightforward from the static portions of GS paper III.

Key demand of the question:

Explain what EIA is, what its objectives are and bring out its procedure in detail.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Environmental Impact Assessment (EIA) is a process of evaluating the likely environmental impacts of a proposed project or development, taking into account inter-related socio-economic, cultural and human-health impacts, both beneficial and adverse.

Body:

To start with, explain the history of EIA in India. The Indian experience with Environmental Impact Assessment began over 20 years back. It started in 1976-77 when the Planning Commission asked the Department of Science and Technology to examine the river-valley projects from an environmental angle. Then move onto discuss the objectives of EIA in detail. Highlight the procedure involved step by step and assert upon its significance.

Conclusion:

Conclude with its importance.

Introduction:

Environmental Impact Assessment (EIA) is an important management tool for ensuring optimal use of natural resources for sustainable development. It covers developmental sectors such as industries, thermal power projects, mining schemes etc. EIA has now been made mandatory under the Environmental (Protection) Act, 1986 for 29 categories of developmental activities involving investments of Rs. 50 crores and above.

Body:

Recent amendments to EIA:

- All projects or activities in respect of bulk drugs and intermediates, manufactured for addressing various ailments, have been re-categorized from the existing Category 'A' to 'B2' category.
- Projects falling under Category B2 are exempted from the requirement of collection of Baseline data, EIA Studies and public consultation.
- The re-categorization of such proposals has been done to facilitate decentralization of appraisal to State Level so as to fast track the process.

The objective of the EIA:

- To identify, predict and evaluate the economic, environmental and social impact of development activities.
- To provide information on the environmental consequences for decision making.
- To promote environmentally sound and sustainable development through the identification of appropriate alternatives and mitigation measures.
- To identify and quantify emission sources and determine the significance of impacts on sensitive receivers and potential affected uses.
- To identify and quantify any potential losses or damage to flora, fauna and natural habitats.

Procedure of EIA: EIA involves the steps mentioned below. However, the EIA process is cyclical with interaction between the various steps.

- **Screening:** The project plan is screened for scale of investment, location and type of development and if the project needs statutory clearance.
- **Scoping:** The project's potential impacts, zone of impacts, mitigation possibilities and need for monitoring.
- **Collection of baseline data:** Baseline data is the environmental status of study area.
- **Impact prediction:** Positive and negative, reversible and irreversible and temporary and permanent impacts need to be predicted which presupposes a good understanding of the project by the assessment agency.

- **Mitigation measures and EIA report:** The EIA report should include the actions and steps for preventing, minimizing or by passing the impacts or else the level of compensation for probable environmental damage or loss.
- **Public hearing:** On completion of the EIA report, public and environmental groups living close to project site may be informed and consulted.
- **Decision making:** Impact Assessment Authority along with the experts consult the project-in-charge along with consultant to take the final decision, keeping in mind EIA and EMP (Environment Management Plan).
- **Monitoring and implementation of environmental management plan:** The various phases of implementation of the project are monitored.
- **Assessment of Alternatives, Delineation of Mitigation Measures and Environmental Impact Assessment Report:** For every project, possible alternatives should be identified, and environmental attributes compared. Alternatives should cover both project location and process technologies.
 - Once alternatives have been reviewed, a mitigation plan should be drawn up for the selected option and is supplemented with an Environmental Management Plan (EMP) to guide the proponent towards environmental improvements.
- **Risk assessment:** Inventory analysis and hazard probability and index also form part of EIA procedures.

Way Forward:

- Independent EIA Authority and Sector wide EIAs needed.
- Creation of a centralized baseline data bank.
- Dissemination of all information related to projects from notification to clearance to local communities and general public.
- All those projects where there is likely to be a significant alternation of ecosystems need to go through the process of environmental clearance, without exception.
- No industrial developmental activity should be permitted in ecologically sensitive areas.
- Public hearings should be applicable to all hitherto exempt categories of projects which have environmental impacts.
- The focus of EIA needs to shift from utilization and exploitation of natural resources to conservation of natural resources.
- The present executive committees should be replaced by expert's people from various stakeholder groups, who are reputed in environmental and other relevant fields.
- The EIA notification needs to build within it an automatic withdrawal of clearance if the conditions of clearance are being violated and introduce more stringent punishment for noncompliance. At present the EIA notification limits itself to the stage when environmental clearance is granted.
- The composition of the NGT needs to be changed to include more judicial authorities from the field of environment.
- Citizen should be able to access the authority for redressal of all violation of the EIA notification as well as issues relating to non-compliance.
- NGOs, civil society groups and local communities need to build their capacities to use the EIA notification towards better decision making on projects.

Conclusion:

An EIA should not be used just as a means for obtaining an environmental clearance; rather, project proponents should use it as a management tool to assess the soundness of a project plan. The focus of EIA needs to shift from utilization and exploitation of natural resources to conservation of natural resources.

Though India's overall contribution to global climate change is meager, yet it is one of the major countries affected by climate change. In this backdrop, critically analyse major initiatives undertaken by the government for combating climate change?(250 words)

Reference: climate.nasa.gov

Why this question:

The question is based on the current conditions of global climate change.

Key demand of the question:

One has to critically analyse major initiatives undertaken by the government for combating climate change.

Directive:

Critically analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary. When 'critically' is suffixed or prefixed to a directive, one needs to look at the good and bad of the topic and give a fair judgment.

Structure of the answer:

Introduction:

Briefly give statistics supporting how India's overall contribution to global climate change is small.

Body:

To start with, List down major initiatives of Indian government for climate action. For example- NDCs at Paris Agreement, NAPCC, ISA etc. The question also asks to critically examine them, thus students must essentially examine whether India is on the right track of fulfilling its climate targets.

Conclusion:

Conclude by discussing how the current global efforts are inadequate (recall the UNEP Emissions Gap Report) and all countries, especially developed ones, need to ramp up efforts based on the principle of CBDR.

Introduction

India's per capita carbon emissions remain low at only **40% of the global average**, according to a new report by the Paris-based International Energy Agency. Even in absolute terms, the rise in India's CO₂ emissions trails that of the US and China.

Though India is a developing country and has not been historically contributing to climate change, it has pledged a considerable resource to fight climate change.

Body

Impact of Climate Change on India

- **Coastal areas:** 7500 km long coastline is already vulnerable to various **disasters like cyclone, coastal flooding, storm surges, heavy rainfall** (as seen in Mumbai) etc.
 - The rise in the sea temperature and level will only increase the frequency of such hazards endangering the life and livelihood of the coastal population.
 - Also, India being close to the equator will experience much higher increase in sea level than higher latitudes

- **Monsoon:** Phenomenon such as **El Nino will increase the variability** of the monsoon worsening the **agricultural crisis** with more than **50% area still being rain-fed** and threatening the food security.
 - Climate change has about 4-9 per cent impact on agriculture each year.
 - As agriculture contributes 15 per cent to India's GDP, climate change presumably causes about 1.5 per cent loss in GDP(1).
- **Disasters:** More weather aberrations as recently seen in Mumbai and Chennai and increase incidence of the disasters like **flood and drought** will threaten both rural and urban economy
- **Biodiversity:** Loss of biodiversity put the livelihood of the forest dependent and hill communities at risk and disturb the biogeochemical cycles that help maintain the flow of nutrient, water and pure air.
 - Increase in human-wildlife conflict as observed in State like Chhattisgarh and Jharkhand is another threat.
- **Health:** Increased disease outbreaks especially of the **tropical diseases like Malaria and Dengue**, heat waves aggravating the **urban heat island effect** and **water scarcity** compelling people to consume polluted water will increase the burden of mortality and morbidity.
- **Migration:** Rising inequalities as poor will be most affected due to climate change will increase the burden of migration and cripple the urban economies.
 - Illegal migration from the neighbor countries will also cause security threats.

Measure taken to combat climate change in India

- **India's Nationally Determined Contributions**
 - Reduce the emissions intensity of its GDP by 33 to 35 per cent by 2030 from 2005 level
 - 40% of cumulative electric power installed capacity from non-fossil fuel sources by 2030 with financial and technical help from other countries and GCF
 - Additional carbon sink of 2.5 to 3 billion tons of CO2 equivalent by 2030
 - Enhancing investments in development programs in sectors vulnerable to climate change, particularly agriculture, water resources etc.
 - Joint collaborative R&D for such future technologies
- **National Action Plan on Climate Change (NAPCC):** The Action plan covers eight major missions on Solar, Enhanced Energy Efficiency, Sustainable Habitat, Water, Sustaining the Himalayan Ecosystem, Green India, Sustainable Agriculture and Strategic Knowledge on Climate Change.
- **International Solar Alliance (ISA):** ISA was jointly launched by the Prime Minister Narendra Modi, and the then President of France, Francois Hollande in Paris on the side-lines of CoP

21 in 2015. The vision and mission of the alliance is to provide a dedicated platform for cooperation among solar resource rich countries that lie completely or partial between the Tropics of Capricorn & Cancer.

- **State Action Plan on Climate Change (SAPCC):** State governments have drafted climate strategies aligned with the eight National Missions under the NAPCC. The strategies focus on issues ranging from climate mitigation, energy efficiency, and resource conservation to climate adaptation.
- **FAME Scheme for E-mobility:** Union Government in April 2015 launched Faster Adoption and Manufacturing of Hybrid and Electric vehicles (FAME) – India Scheme with an aim to boost sales of eco-friendly vehicles in the country. It is a part of the National Mission for Electric Mobility.
- **Atal Mission for Rejuvenation & Urban Transformation (AMRUT) for Smart Cities :** To make cities sustainable and increasing the green spaces in cities.
- **Environment Impact Assessment:** Management tool to regulate the impact of industries on the environment for ensuring optimal use of natural resources for sustainable development.
 - Applicable for major projects like infrastructure, thermal and nuclear power, industries, mining etc.
 - Industrial categorization (Red, Orange, Green and White) according to their impact to maintain balance between regulation and ease of doing business.
 - White industries do not require EIA approval
- **Pradhan Mantri Ujjwala Yojana:** The scheme provides LPG connections to five crore below-poverty-line beneficiaries. The connections are given in the name of women beneficiaries to reduce their dependence on fossil fuels and conventional fuel like cow dung for cooking food, thus reducing air pollution.
- **UJALA scheme:** The scheme was launched by the Prime Minister Narendra Modi in January 2015 with a target of replacing 77 crore incandescent lamps with LED bulbs. The usage of LED bulbs will not only result in reducing electricity bills but also help in environment protection.
- **Energy Conservation Building Code (ECBC), 2017:** Developed by Power Ministry and BEE, ECBC seeks to promote low carbon growth by integrating the renewable energy sources in the design of the buildings.
 - For a building to be ECBC compliant it has to show at least 25% savings in the energy consumption.
 - It is estimated that adoption of ECBC throughout the country would reduce at least 50% of the energy use by 2030.

Way forward

As pointed out earlier the INDCs submitted by the countries under Paris agreement are grossly inadequate to contain the temperature rise within the desirable limit. In India, rising threats of climate change aggravated by increasing inequality requires a proactive policy that factors in the unique threats to different regions (e.g. floods in the Ganga basing and drought in Vidarbha region)

in the development programs. Following measure are needed in addition to the above mentioned initiatives:

- Addressing the distortion in the cropping towards water intensive crops like rice and promoting agro-climatic farming.
- Increased community engagement in the adaptation measures such as in the Jal Swavlamban Yojana of Rajasthan wherein people are provided incentives to create water storage structures.
- Expansion in the community forestry and Joint forest management to contain the loss to green cover due to industrial activity.
- Decentralized water management through revival of traditional mechanisms like baolis and adoption of eco-friendly methods like 'four water concept' to address the water shortage. Preventing the exploitation of ground water resources.
- Investing in R&D for developing crop varieties more suited to changed climatic conditions (e.g. drought resistant) and diversification of rural economy to reduce pressure on land for agriculture.
- Investments in the agricultural value chain to reduce post-harvest losses and increase the income of farmers.
- Development of better forecasting model and climate change atlas that highlights the challenges for different regions for evidence—based policymaking.
- Increased international collaboration for finances and technology with an outcome based approach.
- Strict enforcement of building code and expansion of rooftop solar power program to reduce dependence on the coal energy.
- Better urban planning focusing on solid waste management and public transport.

Locust invasion can inflict destruction on the lives of thousands of farmers in the country. Discuss the essential measures to combat the pest attack to avert losses. (250 words)

Reference: [The Hindu](#)

Why this question:

The threat of locusts, which have invaded vast swathes of land in Rajasthan and entered neighboring Madhya Pradesh, is bigger this year in comparison with the damage caused to standing crops in a limited area in 2019. Thus the question.

Key demand of the question:

Discuss the issue of Locust invasion and suggest measures to be taken to address the possible losses that they may cause to the agrarian system in the country.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

One can start with facts such as – The tropical grasshoppers have been crossing over to India via Pakistan's Sindh province since April 2020.

Body:

In short talk about the locust storms in general, their onset every year and why it is different this year. Discuss what have been the challenges due to it this year, what it means to farmers and agriculture and food system vis-à-vis security of the country. Suggest what needs to be done to overcome the situation.

Conclusion:

Conclude with way ahead.

Introduction

Indian authorities are helping farmers mount a pesticide spraying campaign to fight the swarms of desert locusts which have already devastated crops across Pakistan and East Africa. About 42,000 hectares (104,000 acres) of cotton, summer pulses and vegetable crops have been affected by locusts across six states, mainly in Rajasthan, said Mohapatra.

Body

Background: About Locust

- The **desert locust (*Schistocerca gregaria*)** is a short-horned grasshopper.
- Harmless when solitary, locusts undergo a behavioural change when their population builds up rapidly.
- They enter the 'gregarious phase' by forming huge swarms that can travel up to 150 km per day, eating up every bit of greenery on their way.
- These insects feed on a large variety of crops. If not controlled, locust swarms can threaten the food security of a country.
- **Reason for Early Arrival:** This can be traced back to the **cyclonic storms Mekunu and Luban** that had struck Oman and Yemen respectively in 2018.
 - These turned large deserts tracts into lakes, facilitating locust breeding that continued through 2019.
 - Swarms attacking crops in East Africa reached peak populations from November, 2019.
 - They built up in southern Iran and Pakistan since the beginning of 2020, with heavy rains in East Africa in March-April enabling further breeding.
- **Institution Responsible:** As a result of the 1926-1931/1932 locust plague, India, under the British Raj at the time, began research into the desert locust, beginning in 1931.
 - It then led to the establishment, in 1939, of a permanent **Locust Warning Organization (LWO)**, with a station in Karachi (undivided India).
 - Its main job was to keep an eye for a specific sub-species of the insect, the desert locust, that sprang into the region from the Thar desert.

Impact of Locus invasion

- **Crop Damage:**

- At present, chances of crop damage are low given that farmers have already harvested their rabi crop.
- Orange growers in Maharashtra have expressed concern but as per scientists of the Agriculture Ministry's Locust Warning Organization (LWO), the swarm in Maharashtra would be easy to control.
- **Burgeoning Population and swarms:**
 - The bigger problem will come once the **present swarms breed**. An adult female locust lays 80-90 eggs thrice in her three-month life cycle.
 - If left uncontrolled, a swarm can grow exponentially to 40-80 million locusts per square kilometre.
- **Destruction of plant growth:**
 - Locusts **attack all sorts of vegetations, including farms, wiping everything** out in their wake
 -
 - Locusts devour leaves, flowers, fruits, seeds, bark and growing points, and also destroy plants by their sheer weight as they descend on them in massive numbers.
 - A small swarm of the desert locust eats on an average as much food in one day as about 10 elephants, 25 camels, or 2,500 people.
- **Past experience:** During the 1940-46 and 1949-55 locust plague cycles, the damage was estimated at Rs 2 crore per cycle, and at Rs 50 lakh during the last locust plague cycle (1959-62).
- **Locust Breeding and Kharif crop:**
 - The locusts will **start laying eggs after the monsoon** starts and continue breeding for two more months, with newer generations rising **during the growth phase of the kharif crop**.
- **Food Security in Peril:** Reports of crop damages have been pouring in from states as farmers try and get rid of locusts by smoking them out, scaring them away by making loud noises or spraying chemicals.
- If locust attacks of this proportion continue unabated, the insects will **wipe out lakhs of tones of food grains and vegetables meant for human consumption**.

Measures to combat Locust Infestation

- A locust attack has to be dealt with by spraying pest control and plant protection chemicals.
- According to the FAO's locust situation bulletin of May 27, adult locusts were forming groups and small swarms in spring breeding areas in Baluchistan, Indus Valley (Pakistan) and southern coast and parts of Sistan-Baluchistan.
- In India, existing groups of swarms have continued to move east and to the central States of Madhya Pradesh and Maharashtra.
- Much of these movements were associated with the strong westerly winds of Cyclone Amphan.

- Several successive waves of invasions are likely until July in Rajasthan, with eastward surges across northern India as far as Bihar and Odisha followed by westward movements and a return to Rajasthan on the changing winds associated with the monsoon.
- These movements will cease as swarms begin to become less mobile. The swarms are less likely to reach Nepal, and Bangladesh and south India, according to experts.

Conclusion

Experience shows that a locust plague usually follows a one to two year cycle after which there is a lull for eight to nine years. However, strong Indian Ocean Dipoles are expected to become more frequent whetted by an overall trend of warming oceans. This phenomenon could trigger regular locust infestations.

Disaster and disaster management.

Is the Disaster Management Act, 2005, ill-suited to be the main economic law of the country? Analyse the need for a pandemic law in the current situation facing the world.(250 words)

Reference: [Business Standard](#)

Why this question:

The author of the article discusses the lacunae in the DMA 2005 from the economic perspectives. And he highlights the need of a Pandemic Act in future.

Key demand of the question:

Explain the need for a pandemic law in the coming future, analyse the gaps in the Disaster management act 2005.

Directive:

Analyze – When asked to analyse, you have to examine methodically the structure or nature of the topic by separating it into component parts and present them as a whole in a summary.

Structure of the answer:

Introduction:

Present brief description of the current situation.

Body:

To start with explain the role of disaster management act, 2005 in the current pandemic situation. Discuss why the economic perspectives are missing in the DMA 2005. Explain the need for pandemic law in the coming future.

Conclusion:

Conclude with what should be the way forward.

Introduction:

The Disaster Management Act, 2005 was enacted to provide an institutional mechanism for drawing up prevention, preparedness and response strategies along with holistic implementation of these measures. National Policy on Disaster Management 2009 further elaborated on its mandate while the National Disaster Management Authority, National institute of Disaster management and a National Disaster Response Force were constituted under the Act.

The Disaster Management Act, 2005 is a poor vehicle for the conduct of economic policy on a nationwide scale. With the Disaster Management Act as the main economic law in motion today, firms will be risk averse out of the threat of incarceration.

Body:

**Role of disaster management act, 2005 in the current pandemic situation:**

- COVID-19 is the first pan India biological disaster being handled by the legal and constitutional institutions of the country.
- To address the current epidemic outbreak, the Central government has included the Covid-19 outbreak as “Notified Disaster” as a “critical medical condition or pandemic situation” .
- Though the Constitution of India is silent on the subject ‘disaster’, the legal basis of the DM Act, is Entry 23, Concurrent List of the Constitution “Social security and social insurance”.
- Entry 29, Concurrent List “Prevention of the extension from one State to another of infectious or contagious diseases or pests affecting men, animals or plants,” can also be used for specific law making.
- As the Indian economy had started out in early 2020 in reasonably poor shape, there was a lot of concern about this combination, of extreme measures impacting upon a weak economy.
- While the much needed restoration of normalcy began on April 18 and has gone forward on May 1, the problem of Covid-19 is not an earthquake or a flood; it is not localized and it will not end quickly.

Economic perspectives are missing in the DMA 2005:

- The use of coercive power of the state has major consequences for the market economy.
- Economic policy works well when the liabilities for violating rules are of a civil nature. All economic actions are conducted in the pursuit of financial gain, and the threat of a fine which is three times the ill-gotten gain suffices in removing the incentive to violate the law.
- But the Disaster Management Act imposes criminal liabilities. This will create a strange dynamic between officials’ vs people.
- Economic policy works well when there is the slow, intellectual, consultative process of understanding problems, undertaking cost benefit analysis, finding the least coercive intervention, and making small moves.
- Such institutionalized application of mind is born of provisions in laws that establish formal processes for wielding coercive power.
- The Disaster Management Act, 2005, does not have these checks and balances, as it was never intended to be a key economic law.
- There are a thousand questions about every element of coercion that need to be clarified through explicit drafting of law, through subordinate legislation and through jurisprudence. That process has not taken place around the Disaster Management Act.
- As a consequence, there are numerous grey areas about what can be done and what cannot be done. There is considerable discretion with millions of officials, all across the country, in deciding who to permit and who to ban.

Way forward:

- India is comparable to the European Union in size and heterogeneity; it makes sense to have highly differentiated approaches that reflect local conditions.
- Rather than a single policy framework for the whole country, we have gone to an approach that respects three different kinds of districts.
- There is great value in local information, local problem solving, and local control of the social distancing restrictions.
- Policymakers need to recognize the complexities associated with major economic policy actions that are implemented at the level of the union government through the Disaster Management Act, and find solutions for these problems.

- While the response of the public health system has been admirable, once the outbreak is contained, Parliament must take immediate steps to review the disaster management laws to create a comprehensive legal regime and appropriate protocols to effectively tackle any future public health crisis.

The recent Vizag chemical leak incident is a wake-up call to ensure industrial safety in the country. Discuss. (250 words)

Reference: [Hindustan Times](#)

Introduction:

The gas leak from a chemical factory in Vizag, which killed 12 people, is the most serious of three industrial accidents that have taken place since the national lockdown was eased on May 3. The other two were in Tamil Nadu and Chhattisgarh. Though the numbers are far smaller, the tragedy brings back memories of the Bhopal gas leak, the worst industrial disaster in the world, which killed at least 3,800 people. The Vizag plant leak was styrene, a benzene derivative used to manufacture plastics and resin.

India's industrial safety record has been patchy at the best of times. Now in the aftermath of the lockdown, it is likely to get further eroded.

Body:

Need for Industrial safety in India:

- What happened in Vizag should be considered a warning for other industries which are resuming operations after a lengthy lockdown. India's industrial safety record has been patchy at the best of times.
- Thirty-six years after the Bhopal disaster, it is distressing to see accidents from hazardous industries.
- The fields of occupational and environmental medicine, toxicology, and epidemiology which study and prevent industrial accidents have still not been developed adequately to cater for the amount of industrial development that has occurred in India.
- Reports suggest that the Vizag plant has functioned without proper environmental clearances for a substantial period since it was set up.
- It must also be asked how the South Korean petrochemical giant, which owns LG polymers, the site of the accident, did not ensure that qualified people were in place to check systems and open the plant.
- A majority of accidents that occur in refineries are the result of human error. Often times a worker fails to follow the safety procedures that have been put into place by the company.
- The common reasons for accidents in chemical plants occur is from improper maintenance of equipment. A piece of equipment can ultimately fail and malfunction if it is not properly maintained. This can be very hazardous for the workers who are operating and working around the machine.
- Every year 48000 fatal accidents occur in India. Only 20% working population was covered under any occupational safety regulation.
- For instance, fire crackers Factory at Batle Punjab claimed 23 lives this year; Sivakashi factory explosion – 2012, 40 died and 70 injured.

Measures needed to strengthen the Industrial safety in India:

- Industries must comply with regulations, and the government must ensure that they are strictly enforced.
- Regular maintenance at scheduled intervals and the manufacturer's recommendations is important to ensure that the equipment runs smoothly and safely.
- Employees should be properly taught on how to operate the equipment in the way it was designed to be used. They should also learn to employ safety procedures when they are operating a piece of equipment.
- Also, employees should be well versed in what to do if something goes wrong so that they can fix it before it gets out of control.

Way forward:

- **The Occupational Safety, Health and Working Conditions Code, 2019**, which unfortunately, successive governments have not felt it necessary to ratify should be taken up and put into place immediately.
- With the ultimate aim of extending the safety and healthy working conditions to all workforce of the country, the Code enhances the ambit of provisions of safety, health, welfare and working conditions from existing about 9 major sectors to all establishments having 10 or more employees.
- It is evident that the Occupational Safety, Health and Working Conditions has some unique new initiatives for both workers and employers.
- It promotes health, safety, welfare and better working conditions of workforce by enhancing the ambit of a dynamic legislation as compared to the existing sectoral approach limited to few sectors.
- Besides, it also drastically rationalizes the compliance mechanism with one license, one registration and one return for the establishments under the ambit of the Code thereby saving resources and efforts of the employers.
- Thus, there is a need to balance the requirements of worker and employer and is beneficial to both the constituents of the world of work.

The complexities in any disaster are associated with social, cultural, economic and political forces; in this context do you think the disaster risk management must thus look beyond the conventional phases of disaster risk management? Examine.(250 words)

Reference: [geography and you](https://www.geographyandyou.com/un-spider.org) , [un-spider.org](https://www.un-spider.org)

Why this question:

The question is based on the theme of disaster risk management.

Key demand of the question:

Explain the complexities associated with any disaster, bring out that the association is not always just about vulnerability or risk associated with a hazard but is also with social, cultural, economic and political forces and thus there is need to thus look beyond the conventional phases of disaster risk management.

Directive:

Examine – When asked to 'Examine', we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Briefly explain what constitutes a disaster.

**Body:**

To start with, explain how the disasters are associated with social, cultural, economic and political forces. One can provide for examples to substantiate better. Explain how disasters are not linear and that they may overlap and occur simultaneously. Highlight the need to consider the fact of moving beyond the conventional definition and recognize these factors in reducing the risks associated with disasters.

Conclusion:

Conclude with importance and suggest way forward.

Introduction:

Disaster is a catastrophic situation in which normal pattern of life and or ecosystem has been disrupted and extraordinary emergency interventions are required to save and preserve lives and or environment. Disaster preparedness means the steps or activities and precautions taken collectively before a disaster to reduce the impact and to cope with it effectively.

Disaster Risk Management is the application of disaster risk reduction policies and strategies, to prevent new disaster risks, reduce existing disaster risks, and manage residual risks, contributing to the strengthening of resilience and reduction of losses. Disaster risk management actions can be categorized into; prospective disaster risk management, corrective disaster risk management and compensatory disaster risk management.

Body:

The **Disaster management cycle** illustrates the ongoing process by which governments, businesses, and civil society plan for and reduce the impact of disasters, react during and immediately following a disaster, and take steps to recover after a disaster has occurred. Appropriate actions at all points in the cycle lead to greater preparedness, better warnings, reduced vulnerability or the prevention of disasters during the next iteration of the cycle. The **complete disaster management cycle includes the shaping of public policies and plans that either modify the causes of disasters or mitigate their effects on people, property, and infrastructure.**

However, the characteristics determined by physical, social, economic and environmental factors or processes increases the susceptibility of an individual, a community, assets or systems to the impacts of hazards. Vulnerability relates to a number of factors, including:

- **Physical factors:** g. poor design and construction of buildings, unregulated land use planning, etc.
- **Social factors:** g. poverty and inequality, marginalisation, social exclusion and discrimination by gender, social status, disability and age (amongst other factors) psychological factors, etc.
- **Economic factors:** g. the uninsured informal sector, vulnerable rural livelihoods, dependence on single industries, globalization of business and supply chains, etc.
- **Environmental factors:** g. poor environmental management, overconsumption of natural resources, decline of risk regulating ecosystem services, climate change, etc.

In addition, **vulnerability is determined by historical, political, cultural and institutional and natural resource processes that shape the social and environmental conditions** people find themselves existing within. These processes produce a range of immediate unsafe conditions such as living in dangerous locations or in poor housing, ill-health, political tensions or a lack of local institutions or preparedness measures.

Vulnerability changes over time because many of the processes that influence vulnerability are dynamic, including rapid urbanisation, environmental degradation, market conditions and

demographic change. Many of these factors are rooted in changing local conditions, but the picture is incomplete without acknowledging the national and global socio-economic and political structures that constrain local development opportunities.

Measures undertaken:

- For each hazard, the approach used in this national plan incorporates the four priorities given in the **Sendai Framework** into the planning framework for Disaster Risk Reduction under the five Thematic Areas for Actions: **Understanding Risk; Inter-Agency Coordination; Investing in DRR – Structural Measures; Investing in DRR – Non-Structural Measures; Capacity Development**
- The **United Nations Office for Disaster Risk Reduction (UNISDR)** was established to ensure the implementation of the International Strategy for Disaster Reduction.
- UNISDR supports the **implementation, follow-up and review of the Sendai Framework for Disaster Risk Reduction** adopted by the Third UN World Conference on Disaster Risk Reduction on 18 March 2015 in Sendai, Japan.
- Such international cooperation and shared commitment are needed to “future-proof” our cities and lock-in resilience for generations to come.
- In India, the **national disaster management plan (NDMP)** was introduced by NDMA based on the Sendai Framework for Disaster Risk Reduction 2015-2030.

Way forward:

- Rather than focusing only on what limits people's ability to reduce their risk, the policy objective of disaster risk reduction (DRR) instead emphasizes understanding people's capacity to resist and recover from disasters, as well as enhancing the overall resilience of people, society and systems.
- The local and traditional knowledge vulnerable communities possess to respond to disasters should form the basis of outside interventions to reduce disaster risk.
- Developing sustainable DRR capacities at national and local level requires that capacity locally generated, owned and sustained whilst also being the concern of society, rather than any single agency.
- Capacity development requires not only building technical capacities (such as environmental management) but also the promotion of leadership and other managerial and functional capacities.
- Finally, capacity development requires an enabling environment i.e. strong political ownership and commitment at the highest level.

The quadruple whammy of Covid-19, the lockdown, migrants' resettlement and the cyclone in the West Bengal underlines the need to relook at the Disaster Management cycle in the country, Examine.(250 words)

Reference: *Hindustan Times*

Why this question:

The question is based on the current situation of super cyclone that has hit the State of West Bengal badly amidst the already existing issues of Covid situation, lockdown and the bigger migration issue.

Key demand of the question:

Explain the need to relook at the Disaster management methods in the country.

Directive:

Examine – When asked to ‘Examine’, we must look into the topic (content words) in detail, inspect it, investigate it and establish the key facts and issues related to the topic in question. While doing so we should explain why these facts and issues are important and their implications.

Structure of the answer:

Introduction:

Briefly explain the current crisis situation.

Body:

To start with, one can present the case study of West Bengal, state key facts depicting the quadruple whammy of Covid-19, the lockdown, migrants’ resettlement and the cyclone. From the article take hints and explain the five points that the author presents which need immediate attention in the country with respect to disaster management.

Conclusion:

Conclude with way forward.

Introduction:

The eastern Indian city of Kolkata has been devastated by a powerful cyclone which has killed at least 84 people across India and Bangladesh. Super cyclone Amphan made landfall on last Wednesday, lashing coastal areas with ferocious wind and rain. Thousands of trees were uprooted in the gales, electricity and telephone lines brought down and houses flattened. To add to the woes of cyclone after-effects, there are increasing cases of Covid-19, continued lockdown in some areas and the resettlement of scores of migrants who are returning back to West Bengal. India, thus, needs a focused approach to cyclical natural disasters

Body:

Disaster wreaked by Cyclone Amphan:

- In less than two days, Bengal lost around Rs 1 lakh crore.
- The cyclone left 80 dead, hundreds of thousands homeless, uprooted trees, ravaged houses, marooned dwellings, knocked out electricity and phone lines, flooded cities and villages, plundered embankments, fencings and boundaries.
- It wreaked ecological destruction and devastation, especially in the eco-sensitive Sundarbans.
- Not least was the ruination of Kolkata’s iconic Great Banyan Tree, among the world’s largest.
- Prime Minister announced a relief package of Rs 1,000 crore (\$132 million) for WB and Rs 500 crore (\$66 million) for Odisha.

The complete disaster management cycle includes the shaping of public policies and plans that either modify the causes of disasters or mitigate their effects on people, property, and infrastructure.

Measures needed:

- There is a need for a genuinely non-discriminatory and equal approach qua all states.
- There is a need for many international agencies to come up with financial assistance like they did during the Gujarat earthquake including the European Union, United States (US) Agency for International Development, Canadian International Development Agency and World Bank (\$300 m) and Asian Development Bank (\$500 m).
- there is a need to exponentially increase government allocation to fight natural disasters.
- random allocation is far less useful than targeted and focused relief measures.
- planned and targeted measures need to be coupled with a robust institutional framework.
- All municipalities must draft their reconstruction plans based on modelling and the plans were based entirely on urban planning, land management, structural mitigation and relocation.

- Such innovations need to be conceptualized in India, much less implemented and even medium-term thinking, much less long-term planning, is conspicuously overwhelmed by short-term ad hocism
- Many countries in their disaster-prone coastal regions have constructed high seawalls to protect vulnerable communities. Odisha's cyclone shelters are a praiseworthy-but-partial achievement, deserving emulation.

Lessons that can be learnt from foreign countries in Disaster Management:

- In the 2011 tsunami-earthquake, Japan allocated \$167 billion for rehabilitation and recovery. It made a five-year plan to do so comprehensively.
- Similarly, the US Congress allocated \$121.7 billion in hurricane relief in 2005 and 2008. Earthquake-prone Iran allocated 2% its national annual budget towards disaster risk reduction, including \$4 billion in 2012.
- Though precise figures for allocation "per head of vulnerable group" are not available, it is clear that comparisons with India on per-affected-population basis yield a dismal picture.
- Japan's targeted five-year plan focused on each stakeholder — from fisheries to housing and power. Knee-jerk reactions in grand mega-announcements after cyclones, without specific sub-allocations, lose their limited vigour and vitality by the time they reach the ground target.
- After 2011, the Japanese government enacted the "Act on the Development of Tsunami-resilient Communities", to efficiently combine structural and non-structural measures to minimise damage.

Conclusion:

We need five "Ps" to cope up with recurring disasters — prominence, as in the role of governments; a pool of funds; planning, especially long-term, of rehabilitation and development; policy qua institutional support; and preparedness qua countermeasures.

Challenges to internal security through communication networks, role of media and social networking sites in internal security challenges, basics of cyber security; money-laundering and its prevention.

The infodemic on social media around Covid crisis calls for a multi-pronged approach. Elaborate.(250 words)

Reference: [Indian Express](#)

Why this question:

The question is amidst the ongoing crisis which is witnessing infodemic on social media around Covid crisis and in what way it calls for a multi-pronged approach.

Key demand of the question:

Explain the issues around Infodemic marring the social media.

Directive:

Elaborate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

Present briefly the current situation.

Body:

To start with explain the fact that with the COVID crisis pandemic there is an accompanied infodemic that needs urgent attention. With various sources (both institutional and individual) attempting to fill the information gaps, we often attend to contradictory information circulating on various social media platforms. Explain the factors responsible for such an infodemic. Suggest solutions to address it.

Conclusion:

Conclude with way ahead.

Introduction:

Infodemic refers to an excessive amount of information concerning a problem such that the solution is made more difficult. Some experts believe that an infodemic, or an excessive amount of both correct and incorrect information, is spreading around the world. The worst-case scenario is that inaccurate information is potentially spreading faster than the virus itself, causing people to make poorly informed decisions. The WHO has declared misinformation and fear as some of the biggest challenges they face with the new coronavirus.

Body:

Challenges posed by Infodemic:

- WHO is leading the effort to slow the spread of the 2019 coronavirus disease (COVID-19) outbreak.
- But a global epidemic of misinformation—spreading rapidly through social media platforms and other outlets—poses a serious problem for public health.
- every outbreak will be accompanied by a kind of tsunami of information, but also within this information you always have misinformation, rumours etc,
- But the difference now with social media is that this phenomenon is amplified, it goes faster and further, like the viruses that travel with people and go faster and further.
- In a country such as India, where 400 million turn to a single messaging app for sharing news and stories about any and everything, more than 240 million are on Facebook and, often, using it as the predominant source of news, a critical mass of misinformation leads to misdirected behaviours.
- In times of crises, cybersecurity is critically important, he stressed, adding that a huge number of people under lockdown or movement restrictions are now working and studying remotely, making them susceptible to cybercrime.
- Some instances are hard to ignore some dominant narratives: Bioweapons origins of the coronavirus (false); Bill Gates was behind it (false); UNICEF's recommendations for warding off infection (unauthorised).

Measures taken up:

- Immediately after COVID-19 was declared a Public Health Emergency of International Concern, WHO's risk communication team launched a new information platform called **WHO Information Network for Epidemics (EPI-WIN)**, with the aim of using a series of amplifiers to share tailored information with specific target groups.
- WHO is also working closely with UNICEF and other international agencies that have extensive experience in risk communications, such as the International Federation of Red Cross and Red Crescent Societies.
- Social-media companies must sort, rank, and prioritize true and reliable information now more than ever.

- Web companies such as Pinterest have already introduced headers and links on their homepages with information about Covid-19, for example.

Way forward:

- Maintaining a system of fact-checking and tough standards regarding COVID-19 and weeding out messages, hashtags and transmitters that fail to meet them.
- The traditional media has a key role in providing evidence-based information to the general public, which will then hopefully be picked up on social media.
- For both social and conventional media, it is important that the public health community help the media to “better understand what they should be looking for, because the media sometimes gets ahead of the evidence”.
- We, as users, have a responsibility to find better ways to seek advice or substitutes for that dopamine rush of sharing a message instantly liked, commented on and shared by others.
- As a society, much like our global response to the coronavirus, we cannot rely on bottom-up decisions.
- We need decisive leadership from the top. In the digital nations we inhabit, Facebook, Facebook-owned WhatsApp, YouTube, Twitter, TikTok, it is imperative that the leaders of these nations act – and act now.
- It is about time, Mark Zuckerberg (Facebook/WhatsApp), Sundar Pichai (Google/YouTube), Jack Dorsey (Twitter) and Zhang Yiming (TikTok) made some tough calls, much like what their own political leaders have done.
- It would be more useful if instead of a coy “Forwarded” note, WhatsApp had a note that said, “For Reliable Medical Advice, Check Out the WHO” or some other trustworthy medical authority

Conclusion:

It is time to step up and help us all practise social media distancing by enforcing stricter standards. Beyond India, the entire developing world relies on your platforms for news about the pandemic. If there ever was a time to demonstrate vision and leadership, this is the time for the digital leaders to flatten the curve of the infodemic before it flattens the most vulnerable populations on the planet.

A comprehensive cybersecurity strategy is needed to foster and sustain trust in the digital ecosystem. Elaborate.(250 words)

Reference: [Financial Express](https://www.financialexpress.com/news/india/india-digital-ecosystem-trust-cybersecurity-strategy-2020-04-28/)

Why this question:

The article explains how a comprehensive cybersecurity strategy is needed to foster and sustain trust in the digital ecosystem.

Key demand of the question:

Explain the need for a comprehensive cybersecurity strategy to foster and sustain trust in the digital ecosystem of the country.

Directive:

Elaborate – Give a detailed account as to how and why it occurred, or what is the particular context. You must be defining key terms where ever appropriate, and substantiate with relevant associated facts.

Structure of the answer:

Introduction:

One can start by explaining the importance of security of cyberspace for India.

Body:

To start with explain the fact that the security of cyberspace is important not only because of the actions of individual participants but because the infrastructure of cyberspace is now fundamental to

the functioning of national and international security systems, trade networks, emergency services, basic communications, etc. Then move on to explain the need for a comprehensive cybersecurity strategy. List down points in favour. Bring out challenges if any.

Conclusion:

Conclude with its importance for India in multiple dimensions.

Introduction:

With the vision of a trillion-dollar digital component, accounting for one-fifth of the \$5-trillion national economy, the importance of cyberspace in India would only keep growing as Indians have taken to mobile broadband like fish to water, driven by affordable tariffs, low-cost smartphones and a spurt in availability of audio-visual content in Indian languages.

Cyber security is a broad spectrum phrase and relates to preventing any form of unauthorized and malafide access to a personal computer, a laptop, a smartphone or a major network like the national banking system or the railway network or a national information technology asset that also has military implications.

Body:

Need for strong cybersecurity strategy:

- More than 4,000 fraudulent portals emerged within two months, and on a typical day in April 2020, Google alone blocked 240 million spam messages and 18 million phishing scams.
- Cybersecurity incidents observed by the Indian Computer Emergency Response Team (CERT-In) went up almost four times from 2017 to 2018, while cybercrimes went up by 77% from 2016 to 2017. Unsurprisingly, India's global rank on the cybersecurity index slipped to 47 in 2018 from 23 in 2017, according to the UN agency ITU (International Telecommunication Union).
- A 2017 study conducted by Symantec found that India ranked fourth in online security breaches, accounting for over 5 per cent of global threat detections. In the beginning of 2017, the newly launched Bharat Interface for Money application (BHIM app) reportedly faced spam threats.
- The real danger to India lies in targeted cyber-attacks coming from adversarial nation states.
 - Countries like China can bring immense assets to bear in carrying out sophisticated cyber-attacks. The success of Stuxnet, which damaged the Iranian centrifuge facility at Natanz is an example.
- There is a push towards greater digital dependence with demonetization a cashless system is being propagated. Aadhaar and the wider platforms such Digital India and Smart Cities will push things further along. India is the world's second largest digital nation with more than 350 million Indians are online and millions more will be getting connected in the years to come.
- Criminals can defraud unsuspecting users in sharing their bank or credit card account details with the PIN and passwords, intimidate and bully others, indulge in cyberstalking or, for that matter, could be involved in cyberespionage, terror financing or child pornography.
- Operations of critical infrastructure such as power grid or ports can come to a halt with ransomware, and fake news can flare up social tensions.
- India is not even a signatory to some of the basic international frameworks on Cybersecurity like the Convention of Cybercrime of the Council of Europe which not only European nations but Japan, US, South Africa have become signatories to, except India.

- Indian laws are not in tandem with the ever-changing global cyberspace.
 - The laws are old and hence need to be more dynamic in nature to deal with issues like cyber-espionage, data theft and so on.
 - The Information Technology Act, 2000 (IT Act 2000) is the sole law that deals with cyberspace in India and was passed way back in 2000.
- Also, the Cyber Law of India has been subject to amendments on various occasions but hasn't served the changing dynamics and the growing threats and manifestations of cyberwar.

Strategy should include the following:

- Since a global consensus is unlikely any day soon, India should consider joining or leveraging existing frameworks like the Convention on Cybercrime and the Paris Call. After all, cybersecurity has become a geopolitical issue, as reiterated time and again by the Prime Minister.
- **Security by design, budgeting by default:**
 - It is high time that 10% of every IT budget in the government be earmarked for cybersecurity, as recommended by the NASSCOM Cyber Security Task Force, just like 1-3% of every ministry's budget was set aside for IT in 1998, as recommended by the Prime Minister's IT Task Force in 1998.
 - The National Cyber Security Strategy (NCSS) 2020 and the data protection framework must be consistent with each other.
 - Exceptions and exemptions must be narrowly crafted, in compliance with the principles of lawfulness, fairness, transparency and proportionality laid down by the Supreme Court in its 2017 privacy judgment.
- **Prevention is better than cure:**
 - Nine out of 10 data breaches can be mitigated if we all take care of basic cybersecurity like using licensed and updated software, using different and difficult passwords for different services and devices, multi-factor authentication and strong encryption.
 - We need innovative solutions to scale up awareness as our user base is expected to reach a billion over the next five years, compared to half a billion currently.
- **Bidirectional partnership:**
 - The government should share its own assessment back with the private sector to create incentive for the latter to proactively share their intelligence on threat vectors without jeopardizing contractual obligations or intellectual property.
- **Pragmatic, predictable, flexible**
 - Underlying principles must go along with the strategic objectives and provide sufficient guidance and flexibility to sector regulators within their respective ecosystem.
 - For example, the cybersecurity guidelines or frameworks issued by RBI, SEBI, IRDAI and PFRDAI can be greatly synergized under the aegis of the Financial Stability and Development Council (FSDC), thereby bringing greater sanity for the regulators as well as the regulated entities.
 - In addition, every regulation must emerge through public consultation and be backed up with a regulatory impact assessment, whether it is about cross-border data flows or restricting encryption.

Measures needed:

- **A Defence Cyber Agency** could be the first step the government plans to for critical infrastructure and military networks that are increasingly becoming dependent on the Internet, thus increasing vulnerabilities.
- The Defence Cyber Agency will work in coordination with the National Cyber Security Advisor. It will have more than 1,000 experts who will be distributed into a number of formations of the Army, Navy and IAF. According to reports, the new Defence Cyber Agency will have both offensive and defensive capacity.
- Equally important is **cyber propaganda**. During the Doklam conflict, China tried its best to unleash cyber propaganda on India and indulged in complex psy-ops
- **Critical cyber infrastructure** needs to be defended and the establishment of the **National Critical Information Infrastructure Protection Centre (NCIIPC)** is a good step in this direction
- Individual ministries and private companies must also put procedures in place to honestly report breaches. It is only then that the NCIIPC can provide the requisite tools to secure these networks. This partnership must be transparent and not mired in the usual secrecy of intelligence organizations.
- The **upgrading of the Defence Cyber Agency to a Cyber Command** must be implemented at the soonest.
- A robust ecosystem must be built to secure India from acts of state and non-state actors, including protocol for grievance redressal in international forums.
- Better capabilities must be built to detect and deflect attacks.
- The **computer emergency response team (CERT)** must be strengthened and aligned with military and foreign affairs operations.
- Building a joint task force between the government and key technology players will be crucial.
- The government should push for the creation of a **global charter of digital human rights**.
- **A national gold standard** should be created, which ensures that Indian hardware and software companies adhere to the highest safety protocols
- Impart cybercrime investigation training and technological know-how to the various law enforcement agencies.
- **Cyber awareness** must be spread and there should be multi-stakeholder approach- technological inputs, legal inputs, strengthening law enforcements, systems and then dealing with transborder crime involves lot of international cooperation.

Conclusion:

Most of the Indian banking industry and financial institutions have embraced IT to its full optimization. Reports suggest that cyber-attacks are understandably directed toward economic and financial institutions. With innovative, technology led programmes such as AADHAAR, MyGov, GeM, Digital Locker the new India is the land of technological prowess and transformation. Government and the private sector jointly have to give cyber security some priority in their security and risk management plan.

Discuss the initiatives and measures that social media platforms and companies must make to self-regulate themselves so as to ensure information hygiene.(250 words)

Reference: [The Hindu](#)

Why this question:

The article talks about the importance of maintaining information hygiene by the social media platforms and importance of self-regulation in doing so.

Key demand of the question:

Explain in detail the initiatives and measures that social media platforms and companies must make to self-regulate themselves so as to ensure information hygiene.

Directive:

Discuss – This is an all-encompassing directive – you have to debate on paper by going through the details of the issues concerned by examining each one of them. You have to give reasons for both for and against arguments.

Structure of the answer:

Introduction:

Briefly explain the current conditions and issues with respect to social media platforms and companies like facebook, Instagram etc.

Body:

One can start by explaining what you understand by information hygiene. Present the issues or problems posed by social media platforms such as filter bubbles, echo chambers, information silos, viral virus, misogynist trolling and amplification of toxic content etc. Narrate any recent incidents that explain the context of the question better. Discuss what practices of self-regulation the media platforms and companies must take.

Conclusion:

Take hints from the article and conclude with what needs to be done to overcome such issues.

Introduction

The term “social media” refers to internet-based applications that enable people to communicate and share resources and information. While they have enabled faster communication, there are many challenges, of which information hygiene is the most important.

We live in an age of **infodemic**, where there is a lot of data to consume; but at the same time the veracity of claims made by the information is not factually true. This leads to fake news and mass hysteria.

Body

Challenges faced due to social media and it's content

There are more than **500 million internet users** in India and today social media is not only a subset of internet rather the internet itself.

- **Weakens the democracy:** Fake news poses a serious challenge to this proposition as it misleads the consumers of information, poses a threat to a democratic society as it can give a handle to the state to interfere with the functioning of media.
 - For instance, Facebook took a hammering over **Russia's interference in the 2016 U.S. election.**
 - It conceded the following year that up to 10 million Americans had seen advertisements purchased by a Russian agency.
- **Affecting choices and behaviours:** These platforms are predominant source of news and a critical mass of misinformation leads to mis-directed behaviours filled with fake news and disinformation aimed at influencing choices ranging from day to day life to political choices made during the Indian elections.
- **Threat of infodemic:** The WHO warns that societies around the world are facing an “infodemic” —an “overabundance” of information that makes it difficult for people to identify truthful and trustworthy sources from false or misleading ones.

- **Accountability issues:** Challenges with respect to fixing the liability of intermediaries. It is also difficult to trace the origin of fake news circulation.
- **Jurisdictional challenges:** Complications in jurisdiction as Facebook, twitter etc. operate as subsidiaries of foreign internet companies with their servers located outside India.
- **Anonymity:** Police officers have expressed concern over multiplicity of fake profiles. There is no accountability of a crime.
- **Encrypted Message:** Use of **WhatsApp** to send and receive messages, concerns the government because the communications sent via such devices and applications are encrypted.
- **Spread hatred and mistrust:** False information propagated through fake news have helped people developing racist and **xenophobic sentiments** against people of Asian origin around the world, as we saw in the case of Corona epidemic. Such messages can often be a means of reinforcing existing prejudices.

Measures being taken for regulation and information hygiene

- The social media conglomerate has also launched a **content oversight board**, which will be able to overturn decisions by the company and Chief Executive Mark Zuckerberg on whether individual pieces of content should be allowed on Facebook and Instagram.
- Google has launched its Google News Initiative to help journalism thrive in the digital age.
- The world's biggest social media companies, including Facebook, Google, Twitter and ByteDance, are exploring an **industry-wide alliance** to curb fake news on their platforms in India.
 - The proposed alliance — to be named the **Information Trust Alliance (ITA)** — will be a grouping of digital platforms and publishers, fact checkers, civil society and academia that will aim to control the spread of harmful content, including fake news and hate speech.
 - **Facebook** has announced that it currently has over 500 full-time employees and at least 3,500 external contractors who focus on election work, on top of the 30,000 people across the company focused on safety and security issues.
- Coordinated attempts to amplify and spread misleading and false information sometimes seem to emanate from major political parties and activists who support them. **Election Commission of India** must tie up with tech companies to identify the creator of such news.
- **Educating the end-users** to be more discerning consumers of news by informing them of verification tools so that they can ascertain the accuracy of a news item before sharing it.
- **Press Council of India**, a regulatory body, can warn, admonish or censure the newspaper, the news agency, the editor or the journalist or disapprove the conduct of the editor or the journalist if it finds that a newspaper or a news agency has violated journalistic ethics.
- A better and more effective approach to limit the influence of hoaxes on WhatsApp and other platforms is to increase **media literacy**.
- The government should bring out a policy framework on the possible harm due to the internet messaging platforms to engage at a deeper level.
- Government of India could partner with local news groups to further educate citizens on how to identify real news from fake news.

- Imposing hefty fines, like in Germany the Social media companies face fines of up to €50m if they persistently fail to remove illegal content from their sites.

Way-Forward

- **Promoting the culture of authenticity:** The people who consume the data on an everyday basis educate themselves and acquire the skills to tackle it.
 - There is a need to shift towards a system where self- verification of information is an 'internet skill' and an important duty.
 - This can be done simply by a quick search on Google, or checking for that information or visiting the official websites to verify the accuracy of the data.
- **Responsible citizenry:** Consumers who play the central role in the spread of misinformation, are also the most efficient and effective in debunking the various myths and fake news. This skill can be taught via:
 - Creating awareness on television and social media, or
 - Innovative initiatives like 'Fake News Classes' introduced in government schools in Kerala, where they teach students how to identify and spot misinformation.
 - By asking questions like "What is the source of that (post/forward)?" before sending it to other people.
- **Proactive web monitoring:** The Mumbai Police has launched a project called "Social Media Lab" to check explosive content on various platforms and quell fake news.
 - Initiatives such as 'WhatsApp's Checkpoint Tipline', 'The Logical Indian' should create user awareness regarding fake news.
- **Crisis Protocols:** Creating a crisis protocol for responding to emerging or active events, on an urgent basis, so relevant information can be quickly and efficiently shared, processed, and acted upon by all stakeholders with minimal delay.
- **Global cooperation: Christchurch Call of Action** outlined voluntary commitments from governments, ISP's to address issue of violent extremist content online. India is a signatory to this plan
